A REPRINT

OF THE LAST (1880) EDINBURGH AND LONDON EDITION

OF CHAMBERS'S ENCYCLOPAEDIA,

With Copious Additions by American Editors.

FIFTEEN VOLUMES,

VOLUME X.

New York:
AMERICAN BOOK EXCHANGE,
764 BROADWAY,
1881.
This work, although based upon Chambers's Encyclopædia, whose distinguished merit is widely known, differs from it in important respects. It could scarcely be expected that an Encyclopædia, edited and published for a foreign market, would give as much prominence to American topics as American readers might desire. To supply these and other deficiencies the American Editors have inserted about 15,000 titles, arranging the whole, including Chambers's Supplement, in a single alphabet. The total number of titles is now about 40,000. The additions give greater fullness in the departments of biography, geography, history, natural history, and general and applied science. Scrupulous care has been taken not to mutilate or modify the original text of the edition of 1880; no changes have been made except such verbal alterations as are required by the omission of the wood-cuts. The titles of articles from Chambers's Encyclopædia, either from the main work or from the Supplement, are printed in bold-faced type—AMERICA. The titles of the American additions, whether of new topics or of enlargements of the old, are printed in plain capitals—AMERICA. Should it appear that an article from the English work and its American continuation disagree in any points, the reader will readily refer the conflicting statements to their proper sources.

The labor of consultation will be much reduced by the catch-words in bold-faced type at the top of the page, being the first and last titles of the pages which face each other; and by the full title-words on the back of the volume, being the first and last titles contained therein.

The word ante refers to Chambers's Encyclopædia, as represented in this issue. Whenever the word (ante) follows a title in the American additions, it indicates that the article is an enlargement of one under the same title in Chambers's Encyclopædia—usually to be found immediately preceding.

MINNESOTA, one of the United States, lies in lat. 43° 30' to 49° n., and long. 89° 29' to 97° 5' west. It is 350 m. in extreme length from n. to s., and from 181 to 337 from e. to w., containing an area of 83,531 sq. miles. It is bounded on the n. by the British possessions, from which it is separated by the chain of lakes and rivers connecting the lake of the Woods with lake Superior, and by the 49th parallel of latitude; e. by lake Superior and Wisconsin; s. by Iowa; and w. by Dakota territory (q.v.), from which it is partly divided by the Red river of the north. It contains 75 counties, and its chief towns are St. Paul, the capital, Red Wing, Winona, Hastings, Minneapolis, etc. Minnesota contains the summit of the central table-land of the North American continent, where, within a few miles of each other, are the sources of rivers which find their outlets in Hudson's bay, the gulf of St. Lawrence, and the gulf of Mexico. The state is abundantly watered by the Mississippi, Minnesota, Red river of the north, Rainy Lake river, and their branches, and has more than 1,500 m. of navigable rivers. The country abounds also in lakes and ponds. The sources of the great rivers are 1,650 ft. above the level of the sea. Though the most northerly state in the union, Minnesota is one of the most beautiful, fertile, and salubrious. The winters are long and cold, but equable, and the country is rich in fertile lands and forests. The clear waters are stored with fish, and game is abundant. The scenery is varied and beautiful. The falls of St. Anthony on the Mississippi afford abundant water-power. Near these is the beautiful cascade of the Minnehaha, or laughing water, 45 ft. perpendicular, and a cavern, explored to the depth of 1,000 feet. Minnesota began to be settled in 1815, though it was explored by the French and trading-posts established in 1680. The chief route to the British settlements of the Red river of the north lies through Minnesota. The state has plenty of good timber, and is rich in minerals, including gold, iron, copper, coal, and lead. In 1857 its agricultural products were valued at $83,446,400. In the same year it had 6 universities and colleges, and 2,424 public schools. In Jan., 1873, 1940 m. of railway were completed, and about 1000 more projected, towards which grants of land have been made to the extent of nearly $4,500,000. Powerful Indian tribes occupy portions of the state. The state government was organized in 1858. Pop. 60,172,023; in 70,439,706.

MINNESOTA (contd.) In 1680 a party of French fur-traders ascended the Mississippi to the falls of St. Anthony, where they formed a settlement. Louis Hennepin, a Franciscan priest, accompanied them, and gave the falls the name which they have since borne. This was the first white settlement made within the limits of the state, and it soon degenerated by the adoption of Indian manners and habits. In 1763 the territory was ceded to Great Britain; in 1766 it was explored by capt. Jonathan Carver, of Connecticut; and in 1783 it became a part of the United States, and was included in the northwest territory. In 1805 a tract of land at the mouth of the St. Croix and another at the mouth of the Minnesota were purchased of the Indians, but the region was settled slowly. In 1820 fort Snelling was built, and two years later a mill was erected on the site of Minneapolis. In 1823 the first steamboat ascended the Mississippi to the falls of St. Anthony. Some time before 1830 a small colony of Swiss settled near St. Paul. It was not until 1838 that the Indian title to lands e. of the Mississippi was extinguished, and a settlement was commenced at Stillwater in 1842. In 1849 the territory of Minnesota was organized by act of Congress, the w. boundary being the Missouri river. The population of the territory at this time did not exceed 5,000. Two years later the Indian title to the lands (except the reservations) between the Mississippi and the Red river of the north was extinguished, and from this time the settlement of the territory was rapid, immigrants pouring in so fast that in 1857 congress opened the way for its organization as a state, and it was admitted to the union May 11, 1858. The new state grew rapidly in population, wealth, and intelligence. After the breaking out of the rebellion, 1861, the Sioux Indians, taking advantage of the absence of great numbers of able-bodied citizens, attacked the new settlements, massacring families, burning villages, and driving the almost defenseless inhabitants from their homes in a state of utter destitution. The assault had for excuse the injustice which has marked the whole history of the United States in its dealings with the Indians; but there could be no justification for the savage
cruelties inflicted upon the whites, nearly 1,000 of whom perished. The outbreak was speedily and effectually suppressed, and the tribe removed from the state. There is still in the state a considerable body of friendly Chippewas, dwelling upon several reservations and making no trouble.

The surface of the country is, for the most part, undulating, with no mountain ranges, but the rolling prairie is in the northern part, which divides the waters flowing toward the Mississippi from those which empty into Hudson's bay, and both these from those which find their way to the Atlantic through the St. Lawrence. The divide at its highest point of elevation is not more than 100 ft. above the adjacent country, though it is 1,800 ft. above the ocean, and nearly 1,000 ft. above the extreme s. part of the state, the descent toward which is so gradual as hardly to attract observation. Three-fourths of the state are rolling prairie, interspersed with oak openings, belts of timber, and innumerable small lakes, and drained by numerous streams of clear water. The remaining fourth includes the divide above-mentioned, the mineral tract near lake Superior, and the heavily wooded region around the sources of the Mississippi and the Red river of the north. The state is mostly drained by these two rivers, by the St. Louis, and their numerous tributaries. The chief affluents of the Mississippi are the Minnesota (itself a noble river, with numerous branches), the Root, Zambrota, Cannon, Sauk, Crow Wing, Willow, St. Croix, and Rum river, the outlet of Mille Lacs lake. The Red river has several branches—the Buffalo, Wild Rice, Red lake, etc.; while the Us-kawwaka, Big White Face, Stone, Floodwood, and Savannah are tributary to the St. Louis. A multitude of small streams flow into lake Superior, while the Vermillion, Little Fork, Big Fork, and others discharge into the Rainy Lake river and the chain of lakes which form a part of the n. boundary of the state. The Mississippi is navigable within the state for 540 m., the St. Croix for 53 m., the Minnesota at high water for 300 m., the Red river for 250 m., and the St. Louis for 21 miles. One thirty-fifth of the entire area of the state is covered with lakes. The largest of these are Leech, Red, Mille Lacs, Vermillion, Winnibegoshish, Big Stone, Traverse, Cass, Otter Tail, and Itasca. The navigable waters of the state have a shore line of 2,700 miles.

Iron and copper ore of excellent quality are found in the section bordering upon lake Superior, and iron also in the s. and s.w. portions of the state. Gold and silver in moderate quantities are found in the neighborhood of Vermillion lake, but the region is so wild and inaccessible that the mines are not worked. The n. portion of the state, along the Red river valley and the basins of the lakes and streams which form the n. boundary, is one of the finest wheat-producing regions in the world. The prevailing forest growths in this region are the oak, beech, elm, and maple. The n.e., or mineral, portion of the state is less productive, though it yields fair crops. Much of it is covered with a heavy growth of pine, spruce, and other woods valuable for timber. The three-fourths of the state lying s. of the highlands is a country of unsurpassed fertility. About one-third of all the land surface of the state is covered with forest. A tract on both sides of the Minnesota river, over 100 m. long and of an average width of 40 m., is known as the Big Woods, wherein are almost every species of deciduous trees found anywhere in the northern states. On the prairies have been planted more than 20,000,000 of forest trees, the state tempting the owners of the land to this species of culture by liberal bounty. The harder fruits, such as apples, crab-apples, pears, cherries, plums, grapes of the northern varieties, strawberries, raspberries, currants, blackberries, etc., yield abundant crops. The fruits of the intense heat of summer ripen early.

Among the wild animals most common are the gray and prairie wolf, bears, wild cats, raccoons, foxes, fowlers, woodchucks, deer, rabbits, and squirrels. The principal fur-bearing animals are the otter, mink, beaver, and muskrat. Feathered game is abundant, including ducks, wild geese, pigeons, grouse, partridges, and wild turkeys. The smaller birds are of numerous kinds, many of them distinguished for their gay plumage or the melody of their songs. The climate is less rigorous than might be expected from the high northern latitude. The winters are indeed long, but the air is dry and the temperature even, on which account the state is a common resort of invalids, especially of those with pulmonary complaints.

The number of miles of railroad in operation in the state at the close of 1878 was 2,608—all constructed within 17 years. The total earnings of the roads in 1878 were $7,431,199; amount of earnings over expenses, $3,903,571; passengers carried, 1,500,541; tons of freight, 2,887,516, and coal and wood those transported, 2,500,489. The total cost of the several lines built before 1875, including real estate and equipments, was $95,812,171.

As an agricultural state, Minnesota is not far from the front rank. The growth of wheat (mostly spring-sown) is immense, the yield per acre being larger than that of any other state e. of the Rocky mountains. The grain crops of 1873, stated in bushels, were as follows: Wheat, 2,402,485; oats, 12,544,593; corn, 6,457,386; barley, 669,415; rye, 96,877; buckwheat, 24,445—total, 46,290,136. Other crops in the same year were thus reported: Potatoes, 2,196,138; flax-seed, 100,853; tons of hay, 144,713; tons of wild hay, 763,619; lbs. of hops, 57,291; sorghum syrup, 33,230 gallons; lbs. of flax, 1,237,547; lbs. of tobacco, 38,324; number of apple trees in bearing, 3,852,093; bushels of apples, 20,367; lbs. of maple sugar, 139,953; lbs. of honey, 134,206; lbs. of wool, 529,857; lbs. of butter, 10,140,312; lbs. of cheese, 1,031,510. The locust plague inflicted great injury upon the growing crops for three successive seasons, beginning in 1874. The insects,
coming in vast swarms from the Rocky mountains and settling upon thriving fields, in a few hoursdevoured every vestige of vegetation. In 1874 the losses from this source were estimated as follows: Wheat, 2,669,892 bush. oats, 1,816,733 bush; corn, 738,415 bush. potatoes, 221,454 bush.; and other crops in relative proportion. In 1875, in 16 counties, the losses were: Wheat, 4,523,737 bush.; oats, 4,926,955 bush.; corn, 500,958 bush. In seven counties, in 1875, the bounties paid for the destruction of 58,336 bush. of these crops amounted to $78,505. The live stock in the state in 1875 were: Horses, 167,313; cattle, 467,079; mules, 35,572; sheep, 162,987; hogs, 4,817. The number of farms in the state in 1878 was 60,816, containing an aggregate area of 3,784,000 acres. The early sugar cane is extensively cultivated; the syrup produced in 1877 amounted to 149,150 gallons. The product of 1878 is not accurately reported, but it was much larger than that of 1877.

The water-power of Minnesota is so abundant and so thoroughly diffused as to afford in every part of the state all the manufacturing facilities that could be desired. In 1870 the number of manufacturing establishments was 2,072, with a capital of $11,806,785; producing goods valued at $23,396,997; persons employed, 9,726. The principal lines and their productions were as follows: Flour, 6,982,559; lumber, $5,083,157; sash, blinds, and doors, $1,162,482; carriages, wagons, etc., $553,780; machinery, locomotives, etc., $2,651,289; agricultural implements, $304,575; blacksmithing, $553,601; boots and shoes, $539,204; printing and publishing, $530,586. There has no doubt been a great increase in manufacturing industry in the last ten years, but accurate statistics are lacking. We know that in Minneapolis alone, in 1874, goods were manufactured of the value of $15,000,000. The flour manufactured in the state maintains the first rank. The assessed value of real estate in 1879 was $229,791,042; of personal property, $57,193,455.

The total receipts into the state treasury during the year ending Nov. 30, 1878, including a balance of $133,271 from the previous year, were $1,610,909; the sum disbursed was $1,562,410. The bonded debt of the state in 1875 amounted to $450,400.

The foreign commerce of Minnesota is carried on through the two ports of St. Paul and Dubuth, and by steamers to Manitoba on the Red river of the north. The number of arrivals under this head at St. Paul in 1874 was 23 steamboats and 6 barges, with an aggregate of 2,905 tons; imports valued at $15,340. At Dubuth, upper end of Lake Superior, during the same time, arrived 24 steamers and 47 sailing vessels, of an aggregate tonnage of 168,541 tons, valued at $6,096; cleared, 24 steamers and 4 sailing vessels, with an aggregate tonnage of 168,601 tons, and crews of 6,096 men. The foreign goods received were valued at $407,841, and the duties on them amounted to $183,118. The export to other states of lumber, wheat, flour, agricultural implements, etc., and the domestic importation of salt, coal, and merchandize keep the railroads busy.

There were in the state in 1874, 32 national banks, with a capital of $4,448,700, and a circulation of $445,000. There were at the same time 6 state banks, with resources amounting to $1,380,000. There were also seven savings banks, doing a prosperous business. "The Farmers' mutual fire insurance association at Minneapolis, in 1874, had assets amounting to $138,302. The St. Paul fire and marine insurance company had a capital of $40,000; assets, $728,632. There were also 62 insurance companies doing business in the state under charters derived from other states. One life insurance company, the Minnesota mutual, chartered by the state, and 92 others chartered elsewhere, were doing business in the state. The fire losses in 1874 and 1875 were: In 1874 was $416,056; in 1875, 609,777; in 1876, 780,806. The males in 1875 numbered 316,076; the females, 281,331; natives of this country, 379,973; foreigners, 217,429, of whom a large proportion were of Scandinavian origin. The first settlers of the state were chiefly from New England, and they went to the new state with a fixed determination to establish therein schools and colleges of a high order of excellence; accordingly much has been done to this end. In 1874 the children of school age (5 to 21 years) numbered 210,194, of whom 128,902—a larger proportion than in any other western state—were in school during some portion of the year. The number of school districts at that time was 3,296; number of school-houses, 2,758; valued at $8,293,700; number of schools, 2,789, in which the average attendance was 99,842; number of teachers, 5,482, of whom 1884 were males and 3,648 were females; total amount of teachers' wages, $678,600; average monthly wages of male teachers, $41.57; of female teachers, $30.52. The average annual length of the schools was nearly 7 months, and the whole amount expended for their support in 1874 was $1,155,542. The number of graded schools was 151, and there were high schools in many of the cities and larger towns, in which pupils were fitted to enter the university. The school fund amounted to $8,090,127; and it is expected that by the sale of lands devoted to the purpose it will be eventually augmented to $10,000,000. The state has 3 normal schools, one each at Winona, Mankato, and St. Cloud. The number of pupils in these schools fitting themselves for teachers in 1874 was 905, of whom 548—129 males and 422 females—had been regular in their attendance. Women enjoy the right to "vote at elections for school officers and in matters pertaining to the schools," and are "eligible to hold any office pertaining solely to their management." The University of Minnesota, organized at Minneapolis in 1857, embraces seven departments, viz.: college, civil, scientific, literary, and the arts, agriculture and the mechanic arts, medicine, and law. In all these courses it is intended to be as thorough as any institution of the kind.

7 Minnesota.
in the United States. It is endowed with both the university and agricultural college lands, which are expected ultimately to produce the sum of $1,000,000. There are in the state two other colleges, viz.: St. John's, near St. Joseph's, a Roman Catholic institution, and Carlton college (Congregational) at Northfield; also, many academies and seminaries, several of the latter especially for girls, and two or three business colleges. There are also three theological schools, the Augsburg evangelical seminary at Minneapolis, St. John's Roman Catholic seminary, and the Shabbona divinity school (Episcopal) at Faribault. The public institutions of the state are the reform school of St. Paul, the institution for the deaf, and dumb and the blind at Faribault, a soldiers' orphans' home at Winona, the hospital for the insane at St. Peter's, and the state prison at Stillwater. A second asylum for the insane will soon be completed. There is a private orphan asylum at St. Paul, and another at Shakopee.

In 1874 128 newspapers were published in the state, 15 of which were dailies. The number of libraries in the state in 1870 was 1413, containing 350,750 volumes. The whole number of church organizations in 1874 was 1247; church members, 880; church members, 116,703; ministers, 871. The principal denominations, in numerical order, were: Methodists, Roman Catholics, Lutherans, Baptists, Presbyterians, Episcopalians, Congregationalists, German Methodists, Universalists, and Christians.

The governor and other state officers are chosen by a plurality vote for a term of two years. The governor receives an annual salary of $3,000. The legislature, composed of a senate and house of representatives, the number of whose members is fixed from time to time by law, meets annually, the sessions being limited to 60 days. St. Paul is the capital. The election takes place on the Tuesday succeeding the first Monday in November. The supreme court consists of a chief justice and two associate justices, elected by the people for 7 years, and receiving a salary of $3,000. It has original jurisdiction in cases prescribed by law and appellate jurisdiction in matters of law and equity. In this court there are no jury trials. There are 11 judges of the district courts, each of whom is elected by the people of a district for a term of seven years. In Ramsey co., embracing the city of St. Paul, and Hennepin co., embracing the city of Minneapolis, there are courts of common pleas, whose judges have the same tenure of office as those of the district courts. Minnesota furnished to the army and navy during the war for the suppression of the rebellion, 27,000 men. The electoral votes of the state for president and vice-president of the United States have been cast as follows: 1840, 4 for Lincoln and Hamlin; 1864, 4 for Lincoln and Johnson; 1868, 4 for Grant and Colfax; 1872, 5 for Grant and Wilson; 1876, 5 for Hayes and Wheeler; 1880, 5 for Garfield and Arthur.

MINNESOTA, or St. Peter's RIVER, rises near the eastern boundary of Dakota terri- tory, United States, runs s.e. 300 m. to South bend, then n.e. 129 m., and falls into the Mississippi at Mendota. It is navigable for 40 m. by steamboats.

MINNESOTA, UNIVERSITY co., at Minneapolis, Minn., founded in 1858, under state charter consists of the collegiate department, with 5 courses of study; the college of science, literature, and the arts; the college of agriculture; and the college of mechanical's arts. Departments of law and medicine are to be organized. It is governed by a board of 10 regents, 7 of whom are appointed for 3 years by the governor; the governor, the president of the university, and the superintendent of public instruction are members or officers. Tuition is free to both sexes. There are 19 instructors, and the library contains about 10,000 vols. The present endowment is about $220,000, and will ultimately reach $1,000,000 by the sale of lands. The annual income is about $30,000.

The state geological and natural history surveys are in charge of the faculty.

MINNETAREES, or Hidatsa, a tribe of Indians, originally part of the Crow tribe, but for nearly a century associated with the Mandans, and settled on the upper Missouri river. Their number is not more than 450 or 500, having gradually decreased for many years. Treaties have been made with them by the government and a reservation in Montana set apart for them, but they prefer to remain where they are, gaining their living entirely by hunting and fishing. Though friendly to the whites, they have had many wars with the Sioux and other tribes. A dictionary and grammar of the language has been printed.

MINNOW, Leuciscus phoxinus, a small fish of the same genus with the roach, dace, chub, etc., of a more rounded form than most of its congeners, a common native of streams with gravelly bottoms in most parts of Britain. It seldom exceeds three inches in length, the head and back of a dusky olive color, the sides lighter and mottled, the belly white, or, in summer pink. Minnows, swimming in shoals, feed readily either on animal or vegetable substances, if sufficiently soft, and are said to be very destructive to the spawn of salmon and of trout. Very young anglers generally begin their sport by catching minnow. The minnow is a fish of very pleasant flavor. A casting-net affords the means of taking it in a sufficient abundance. It is a favorite bait for pike and large trout or perch.

MINO BIRD. See MIRA BIRD, ante.

MINOR, a term used in music. 1. In the nomenclature of intervals. The interval between any note and another is named according to the number of degrees between them.
MINOR is, in Scotch law, the term describing a person who, if a male, is between the ages of 14 and 21; and if a female, is between 12 and 21. In the preceding period he or she is called a pupil. In England the technical term is an infant (q.v.), which includes all persons, male and female, under the age of 21. In Scotland a minor is for many purposes sui juris, and can marry without anybody's consent, and can also make a will of movable property. For the purposes, however, of managing his real property and making contracts, curators are often necessary. See Infant, Restitution, Guardian.

MINOR BARONS. The word baron, in the earliest period of feudalism, signified one who held lands of a superior by military tenure. The superior might be the sovereign, or he might be an earl or other eminent person, who held of the sovereign. According as he was the one or the other, the baron was, in the earliest sense of the distinction, a greater or lesser baron. At the conquest a large part of the soil of England was parceled by William the Norman among his military retainers, who were bound in return to perform services, to do homage, and to assist in administering justice, and in transacting the other business done in the court of the king. 400 of these tenants-in-chief of the crown are enumerated in Domesday (q.v.), including among them "vice-comites" and "comites," who together constituted the body of men called the barons of England. As the sovereign was entitled to demand from the barons military service, homage, and attendance in the courts, so, many of the principal barons, particularly such of them as were earls, had military tenants, from whom they in turn received homage and assistance in administering justice in their baronial courts. These tenants were barons of the barons, or, in the earliest sense, minor barons; but by the usage of England, from the conquest downwards, they were seldom called barons, that term having been generally restricted to the former class, the holders of land direct from the crown, who were next to the king in dignity, formed his army and his legislative assembly, and obtained the great charter from king John. The subinfeudation which produced the minor barons was checked by a statute of Edward I., directing that all persons acquiring lands from a subject should hold, not of that subject, but of his superior.

Out of the "commune concilium" of the king, at which all his barons were bound to attend, arose the parliament. It is not till the close of Henry III.'s or beginning of Edward I.'s reign that we find a select number instead of the whole barons attending. The exact period of the change, and the way in which it was made, are still among the obscure points of English history; it has been thought that after the rebellion which was crushed at the battle of Evesham, Henry III. summoned only those barons who were most devoted to his interest. From that period a new distinction between the minor barons arose, the latter term being no longer applied to the barons of the barons, but to those barons of the crown who were no longer summoned by writ to parliament. The word baron was more and more used in the restricted sense of a baron of parliament, and the right or duty of attendance came in process of time to be founded, not on the tenure, but on the writ.

In Scotland the barons (or lairds) were such persons as held their lands directly of the crown. They were the king's advisers, witnessed his charters, and possessed a civil and criminal jurisdiction. All had to give attendance in the Scottish parliament, which consisted of the earls and barons sitting together. After the reign of James I. some of the more powerful barons appear more exclusively as lords of parliament, those whose incomes were below a certain amount obtaining a dispensation from attendance; yet all possessed a right to attend parliament till 1587, when the barons not specially created lords of his interest were required, in place of personally attending, to send representatives of their order from each sheriffdom. The term baron, however, still continued in Scotland to be applied to the whole body of tenants in capite, such of them as were lords of parliament being distinctively major, and the others minor barons; but all continuing up to 1747 to possess an extensive civil jurisdiction and a criminal jurisdiction, from which only treason and the four pleas of the crown were excluded. The representative minor barons sat in the same house with the major barons, and their votes continued down to the union to be recorded as those of the "small baronns."

MINORCA, the largest of the Balearic islands (q.v.) after Majorca, from which it is distant 25 m., n.e. It is 21 m. long and 13 m. in greatest breadth, with an area of about 300 sq. miles. Pop. 37,263. Its coast, broken into numerous bays and inlets, is fringed with islets and shoals, and its surface, less mountainous than that of Majorca, is undulating, rising to its highest point in mount Toro, 4,793 feet above sea-level. Its productions are similar to those of the larger island, although it is neither so fertile in soil nor so well watered as Majorca. The chief towns are port Mahon (q.v.), and Ciudadela. The annual exports are worth £110,000; the imports £100,000.
MINORITES, a name of the Franciscan order (q.v.), derived from the original later denomination adopted by their founder, Fratres Minoros. This name has left its trace in the popular designation of several localities both in English and foreign cities.

MINOS, the name of two mythological kings of Crete. The first is said to have been the son of Jupiter and Europa, the brother of Rhadamantus, the father of Deucalion and Ariadne, and, after his death, a judge in the infernal regions. The second of the same name was grandson of the former, and is said of Lycastus and Ida. To him the celebrated Labors of Minos are ascribed, in which he is said to have received instruction from Jupiter. He was the husband of that Pasiphae who gave birth to the Minotaur (q.v.). Homer and Hesiod know of only one Minos, the king of Cnossus, and son and friend of Jupiter.

MINOT, GEORGE, 1817-58; b. Mass.; read law in the office of Rufus Choate, and was admitted to the bar in 1839. He soon obtained a large practice in Boston. He reported the decisions of judge Levi Woodbury of the circuit court, and edited, in association with Richard Peters, jr., 8 vols. of the U. S. Statutes at Large, and was sole editor of that work from 1848 to 1858. He published in 1844 A Digest of the Decisions of the Supreme Court of Massachusetts, and, called, between 1853-54, the English Admiralty Reports in 9 vols.

MINOT, GEORGE RICHARDS, 1758-1802; b. Boston; educated at Harvard, and called to the bar. From 1781 to 1791 he was clerk of the Massachusetts house of representatives, and was secretary of the convention called to ratify the federal constitution. He continued the practice of his profession till 1792, when he was appointed judge of probate for Suffolk county. In 1796 he was made chief-justice of the court of common pleas, and served as such till his death. He was judge of the municipal court of Boston. He published a History of Shay's Rebellion, 1788, and a History of Massachusetts, 2 vols., 1798-1803. The latter work is in continuativa of Hutchinson's.

MINOTAUR (i.e., the bull of Minos), one of the most repulsive conceptions of Grecian mythology, is represented as the son of Pasiphae and a bull, for which she had conceived a passion. It was half-man half-bull, a man with a bull's head. Minos, the husband of Pasiphae, shut him up in the Cnossian labyrinth, and there fed him with youths and maidens, whom Athena was obliged to supply as an annual tribute, till Theseus, with the help of Ariadne, slew the monster. The Minotaur is, with some probability, regarded as a symbol of the Phenician sun-god.

MINOT'S LEDGE, a light-house on a ledge of Cohasset rocks from which a fixed light is exhibited and a fog bell is rung. It is 16 m. from Boston, and 8 m. s.e. of Boston light, on the s. coast, a position of great peril to incoming vessels. It is indispensable, as without it, from the nature of the entrance to the harbor, in a n.e. gale vessels would with certainty be driven on the rocks if they failed to make the entrance. It is 1/2 m. from land, and the rock on which it stands, 25 ft. in diameter, is visible only at low water, when the height is for a short time about 3/4 ft. above the water line. In 1847 congress made an appropriation for the construction of a light-house at this point, called the Outer Minot, surmounted by a dwelling placed at the height of 55 ft. above the highest rock. A skeleton iron light-house was designed and erected by capt. W. H. Swartz, at a cost of less than $10,000. It was formed of 8 heavy wrought iron piles, solid 10 in. skeleton shafts, with one additional in the center. The piles were each in 2 parts, connected by cast iron tubes 3 ft. long, the piles being secured to the tubes by large steel keys passing through the tubes and piles; and in its entire construction it was thought to be as secure as modern science could make it; but it stood only 2 years. On April 17, 1851, during one of the heaviest gales known on the coast, it was completely wrecked. A 1/2 in. hawser, anchored to a block of granite in the sea 50 fathoms from the base of the light, was attached at the other end to the top of the structure 63 ft. above the rock used ordinarily for raising boxes, etc. The keeper had carefully allowed some stores, that should have been below, to remain out on the scaffolding. This was supposed to be one cause of the disaster; and another was the quantity of ice that adhered to the piles. The money for the present structure was appropriated in 1852, and the plans were made in 1855, the success of the enterprise being due to the late chief engineer gen. J. G. Totten, his plans being executed by gen. Barron S. Alexander. It is of conical form 30 ft. at the base, built of granite, the height of the stone work being 88 ft., solid for 40 ft. from the base, the stones dovetailed, and bound together by galvanized wrought iron pins 3 in. in diameter. The portion above this solid work is divided into the apartments of the keeper, 5 stories, with 4 iron floors, his store rooms, and the light on the 6th floor. Two years were required to level the foundation rock, working from April 1 to Sept. 15, and then only when the tide served. The first stone was laid on July 9, 1857; 4 stones were placed in position during the season. In 1858 six courses were laid; the following year the structure reached a height of 60 ft.; and in 1860 it was completed at a cost of about $500,000, and the beacon was lighted.

MINSK, a capital in the Dietrich's, division of the grand-duchy of Russian Poles, and Jews, with a small percentage of Tartars and gypsies.

MINIS harness, or harness, one which is raised above the ground, is called a harness.Harness, 120 sq. ft., with a population (1870) of 1,182,230, composed chiefly of Russians, Lithuanians, Poles, and Jews, with a small percentage of Tartars and gypsies.
Five-sevenths of the population profess the Greek religion. The chief articles of export are timber, salt, and corn, which are brought by river-carriage to the Baltic and Black Sea ports. The principal manufactures are fine cloths, linen, and sugar. The soil is not fertile, and is covered to a large extent with woods and marshes, while in many other places it is a sandy waste; but in general the native products suffice for the wants of the inhabitants. The climate is very severe in winter. Cattle and sheep breeding are pursued with tolerable success. The inhabitants of the south or marshy portion of the province are subject to that dreadful disease, the plíca polonica (q.v.).

**MINSK**, the chief t. of the government of the same name, is situated on the Svisslocz, an affluent of the Berezina. It is mostly built of wood, but has many handsome stone edifices, among which are the Greek and Roman Catholic cathedrals and seminaries, the church of St. Catharine, a number of educational and philanthropic establishments, a public library, and a theater. The chief manufactures are woolen cloth and leather. Pop. '67, 36,277, many of whom are Jews.

**MINSTER.** See Monastery.

**MINSTREL.** A musician of the middle ages who was also a poet and singer; the term is applied to a class of persons who were to administer their skill in poetry and music for the amusement of their patrons. The various ways in which the word was written have perplexed the etymology. It appears, however, to have been no more than a consequent usage of the French ministré and the Latin ministri. They are in low Latin sometimes called plainly ministri; by Chaucer, in his *Dream,* "ministers," and in the old paper roll printed by Leland we find "ministers" who were appointed "to syng." The minstrels appear to have accompanied their songs with mimics and action, and to have practiced such various means of diverting as were most admired in those rude times, and supplied the want of more refined entertainment. These arts rendered them extremely popular and acceptable in England and all the neighboring countries, where no high scene of festivity was considered complete that was not set off with the exercise of their talents, and where, so long as the spirit of chivalry subsisted, they were protected and cared for, because their songs tended to honor the ruling passion of the times, and to encourage a martial spirit. The minstrels seem to have been the genuine successors of the ancient bards, who, under different names, were admired and revered, from the earliest ages, among the people of Gaul, Britain, and, indeed, through almost all Europe, whether Celtic or Gothic; but by none more than by the early Germans, particularly by the Danish tribes. Among these they were distinguished by the name of scalds, a word which denotes "smoothers and polishers of language." Their skill was considered as something divine, their persons were deemed sacred, their attendance was solicited by kings, and they were everywhere loaded with honors and rewards. When the Saxons were converted to Christianity this rude admiration began to subside, and poets were no longer considered a peculiar class or profession. The poet and the minstrel became two persons. Poetry was cultivated by men of letters indiscriminately, and many of the most popular rhymes were composed amidst the leisure and retirement of monasteries. But the minstrels continued to be a distinct order of men, and obtained their livelihood by means of their music. Their bards were hospitably received, and retained many of the honors conferred upon the bards and the troubadours. Although some of them only recited the compositions of others, many of them still composed songs, and all of them could probably invent a few stanzas upon occasion. Some of the longer metrical romances were written by monks, but the shorter narratives were probably composed by the minstrels who sung them, and there is no doubt that most of the old heroic ballads were produced by this order of men. From the striking variations which occur in different copies of these old pieces it is evident that they made no scruple to alter one another's productions; and the reciter added or omitted whole stanzas, according to his own fancy or convenience. In England the profession of minstrel was a popular and privileged one from the time of the conquest, but this entertaining class never met with so much royal patronage as during the reign of Richard I. This brilliant crusader, himself an adept in the minstrel's art, invited to his court many of the minstrels and troubadours from France, and loaded them with honors and rewards such as arms, clothes, horses, and money. But the whole order of the minstrel, Blondell de Nesle, discovering his royal master by singing a French chanson under the walls of a German castle in which he was a prisoner, has never been authenticated, but it presents a popular illustration of the traditional devotion of the royal minstrel to his art. The instances of regard shown to minstrels during subsequent reigns are abundant. Edward II, rewarded his minstrel William de Morle, known as "Roi de North," with certain houses which had previously belonged to the degraded minstrel John de Boteler, called "Roi Brumard." We also find from Rymer that in 1415, when Henry V. was on his voyage to France, he was accompanied by eighteen minstrels, who were to receive twelve pence a day. Indeed, the minstrels were often in those days more amply paid than the clergy. From the time of Edward IV., however, the real character of the original minstrels was gradually lost; and they were seldom called upon to find a specimen of their venerable art except when some great personage conceived on a public occasion to patronize the rude pastimes of his ancestors. The genuine minstrel was seldom to be found in England, and the name had become so far
degraded as popularly to denote a mere musician. It is true that at the magnificent entertainment of queen Elizabeth by Leicester, at Kenilworth castle, in 1575, a person was introduced to amuse the queen, in the attitude of an ancient minstrel, who called himself, "a squire minstrel of Middlesex," but this was no doubt a part of the masquerade. Before Elizabeth closed her reign the degradation of minstrelsy was completed. In her reign it was common to see minstrels together with jugglers, bear-walks, fencers, common players of interludes, tinkers, and peddlers, were included among rogues, vagabonds, and sturdy beggars, and were adjudged to be punished as such.

**MINT, Mentha, a genus of plants, of the natural order labiatae; with small, funnel-shaped, 4-tid, generally red corolla, and four straight stamens. The species are perennial herbaceous plants, varying considerably in appearance, but all with creeping rootstocks. The flowers are herbed, the whorls often irregular in shape or heads. The species are widely distributed over the world. Some of them are very common in Britain, as WATER MINT (M. aquatica), which grow in wet grounds and ditches, and CORN MINT (M. arvensis), which abounds as a weed in cornfields and gardens. These and most of the other species have erect stems. All the species contain an aromatic essential oil, in virtue of which they are more or less medicinal. The most important species are SPEARMINT, Peppermint, and PENNY-ROYAL.—SPEARMINT or Green Mint (M. viridis), is a native of almost all the temperate parts of the globe: It has erect smooth stems, from 1 ft. to 2 ft. high, with the whorls of flowers in loose cylindrical or oblong spikes at the top; the leaves lanceolate, acute, smooth, serrated, destitute of stalk, or nearly so. It has a very agreeable odor.—Peppermint (M. piperita), a plant of equally wide distribution in the temperate parts of the world, is very similar to spearmint, but has the leaves stalked, and the flowers in short spikes, the lower whorls some with bicolored flowers. It is a native of the temperate parts of the world, and is much esteemed for its odor and of its taste.—Penny-royal (M. pulegium), also very cosmopolitan, has a much-branched prostrate stem, which sends down new roots as it extends in length; the leaves ovate, stalked, the flowers in distant globoso whorls. Its small resemblance that of the other mints.—All these species, in a wild state, grow in ditches or wet places. All of them are cultivated in gardens; and peppermint largely for medicinal use and for flavoring lozenges. **Mint sauce** is generally made of spearmint; which is also used for flavoring soups, etc. A kind of mint with lemon-scented leaves, called BERNAMONT MINT (M. citrata), is found in some parts of Europe, and is cultivated in gardens. Varieties of peppermint and horse-mint (M. sylvestris), with crispeld or indato-ragose leaves, are much cultivated in Germany under the name of CURLED MINT (Kratze-mintz); the leaves being dried and used as a domestic medicine, and in poultices and baths. All kinds of mint are easily propagated by parting the roots or by cuttings. It is said that mice have a great aversion to mint, and that a few leaves of it will keep them at a distance. Peppermint, penny-royal, and spearmint are used in medicine. The pharmacopoeias contain an aper, spiritus, and oleum of each of them; the official part being the herb, which should be collected when in flower. Peppermint is a powerful diffusible stimulant, and, as such, is antispasmodic and stomachic, and is much employed in the treatment of gastralgia and flatulent colic. It is also extensively used in mixtures, for covering the taste of drugs. Penny-royal and spearmint are similar in their action, but inferior for all purposes to peppermint. The ordinary doses are from 1 to 2 ounces of the aper, a dram of the spiritus (in a wine-glassful of water), and from 3 to 5 drops of the oleum (on a lump of sugar).

**MINT** (Lat. moneta), an establishment for making coins or metallic mony (see Money). The early history of the art being traced under the head NUMISMATICS, the present article is mostly confined to a sketch of the constitution of the British mint, and of the modern processes of coining as there followed.

The earliest regulations regarding the English mint belong to Anglo-Saxon times. An officer called a wrecw is referred to in the laws of Canute as having some jurisdiction over it, and certain names which, in addition to that of the sovereign, appear on the Anglo-Saxon coins, seem to have been those of the moneyers, or principal officers of the mint, till recently, an important class of functionaries, who were responsible for the integrity of the coin. Besides the sovereign, barons, bishops, and the greater monasteries had their respective mints, where they exercised the right of coinage, a privilege enjoyed by the bishop of Canterbury, as late as the time of Edward II., and by Walsall as bishop of Durham and archbishop of York.

After the Norman conquest, the officers of the royal mint became to a certain extent subject to the authority of the exchequer. Both in Saxon and Norman times, there existed, under control of the principal mint in London, a number of provincial mints in different towns of England; there were no fewer than 38 in the time of Ethelred, and the last of them were only done away with in the reign of William III. The officers of the mint were formed into a corporation by a charter of Edward II.; they consisted of the warden, master, comptroller, assay-master, workers,coiners, and subordinate.

The seignorage for coining at one time formed no inconsiderable item in the revenues of the crown. It was a deduction made from the bullion coined, and comprehended both a charge for delaying the expense of coinage, and the sovereign's profit in virtue of his prerogative. In the reign of Henry VI., the seignorage amounted to 6d. in
the pound: in the reign of Edward I., 1s. 2½d. By 18 Car. II. c. 5, the seignorage on gold was abolished, and has never since been exacted. The shire, or remedy, as it is now called, was an allowance for the unavoidable imperfection of the coin.

The function of the mint is in theory to receive gold in ingots from individuals and return an equal weight in sovereigns; but, in point of fact, gold is now exclusively coined for the bank of England, for, though any one has still the right to coin gold at the mint, the merchant or dealer has ceased to obtain any profit for so doing, as the bank is compelled to purchase all gold tendered to it at the fixed price of £3 17s. 6d. an ounce. The increment on the assay (q.v.), or on the fineness of the metal, which augments the standard weight, and therefore the value of the gold, is a more considerable source of profit to the importer of the gold. The ordinary trade assay, on which the importer purchases the bullion, does not, by usage, come closer than ¾ of a carat grain, or ¾ grains per lb. troy. Before being coined the gold is subjected to a second and more delicate assay at the mint, and the importer receives the benefit of the difference, amounting to about ¼ of a carat grain = 5½ troy grains, or nearly 8d. per lb. weight.

Silver, which was formerly, concurrently with gold, a legal tender to any amount, has, by 56 George III. c. 68, ceased to be so. There is a seignorage on both silver and copper money, amounting in silver to 10 per cent, when the price of silver is 5s. per ounce, which, however, from the wear and tear of the coin, brings small profit to the crown. On the copper coinage the seignorage is no less than 100 per cent on the average price of copper. The profits of the seignorage, formerly retained by the master of the mint to defray the expense of coining, have, since 1837, been paid into the bank to the credit of the consolidated fund.

A new mint was erected on Towerhill in 1810. In 1815 some alterations were made in its constitution; and in 1851 a complete change was introduced in the whole system of administration. The control of the mint was vested in a master and a deputy master, and comptroller. The mastership, which had in the early part of the present century become a political appointment held by an adherent of the government, was restored to the position of a permanent office, the master being the ostensible executive head of the establishment. The operative department was intrusted to the assayer, the molder, and the refiner. The moneymen, who had from early times enjoyed extensive privileges and exemptions, and were contractors with the crown for the execution of the coining, were abolished, and the contracts with the crown were entered into by the master of the mint, who has made subordinate contracts for the actual manufacture of the coin. Further changes were made on the administration of the mint in 1869. The mastership was added to the duties of the chancellor of the exchequer, without any addition of salary, and the offices of deputy master and comptroller were amalgamated. A yearly saving of £10,000 is believed to have been effected by the changes of 1851, and a further £5,000 by those of 1869, with an increase of efficiency. It is at present in contemplation to remove the mint from Towerhill to the rear of the Thames embankment at Whitefriars, with new and improved machinery. Mints have lately been established at Sydney and Melbourne to coin the gold so largely found in Australia.

Processes of Coining.—Down to the middle of the 16th c. little or no improvement seems to have been made in the art of coining from the time of its invention. The metal was simply hammered into slips, which were afterwards cut up into squares of one size, and then forged round. The required impression was given to these by placing the dies on the surfaces, and then driving them in with a hammer. This method was continued for two centuries, and it is evident that this method to place the dies exactly above each other, or to apply proper force, coins so made were always faulty, and had the edges unfinished, which rendered them liable to be clipped. The first great step was the application of the screw, invented in 1553 by a French engraver of the name of Brucker. The plan was found expensive at first, and it was not till 1662 that it altogether superseded the hammer in the English mint. The chief steps in coining as now practiced are as follows: The gold or silver to be coined is sent to the mint in the form of ingots (Ger. eingessenen, Du. eingedaan, to pour in, to cast), or castings; those of gold weighing each about 180 oz., while the silver ingots are much larger. Before melting, each ingot is tested as to its purity by assaying (q.v.), and then weighed, and the results carefully recorded. For melting the gold, pots or crucibles of plumbago are used, made to contain each about 1200 oz. The pots being heated white in furnaces, the charge of gold is introduced along with the proper amount of copper (depending upon the state of purity of the gold as ascertained by the assay), to bring it to the standard, which is 22 parts of pure gold to 2 of copper (see Alloy). The metal when melted is poured into iron molds, which form it into bars 21 in. long, 1½ in. broad, and 1 in. thick, if for sovereigns, and somewhat narrower if for half-sovereigns. For melting silver (the alloy of which is adjusted to the standard of 222 parts of silver to 18 of copper), malleable iron pots are used, and the metal is cast into bars similar to those of gold.

The new copper, or rather bronze coinage, issued in 1800, is an alloy consisting of 95 parts of copper, 4 of tin, and 1 of zinc. The coins are only about half the weight of their old copper representatives. The processes of casting and coining the bronze are essentially the same as in the case of gold and silver.

The operation of rolling follows that of casting. It consists in repeatedly passing the bars between pairs of rollers with hardened steel surfaces, driven by steam-power; the
rollers being brought closer and closer as the thickness becomes reduced. At a certain stage, as the bars become longer, they are cut into several lengths; and to remove the hardness induced by the pressure they are annealed. The finishing rollers are so exquisitely adjusted that the fillets (as the thinned bars are called) do not vary in thickness in any part more than the ten-thousandth part of an inch. The slips are still further reduced in the British mint at what is called the "draw bench," where they are drawn between steel dies, as in wire-drawing, and are then exactly of the necessary thickness for the coin intended.

The fillets thus prepared are passed to the tryer, who, with a hand-punch, cuts a trial-blank from each, and weighs it in a balance; and if it vary more than 4th of a grain, the whole fillet is rejected.

For cutting out the blanks of which the coins are to be made, there are in the British mint 12 presses arranged in a circle, so that one wheel with driving cams, placed in the center, works the whole. The punches descend by pneumatic pressure, and the fillets are fed into the presses by boys, each punch cutting out about 60 blanks a minute. The scrap left after the blanks are cut out, called "scissel," is sent back to be remelted.

Each blank is afterwards weighed by the automatic balance—a beautiful and most accurate instrument, which was added to the mint about 20 years ago. It weighs 23 blanks per minute, and each to the .001 of a grain. The standard weight of a sovereign is 123.274 grains, but the mint can issue them above or below this to the extent of 0.2568 of a grain, which is called the "remedy." Blanks which come within this limit are dropped by the machine into a "medium" box, and pass on to be coined. Those below the required weight are pushed into another box to be remelted, those above it into another, and are reduced by filing. The correct blanks are afterwards rung on a sounding iron, and those which do not give a clear sound are rejected as dumb.

To insure their being properly milled on the edge, the blanks are pressed edgeways in a machine between two circular steel-plates, which raises the edges, and at the same time secures their being perfectly round. After this they are annealed to soften them, before they can be struck with dies; they are also put into a boiling pot of dilute sulphuric acid, to remove any oxide of copper from the surface. Subsequently they are washed with water, and dried with great care in hot sawdust, and finally in an oven at a temperature slightly above boiling water. Without these precautions, the beautiful bloom upon new coin could not be secured.

We now come to the press room, where the blanks receive the impression which makes them perfect coins. The coining press is shown in the fig., and there are eight of them in all, ranged in a row upon a strong foundation of masonry. CCB is the massive iron frame into which the screw D works, the upper part B being perforated to receive it. On the bottom of this screw the upper steel die is fixed by a box, the lower die being fixed in another box attached to the base of the press. The dies are shown in fig. The blank coin is placed on the lower die, and receives the impression when the screw is turned round so as to press the two dies forcibly towards each other. A steel ring or collar contains the coin while it is being stamped, which preserves its circular form, and also effects the milling on the edge. In cases where letters are put on the edge of
a coin, a collar divided into segments working in center-pins, is used. On the proper pressure being applied, the segments close round, and impress the letters on the edge of the coin.

The screw of the press is put in motion by means of the piece A, which is worked by machinery driven by steam-power, and situated in an apartment above the coin-room. The steam-engine exhausts an air-chamber, and from the vacuum produced, an air-engine works a series of air-pumps, which communicate a more exact and regular motion to the machinery of the stamping presses than by the ordinary condensing engine. The loaded arms HR strike against blocks of wood, whereby they are prevented from moving too far, and run the risk of breaking the hard steel dies by bringing them in contact. The press brings down the die on the coin with a twisting motion, but if it were to rise up in the same way, it would abrade the coin; there is, in consequence, an arrangement which, by means of a wide notch in the ring 3, allows the die to be raised up a certain distance before it begins to turn round with the screw.

On the left side of the figure, the arrangement for feeding the blanks and removing the coins as they are stamped, is shown. A lever H1K, moving on a fulcrum L, is supported by a bar Q, fixed to the side of the press. The top of this lever is guided by a sector, 7, fixed upon the screw D. In this sector there is a spiral groove, which, as the screw turns round, moves the end H of the lever to or from the screw, the other end K being moved at the same time either towards or away from the center of the press. The lower end of the lever moves a slider L, which is directed exactly to the center of the press, and on a level with the upper surface of the die. The slider is a thin steel-plate in two pieces united by a joint, and having a circular cavity at the end, which, when its limbs are shut, grasps a piece of coin by the edge. This piece drops out on the limbs separating. There is a tube at K which an attendant keeps filled with blank pieces; it is open at the bottom, so that the pieces rest on the slider. When the press is screwed down, the slider is drawn back to its furthest extent and its circular end comes exactly beneath the tube. A blank piece of coin now drops in, and is carried, when the screw rises, to the collar which fits over the lower die. The slider then returns for another blank, while the upper die descends to give the impression to the coin. Each time the slider brings a new blank to the die, it at the same time pushes off the piece last struck. An arrangement of springs lifts the milled collar to inclose the coin while it is being struck.

It is found on examining the coins that about 1 in 200 is imperfectly finished; these being rejected, the rest are finally weighed into bags, and subjected to the process of weighing. This consists in taking from each bag a certain number of sovereigns or other coins, and subjecting them to a final examination by weight and assay, before they are delivered to the public.

MINT (ante). The first U. S. mint was established at Philadelphia by the coinage act of April 2, 1792; and the first production of the new mint was the copper cent of 1793. Silver dollars were first coined in 1794 and gold eagles in 1795. Branches of the Philadelphia mint were organized at New Orleans, Dahlonega, Ga., and Charlotte, N. C., in 1835; at San Francisco, Cal., in 1854, and at Carson City, Nev., in 1857. Those at New Orleans, Dahlonega, and Charlotte have been given up. Assay offices were set up at New York in 1854, at Denver in 1864, and Boise City, Idaho, in 1872. The act of April 3, 1878, put all the mints and assay offices on the same footing as a bureau of the treasury department, under the superintendence of the director of the mint, who is appointed by the president for a term of 5 years, and is under the supervision of the secretary of the treasury. The director of the Philadelphia mint, who had hitherto been called director of the mint, was now known as superintendant of the Philadelphia mint. Every mint has a superintendant, melter and refiner, assayer, and coiner, and the Philadelphia mint has an engraver, who supervises the manufacture of the dies used in all the U. S. mints. The total production of the mints for 1880 was: gold coin, $56,157,785.00; silver, $27,942,497.50; minor coins, $369,971.50. The present director of the mint (1881) is Horatio C. Burchard, of Illinois.

MINTO, GILBERT ELLIOT, Earl of, 1751-1814; entered the British parliament as a whig in 1774. He was minister to Denmark from 1788 to 1794, then went to Corsica as viceroy. On his return in 1797 he was created baron Minto, and two years later he became ambassador to Vienna. On his reappearance in the house of lords he became an advocate of the union of Ireland with England, and afterwards strenuously opposed Roman Catholic emancipation. He was governor-general of Bengal from 1807 to 1813, and in the latter year received the titles of earl Minto, viscount Melgund.

MINTURN, ROBERT BOWNE, 1805-68; b. N. Y.; entered mercantile life at an early age in New York city, and became eventually a partner in the well known shipping house of Grinnell, Minturn & Co., in which he accumulated a large fortune. He was chiefly noted as an active promoter of the city's charities; as one of the founders of St. Luke's hospital; for patriotic service during a visit to Europe in 1861; and as an earnest worker in behalf of the freedmen. At the time of his death he was president of the Union League club of New York.
MINUCIUS, Felix Marcus, an eminent apologist of the Latin church in the 3d century. He was a native of Africa, but removed to Rome, where he was a successful advocate until his conversion to Christianity. Jerome and Lactantius speak of him as much admired for his eloquence. He wrote a work entitled Octavies in the form of a dialogue between a Christian called Octavius and a heathen called Celsinus. Octavius defends the Christians from the calumnies which were circulated against them, and exposes them with crimes in their secret religious meetings. He, on the other hand, exposes the licentious practices of the heathen. The style of the work is argumentative and pure, and much information is given concerning the manners, customs, and opinions of that period. As an apology for Christianity his work compares favorably with those of Justin, Tertullian, and other early advocates of the Christian faith, and with those of Lactantius, Ambrose, and Eusebius of the 4th century. It was at one time ascribed to Arnobius as a part of his treatise Adversus Gentes; but Baldwin in a Dissertation on Minucius, shows that Minucius was the author. It has passed through many editions at Leyden and Cambridge, Eng., the latter containing numerous notes by Dr. Davis, and a dissertation or commentary by Baldwin. It has been translated also into French and German.

MINUET, the air of a most graceful dance, originally from Poitou, in France. It is performed in a slow tempo. The first minuet is said to have been composed by Lully the elder, and was danced by Louis XIV, in 1653 at Versailles with his mistress. The music of the minuet is in 3 time, and is still well known in England by the celebrated minuet de la cour, which is frequently introduced in stage performances.

MINUIT, MINUITS, or MINNEWIT. Peter, 1580-1641; b. Germany; a deacon in the Protestant or Walloon church in Wesel, who removed to Holland early in the 17th c., and after a residence there of some years received from the Dutch West India company the appointment of governor and director-general of New Netherland. He reached the seat of his government, Manhattan island, May 4, 1626, and proceeded to establish in permanency his tenure and that of the company by purchasing the island from the Indians, obtaining it for the sum of sixty ejillers, about 24 dollars. He built fort Amsterdam, and defended the claim of the Dutch to rightful possession of the island with great courage and determination, while he administered the affairs of his office judiciously and to the general satisfaction of the colony, which advanced in power and prosperity. The fact that the patroons were successful in establishing titles to enormous tracts of land became objectionable to the Dutch West India company, who recognized the introduction of abuses in this course and placed the responsibility on the shoulders of gov. Minuit. In 1631 he was accordingly recalled by the company, and sailed for Holland in the following spring, but was driven into Plymouth, Eng., by a gale. Here a charge was set up against him of having prosecuted illegal trading within English dominions, and his vessel was attached on complaint made by the New England council. It requested a protest from the ambassador of Holland in London to obtain the release of the vessel, and the discharge of the complaint; and this was not effected until the latter part of May. Minuit now made every effort to re-establish himself in the favor of the Dutch West India company, but without success, and at length offered his services to the government of Sweden for colonizing purposes. His proposition was favorably consid-
ered by the government of Sweden and Octavianus, who was then chancellor, and through his influence a Swedish West India company was organized, and Minuit was commissioned by the queen to establish a Swedish colony in America. He accordingly gathered together sufficient Swedes and Finns for this purpose, and sailed for the port of Gothenburg, Sweden, in 1637, bound for the w. coast of Delaware bay, which point had been selected for the site of the new colony. He arrived in Chesapeake bay in the spring of 1638, and built fort Christians, near where the city of Wilmington, Del., now stands. The Swedish colonization scheme was bitterly opposed by the Dutch, who threw every possible obstacle in the way of its success, and eventually captured the colony and annexed it to their possessions in 1655. But while it was under the direction of Minuit, during which time it was called New Sweden, the Dutch were unable to accomplish its absorption. Minuit died at fort Christians.

MINUTE, a rough draft of any proceeding or instrument; so called from being taken down shortly and in minute or small writing, to be afterwards engrossed. See Exensor.

--MINUTE, in law, is a memorandum or record of some act of a court or of parties; in the latter sense, it is used chiefly in Scotland, as in the case of minute of agreement, minute of sale, etc.

MINUTE, the 60th part of an hour; also the 60th part of a degree of a circle. See Sexagesimal Arithmetic.—MINUTE, in architecture, is the 60th part of the diameter of the shaft of a classic column, measured at the base. It is used as a measure to determine the proportions of the order.

MIocene (Gr. less recent), a term introduced by Lyell to characterize the middle tertiary strata, which he supposes to contain a smaller proportion of recent species of mollusca than the newer piocene, and more than the older eocene. He estimates the proportion of living to fossil species in the miocene at 25 per cent.

Strata of this age occur in Britain in two limited and far separated localities—in the
island of Mull, and at Dartmoor in the s.e. of England. In this last district, they exist at Bovey Tracey, in a flat area of 10 m. long by 2 m. broad, and consist of clay interstratified with beds of imperfect limestones. Pengelly and Heer have recently examined the strata of this small basin, and have found that all the plants are of miocene age, and belong to the same species as those found in similar deposits, not only on the continent, but in Iceland, Greenland, and Arctic America. Their fossils indicate a warmer climate than the present, and the geographical range of the species is unexampled in the existing flora. The Mull beds are situated at the headland of Ardnamurchan, and consist of interstratified basalts, ashes, and limestones. There are three leaf-beds, varying in thickness from 13 to 21 ft., separated by two beds of ash, the whole resting on and covered by strata of basalt.

The whole thickness is 181 feet. It is supposed that the leaf-beds were deposited in a shallow lake or marsh, in the vicinity of an active volcano. One of the beds consists of a mass of compressed leaves without stems, and accompanied with abundant remains of an equisetium, which grew in the marsh into which the leaves were blown. The leaves belong to dicotyledons and coniferæ, and are of species similar to those of Bovey Tracey.

The Fjälluns of France are of this age, as are also part of the Molüsli of Switzerland, and the Mayence and Vienna basins. Of the same period are the highly fossiliferous deposits in the Sewaulik hills, India, containing the remains of several elephants, a mammoth, hippopotamus, giraffe, and large oriches, besides several carnivora, monkeys, and crocodiles, and a large tortoise, whose shell measured 30 ft. across. The European beds contain the remains of the dinothorax (q.v.).

MIOHIPPUS. See Horse, Fossil.

MIÖSEN, a lake in Norway, 36 m. n.e. of the city of Christiania, from which it may be reached by railroad. It is formed by the Loughen river, which empties into the lake at the little village of Lillehammer, and is 56 m. long and 12 m. in its greatest width. The scenery is very picturesque, and, as the climate of that part of Norway is most invigorating, the vicinity of the lake is very popular as a summer resort.

MIRABEAU, Honoré Gabriel Riquetti, Comte de, was b. Mar. 9, 1749, at Bignon, near Nemours. He was descended, by his own account, from the ancient Florentine family of Arrighetti, who, being expelled from their native city in 1208, on account of Ghibelline politics, settled in Provence. Jean de Riquetti or Arrighetti purchased the estate of Mirabeau in 1562; his grandson, Thomas, happened to entertain here, in 1699, Louis XIV. and cardinal Mazarin, on which occasion he received from the monarch the title of marquis Victor Riquetti. Marquis de Mirabeau (b. 1715, d. 1799), the father of Honoré, was a writer of instruction and wrote his patrimony, wrote books of philanthropy and philosophy, as L'Ami des Hommes (5 vols. Par. 1755), and was a cruel tyrant in his own house. He procured no fewer than 54 lettres de cachet at different times against his wife and his children. Honoré, his eldest son, was endowed with an athletic frame and extraordinary mental abilities, but was of a fiery temper, and disposed to every kind of excess. He became a lieuut., in a cavalry regiment; but continued to prosecute various branches of study with great eagerness, whilst outrunning his companions in a career of vice. An intrigue with the youthful wife of an aged marquis brought him into danger, and he fled with her to Switzerland, and thence to Holland, where he subsisted by his pen, amongst other productions of which his Essai sur le Despotisme attracted great attention. Meanwhile, sentence of death was pronounced against him; and the French minister, at his father's instigation, demanding that he should be delivered up to justice, he and his paramour were apprehended at Amsterdam, and he was brought to the dungeon at Vincennes, and there closely imprisoned for 42 months. During this time he was often in great want, but employed himself in literary labors, writing an Essai sur les Lettres de Cachet et les Prisons d'état, which was published at Hamburg (2 vols. 1782), and a number of obscene tales, by which he disgraced his genius, although their sale supplied his necessities. After his liberation from prison, he subsisted chiefly by literary labor, and still led a very profligate life. He wrote many effective political pamphlets, particularly against the financial administration of Calonne, receiving pecuniary assistance, it was said, from some of the great bankers of Paris; and became one of the leaders of the liberal party. When the states-general were convened, he sought to be elected as a representative of the nobles of Provence, but was rejected by them on the ground of his want of property; and left them with the threat that, like Marius, he would overthrow the aristocracy. He purchased a draper's shop, offered himself as a candidate to the third estate, and was enthusiastically returned both at Aix and Marseilles. He chose to represent Marseilles, and by his talents and admirable oratorical powers soon acquired great influence in the states-general and national assembly. Barnave well characterized him as "the Shakespeare of eloquence." He stood forth as the opponent of the court and of the aristocracy, but regarded the country as by no means ripe for the extreme changes proposed by political theorists, and labored, not for the overthrow of the monarchy, but for the abolition of despotism, and the establishment of a constitutional throne. To suppress insurrection he effected, on July 8, 1789, the institution of the national guard. In some of the contests which followed, he sacrificed his popularity to maintain the throne. The more that anarchy and revolutionary frenzy prevailed, the more decided did he become in his resistance to their prog-

U. K. X.—2
ress; but it was not easy to maintain the cause of constitutional liberty at once against the supporters of the ancient despotism and the extreme revolutionists. The king and his friends were long unwilling to enter into any relations with one so disreputable, but at last, under the pressure of necessity, it was resolved that Mirabeau should be invited to become minister. No sooner was this known than a combination of the most opposite parties, by a decree of Nov. 7, 1789, forbade the appointment of a deputy as minister. From this time forth Mirabeau strove in vain in favor of the most indispensable prerogatives of the crown, and in so doing exposed himself to popular indignation. He still continued the struggle, however, with wonderful ability, and sought to reconcile the court and the revolution. In Dec., 1790, he was elected president of the club of the Jacobins, and in Feb., 1791, of the national assembly. Both in the club and in the assembly he displayed great boldness and energy; but soon after his appointment as president on the latter he manifested symptoms of both bodily and mental weakness, consequent upon his great exertions and his continued debaucheries, and died April 2, 1791. He was interred with great pomp in the church of St. Genevieve, the "Pantheon," but his body was afterwards removed to make room for that of Marat. A complete edition of his works was published at Paris in 9 vols. in 1825-27. His natural son, Lucas Montigny, published Mémoires Biographiques, Littéraires et Politiques de Mirabeau (2d edit. 8 vols. Par. 1841), the most complete account which we have of his life. See also Carlyle's sketch of Mirabeau in his Miscellaneous Essays and his French Revolution.

**Miracle.** A term commonly applied to certain marvelous works (healing the sick, raising the dead, changing of water into wine, etc.), ascribed in the Bible to some of the ancient prophets, and to Jesus Christ, and one or two of his followers. It signifies simply that which is wonderful—a thing or a deed to be wondered at, being derived directly from the Latin miraculum, a thing marvelous—an object of wonder, a surprising thing. This is the governing idea of the term applied in the New Testament to the Christian miracles, &c., a marvel, a portent; besides which, we also find them designated diuinaeis, powers, with a reference to the power residing in the miracle-worker; and ωσιν, signs, with a reference to the character or pretensions of which they were assumed to be the witnesses or guarantees. Under these different names, the one fact recognized is a deed done by a man, and acknowledged by the common judgment of men to exceed man's ordinary powers: in other words, a deed supernatural, above or beyond the common powers of nature, as these are understood by men.

In the older speculations on the subject, a miracle was generally defined to be a violation or suspension of the order of nature. While, on the one hand, it was argued (as by Hume) that such a violation or suspension was absolutely impossible and incredible; it was maintained, on the other, that the Almighty, either by his own immediate agency, or by the agency of others, could interfere with the operation of the laws of nature, in order to secure certain ends, which, without that interference, could not have been secured, and that there was nothing incredible in the idea of a law being suspended by the person by whom it had been made. The laws of nature and the will or providence of God were, in this view, thus placed in a certain aspect of opposition to each other, at points here and there clashing, and the stronger arbitrarily asserting its superiority. Such a view has, with the advance of philosophical opinion, appeared to many to be inadequate as a theory, and to give an unworthy conception of the divine character. The great principle of law, as the highest conception not only of nature but of divine Providence, in all its manifestations, has asserted itself more dominantly in the realm of thought, and led to the rejection of the apparently conflicting idea of "interference" implied in the old notion of miracle. Order in nature, and a just and uncapricious will in God, were felt to be first and absolutely necessary principles. The idea of miracle, accordingly, which seems to be now most readily accepted by the advocates of the Christian religion, has its root in this recognized necessity.

All law is regarded as the expression, not of a lifeless force, but of a perfectly wise and benevolent will. All law must develop itself through natural phenomena; but it is not identified with or bound down to any necessary series of these. If we admit the main-spring of the universe to be a living will, then we may admit that the phenomena through which that will, acting in the form of law, expresses itself, may vary without the will varying or the law being broken. We know absolutely nothing of the mode of operation in any recorded miracle; we only see certain results. To affirm that these results, are either impossible in themselves, or necessarily violations of natural law, is to pronounce a judgment on imperfect data. We can only say that, under an impulse which we must believe proceeds from the divine will, in which all law exists, the phenomena which we have been accustomed to expect have not followed on their ordinary conditions. But from our point of view we cannot affirm that the question as to how this happens is one of interference or violation; it is rather, probably, one of higher and lower action. The miracle may be but the expression of one divine order and benefit, which is a new shape of the law of a greater freedom, to use the words of Trench, swallowing up the law of a lesser.

Nature being but the plastic medium through which God's will is ever manifested to us, and the design of that will being, as it necessarily must be, the good of his creatures, that theory of miracle is certainly most rational which does not represent the ideas of
laws, and of the will of God as separate and opposing forces, but which represents the
divine will as working out its highest moral ends, not against, but through law and order,
and evolving from these a new issue, when it has a special beneficent purpose to serve.
And thus, too, we are enabled to see in miracle not only a wonder and a power, but a sign
—a revelation of divine character, never arbitrary, always generous and loving, the char-
acter of one who seeks through all the ordinary courses of nature and operation of law to
further His creatures' good, and whose will, when that end is to be served, is not restricted
to any one necessary mode or order of expression. Rightly interpreted, miracle is not
the mere assertion of power, or a mere device to impress an impossible mind: it is the
revelation of a will which, while leaving nature as a whole to its established course, can yet
witness to itself as above nature, when, by doing so, it can help man's moral and spiritual
being to grow into a higher perfection.

The evidence for the Christian miracles is of a twofold kind—external and internal. As
for the latter, since they are resting upon competent testimony, the testimony of eye-
witnesses, who were neither deceived themselves, nor had any motive to deceive others.
They occurred not in privacy, like the alleged supernatural visions of Mohammed, but for
the most part in the open light of day, amidst the professed enemies of Christ. They were
not isolated facts; nor wrought tentatively, or with difficulty; but the repeated, the over-
flowing expression, as it were, of an apparently supernatural life. It seems impossible
to conceive, therefore, that the apostles could have been deceived as to their character.
They had all the means of scrutinizing and forming a judgment regarding them that
they could well have possessed; and if not deceived themselves, they were certainly not
deceivers. There is no historical criticism that would now maintain such a theory; even
the most positive unbelief has rejected it. The carrier of the apostles forms throughout
an irrefragable proof of the deep-hearted and incorruptible sincerity that animated them.
The gospel miracles, most of which are recorded in the New Testament, are, to use
Chrysostom's phrase, "they are, in the main, miracles of healing, of beneficence, in which the light
equally of the divine majesty and of the divine love shines—witnessing to the eternal
life which underlies all the manifestations of decay, and all the traces of sorrow in the
lower world, and lifting the mind directly to the contemplation of his life.

MIRACLES PLAYS. See MYSTERIES.

MIRACLES, ECCLESIASTICAL. The position of the reformed churches generally
with regard to miracles is that they ceased in the church after the apostolic age,
while the Romanists contend that the power to perform miracles has remained
with the church and will continue forever. The arguments of the reformed are
that when the work of the apostles was finished the necessity for miracles ceased,
and that during the first hundred years after the death of the apostles we hear little or
nothing of the early Christians working miracles. Bishop Douglas says, "I can find no
instances of miracles mentioned by the fathers before the 4th century." In the 4th c.
they speak of the age of miracles as past, and say that they were no longer to be expected.
This is frequently asserted by Augustine, and Chrysostom testifies the same in his ser-
mons on the resurrection and the feast of pentecost. And even when they relate
remarkable deeds performed by Christian believers, and which the Roman Catholics
pronounce miraculous, they declare them to be natural results. Bishop Douglas says
that these wonderful workings were confined to "the cure of diseases, particularly the
cures of demoniacs, by exorcising them; which last seems, indeed, to be their favorite
standing miracle." Even prof. Newman, contrasting the scriptural and ecclesiastical
mysteries, says: "The miracles of Scripture are, as a whole, grave, simple, and majestic;
those of ecclesiastical history often partake of what may not unflitly be called a romantic
character, and of that wildness and inequality which enters into the notion of romance." Yet
Butler says: "Roman Catholics, relying with confidence on the promises of Christ,
believe that the power of working miracles was given by Christ to his church, and that
it never has been and never will be withdrawn from her." And Beilarmine argues that
the Protestant church, lacking this power, is manifestly not of God. Romanists refer to
what Ignatius, of the 1st c. after Christ, relates of the wild beasts let loose upon the
vryates being restrained from hurting them, and to the miracle which prevented the
apostate Julian from rebuilding the temple of Jerusalem. As to the first, Ignatius
regarded the occurrence as wholly in the line of natural events. It is important to notice
the fact that the writings of the ante-Nicene church are more free from miraculous and
superstitious elements than the records of the middle ages, and especially of monasticism.
Dr. Isaac Taylor remarks: "From the period of the Nicene council and onward,
miracles of the most astounding kind were alleged to be wrought from day to day. But
these miracles were, in almost every instance, wrought expressly in support of those
very practices and opinions which stand forward as the points of contrast distinguishing
Romanism from Protestantism, as the ascetic life, the supernatural participation of the
church in the sacraments, the imposition of divine
reverence or worship due to certain visible and palpable religious symbols." Dr. Schaff
makes the following remarks concerning the miracles of the Latin church: 1. Many
of them have a much lower tone than those of the Bible, making a stronger appeal to
our faculty of belief. 2. They serve not to confirm the Christian faith in general, but
to support the ascetic life and many superstitious practices. 3. The farther removed from
the apostolic age the more numerous they are. 4. Most of the church fathers allowed falsehood for the glory of God. 5. Several church fathers concede that in their time extensive frauds with the relics of saints were already practiced. 6. The Nican miracles were doubted and contradicted even among contemporaries. 7. The church fathers contradict themselves sometimes respecting the prevalent faith in miracles, and again maintaining that miracles in the biblical sense had long since ceased. Yet Dr. Schaff remarks that a rejection of these miracles by no means charges intentional deception in every case, for between the proper miracle and fraud there are many intermediate steps of self-deception: clairvoyance, magnetic phenomena and cures, and unusual states of the human soul, which is full of deep mysteries. Constantine's vision of the cross, for example, may be traced to a prophetic dream, and the frustration of Julian's attempt to build the Jewish temple to a special providence. A conclusive argument against God's works, in its nature, is that they are trilling and childish; others indecorous; others irreverent, and even blasphemous. Those contained in the Breviary and Roman ecclesiastical histories are too numerous to recite. Finally, it may be said that many distinguished Roman Catholic authors do not accept these as genuine miracles; even pope Gregory XI., who had been persuaded by the prophecies of St. Catherine of Sienna to return to Rome from Avignon, warning all on his death-bed to beware of human beings, whether male or female, speaking under pretense of religion the visions of their own brain, for by these, he said, he had been led away.

MIRACULOUS CONCEPTION, The, denotes the supernatural formation of the bodily human nature of Jesus Christ from the substance of the Virgin Mary by the operation of the Holy Ghost. The proof by which this central article of Christianity is established was furnished, before the conception took place, by divine revelation to Mary herself and afterwards to Joseph her espoused husband. It is implied also by several particular declarations of Scripture and by its general teaching concerning the incarnate Son of God. It is the point from which is dated by most of the Christian theologians the union of the divine and human natures in the person of the Redeemer; and it gives completeness and consistency to the revelation concerning him. It exalts even his human nature by its immediately divine origin above that of the race to whom he was in all respects made like, yet without sin; and gives the necessary basis for the innumerable implications of the New Testament that his personal relation to the Father was unique in kind as well as degree. As a miracle, it accords with and is no more amazing than the miracle of his character. See INCARNATION; JESUS CHRIST.

MIRAFLORES, MANUEL DE PANDO, Marquis of, and count of Villapaterna, 1792-1872, b. Madrid. He was sent as ambassador to London in 1834, and to Paris in 1838. In 1846 he was president of the council of ministers, and filled the same office in 1863. He was ambassador to Vienna in 1861, and several times president of the senate. He wrote a number of works which are of value for the political history of Spain during the last fifty years. The most important is Memoirs for the history of the first seven years of the Reign of Isabel II.

MIRAGE, a phenomenon extremely common in certain localities, and as simple in its origin as astonishing in its effects. Under it are classed the appearance of distant objects as double, or as if suspended in the air, erect or inverted, etc. One case of mirage is a diminution of the density of the air near the surface of the earth, produced by the transmission of heat from the earth, or in some other way; the denser stratum being thus placed above, instead of, as is usually the case, below the rarer. Now, rays of light from a distant object, situated in the denser medium (i. e., a little above the earth's level), coming in a direction nearly parallel to the earth's surface, meet the rarer medium at a very obtuse angle, and (see REFRACTION) instead of passing into it, are reflected back to the observer, as a mirror. Suppose, then, a spectator to be situated on an eminence, and looking at an object situated like himself in the denser stratum of air, he will see the object by means of directly transmitted rays; but besides this, rays from the object will be reflected from the upper surface of the rarer stratum of air beneath his eye. The image produced by the reflected rays will appear inverted, and below the real object, just as an image reflected in water appears when observed from a distance. If the object is a cloud or portion of sky, it will appear by the reflected rays as lying on the surface of the earth, and bearing a strong resemblance to a sheet of water; also, as the reflecting surface is irregular, and constantly varies its position, owing to the constant communication of heat to the upper stratum, the reflected image will be constantly varying, and will present the appearance of a water surface ruffled by the wind. This form of mirage, which even experienced travelers have found to be completely deceptive, is of common occurrence in the arid deserts of lower Egypt, Persia, Tartary, etc. Often during this distance the object, as in the case of a tower or church seen over the sea, or a
vessel over dry land, etc. The particular form of mirage known as 

**miraculous** is very frequently observed at sea, and consists in an excessive apparent elevation of the object. A most remarkable case of this sort occurred on July 26, 1798, at Hastings. From this place the French coast is fifty miles distant; yet, from the seaside the whole coast of France from Calais to near Dieppe was distinctly visible, and continued so for three hours. In the Arctic regions it is no uncommon occurrence for whale-fishers to discover the proximity of other ships by means of their images seen elevated in the air, though the ships themselves may be below the horizon. Generally, when the ship is above the horizon, only one image, and that inverted, is found; but when it is wholly or in great part below the horizon, double images, one erect and the other inverted, are frequently seen. The faithfulness and distinctness of these images at times may be imagined from the fact, that capt. Scoresby, while cruising off the coast of Greenland in 1822, discovered the prohality of his father's ship from its inverted image in the sky. Another remarkable instance of mirage occurred in May, 1854, when, from the deck of H. M. screw-steamer Archer, then cruising off Osel, in the Baltic, the whole English fleet of nineteen sail, then nearly thirty miles distant, was seen as if suspended in the air upside down. Besides such phenomena as these, the celebrated **Fita Morgana** (q.v.) of the straits of Messina sinks into insignificance. The **Spectre de los Broeken**, in Hanover, is another celebrated instance of mirage. Its varieties are indeed numberless, and we refer those who wish for further information to Brewster's *Optics*, Biot's *Traité de Physique*, and for the mathematical theory of the mirage to the works of Biot, Monge, and Wollaston. See also Reflection and Refraction.

**MIRAMICHI RIVER**, the second largest river in New Brunswick. It is formed by the junction of its two branches, the n.w. and s.w. Miramichi. It flows, after a course of about 100 m., into the bay of Miramichi, a part of the gulf of St. Lawrence. Pine woods line the banks of the river, which is navigable for vessels of moderate size for a distance of 30 m. from its mouth.

**MIRAMON, Miguel**, 1832-67; b. Mexico, of French extraction. He was educated at the military academy at Chetulpe, near the city of Mexico, and was one of the defenders of that stronghold against the American assault, Sept. 8, 1847, being wounded and taken prisoner. At the end of the war he was released, and filled his term in the academy. In 1852 he was regularly enlisted in the Mexican army, and two years later had gained the rank of captain. He was distinguished in several revolutionary engagements, and was promoted to be a colonel in 1855. The existing political situation becoming reversed, and Alvarez being president, Miramon found his position in the army a very delicate one. Being sent on an expedition against the enemies of the new government, he rebelled on his own account, and turned his force over to the revolutionists, whom he commanded in a successful attack on Puebla. That city being besieged by order of Alvarez, Miramon defended it with remarkable skill and spirit on two occasions. It capitulated to an overpowering force in the latter part of 1856, and Miramon, having escaped, conducted an independent fight until he was wounded and captured in the following year. He succeeded in obtaining his release, and continued to resist the government until Comonfort, who had succeeded Alvarez, retired from the presidency. The struggle now began which was supposed Mexican history as the "war of the three Andrés," in which Miramon was conspicuous on the side and at the head of the church party. Zuloaga had already succeeded Comonfort in the presidency, and on a new election Miramon was named as his successor, but declined. On the retirement of Zuloaga, however, he was appointed president *pro tem.*, when at the head of the army he continued the war against the liberals and Juarez. He was concerned in, and partly responsible for, the miserable massacre of Tacubaya in 1859. In the latter part of 1860 the liberals were successful, and Miramon fled the country. He traveled in Europe until the French intervention and the accession of Maximilian as emperor, when he received a diplomatic position abroad. In 1866 he returned to Mexico, and, with Marquez, was placed in command of Maximilian's army. He was captured May 15, 1867, and, with the emperor and gen. Mejia, was shot June 19.

**MIRANDA, Francisco**, about 1750-1816; b. Caracas, South America. He accompanied the French forces in their campaign in aid of American independence, then returned to South America and attracted attention by endeavoring to incite a revolution among the Spanish troops over whom he was col. He was compelled to flee, however, and next traveled in Europe, where he obtained the friendship, particularly of the Russian empress Catherine II., William Pitt, and leaders in the French revolution. While in Paris, the French empress appointed him a maj. gen., and he attended Dumontiez in his campaign against the Prussians. Though he was a skillful commander, the forces under his command met with little success; and a defeat at Neerwinden was attributed to his treachery, a suspicion that caused his arrestment before the revolutionary tribunal. After the fall of the Girondists he was threatened with transportation, and fled to England. In 1803 Napoleon banished him again, and he visited New York, where he obtained assistance in a second attempt to overthrow the power of Spain in South America. Two vessels were fitted out for him, and he sailed for South America in 1806. But the undertaking came to nothing, and it was not until 1810 that he succeeded in gaining a triumph, and compelled the submission of Valenita,
Puerto Cabello, and nearly the whole of New Granada. This lasted a yea. The Spanish monarchy then gained the ascendency; Miranda was forced to surrender; and, in violation of the conditions, he was sent to Spain, where he died in the dungeons of the inquisition.

MIRANDOLA, a t. of northern Italy, in the province of Modena, and 20 m. n.n.e. of the city of that name. It stands in the midst of a low-lying and somewhat unhealthy flat, and contains numerous churches, a cathedral, and a citadel. Rice is much cultivated in the vicinity, and the breeding of silk-worms is an important branch of industry. Pop. of town, 71, 5,069; of commune, 13,170.

MIRANDOLA, Pico della. See Pico, Giovanni della Mirandola, ante.

MIRBEL, Lucasina Aimée Zoé Rue, 1796-1849; b. at Cherbourg, France. Most of her life was spent in Paris, where she married in 1820 the celebrated naturalist, Charles-François Brisseau Mirbel, and won a high reputation as a miniature and portrait painter.

MIRECOURT, a t. of France in the department of Vosges, in a picturesque district, 20 m. s. of Nancy. It is famous for its manufactures of lace, and of church organs and stringed musical instruments. Pop. 76, 5,162.

MIÈRES, Jules, 1809-71; b. in Bordeaux, of Jewish parentage. He opened in Paris as a broker, became director in a gas company, and in 1848 purchased the Journal des Chemins de Fer in company with Moise Millau. They afterwards purchased the Conseiller du Peuple, the Constitutionnel, and other journals; then founded the Caisse des Chemins de Fer, or railway bank, and, by means of all these agencies skillfully employed, acquired great fortunes. In 1860 Mières negotiated a Turkish loan. In 1861 he was arrested for fraud and condemned to five years' imprisonment and a fine. Appealing from the first decision to the imperial court the judgment was confirmed; the court of cassation set it aside; but on a second trial before the same court the judgment was finally affirmed, and Mières served in the penitentiary till 1866, when he returned to Paris, resumed banking, and published Un Crime Judiciaire.

MIRFIELD, a manufacturing village of the West Riding of Yorkshire, England, three m. c. of Dewsbury. The manufactures are fancy and other woolen fabrics, and cotton goods. It is one of the chief railway centers in the country. Pop. 71, 12,869.

MIRIAM (Gr. Marina, Lat. Maria, Eng. Mary), the sister of Moses, the leader and lawgiver of the Hebrews. She is presumed to be the sister who watched him when an infant concealed in a basket on the banks of the Nile. On occasion of the deliverance of Israel from Pharaoh and his host at the Red sea, she led the Israelitish women forth with music, taking up in response the song of Moses, and enjoining her followers to “Sing to the Lord.” She is styled Miriam the prophetess, and in the book of Micah is classed with Moses and Aaron in the words, “I sent before thee Moses, Aaron, and Miriam.” She seems, however, to have been the instigator as well as a sharer in the rebellion of Aaron against Moses on occasion of the coming of Moses’s wife to the camp, as the whole punishment was visited upon her. She died, and was buried in the first month after the 40th year of the Exodus, at Kadesh-barnah, where her sepulcher was still shown in the time of Eusebius.

MIRKHOND, 1483-68; b. Persia; the author of a voluminous work relating to Persian history, entitled Garden of Purity in the History of the Prophets, Kings, and Caliphs, of which there are manuscripts in the libraries of London, Paris, Berlin, and Vienna. Besides the fragments in Wilkins’s Persian grammar, portions of the work have been published in Persian and Latin in The History of the Persian Kings, by the German scholar Jentsch; also, in Silvestre de Sacy’s Mémoires sur diverses Antiquités de la Perse, in Jourdain’s Notice de l’Histoire Universelle de Mirkhond, and in English by David Shea under the title of History of the Early Kings of Persia (London, 1832).

MIRPUR, a flourishing t. of India, in Sinde, on the left bank of the Indus, 45 m. s. of Hyderabad. It contains a fort capable of accommodating 200 men, and which commands the route from Hyderabad to Cutch. The surrounding district is fertile and well cultivated. Pop. 8,000.

MIRROR, a reflecting surface, usually made of glass, lined at the back with a brilliant metal, so as strongly to reflect the image of any object placed before it. When mirrors were invented is not known, but the use of a reflecting surface would become apparent to the first person who saw his own image reflected from water; and probably for ages after the civilization of man commenced, the still waters of ponds and lakes were the only mirrors; but we read in the Pentateuch of mirrors of brass being used by the Hebrews. Mirrors of bronze were in very common use among the ancient Egyptians, Greeks, and Romans, of which many specimens are preserved in museums. Praxiteles taught the use of silver in the manufacture of mirrors in the year 328 B.C. Mirrors of glass were first made at Venice in 1300; and judging from those still in existence—of which one may be seen at Holyrood palace, in the apartments of queen Mary—they were very rude contrivances, compared with modern ones. It was not until 1675 that the making of mirrors was introduced into England. It is now a very important manufacture; and mirrors can be produced of any size to which plate glass can be cast. After the plate of glass is polished on both sides, it is laid on a perfectly level table of great
strength and solidity, usually of smooth stone, made like a billiard table, with raised edges; a sheet or sheets of tin foil sufficient to cover the upper surface of the glass are then put on, and rubbed down smooth, after which the whole is covered with quick-silver, which immediately forms an amalgam with the tin. The superfine mercury is then run off, and a woolen cloth is spread over the whole surface, and square iron weights are applied. After this pressure has been continued a day and night, the weights and the cloth are removed, and the glass is removed to another table of wood, with a movable top, which admits of gradually increasing inclination until the unmallamagnated quick-silver has perfectly drained away, and only the surface of perfect amalgam remains coating the glass, and perfectly adherent to it.

Heat is reflected like light; so that a concave mirror may be used to bring rays of heat to a focus. In this way combustible substances may be set on fire at a distance from the reflector whence they receive their heat. Thus used, a mirror is called a burning-mirror.

MIRTA, a t. of India, in the Rajpoot state of Jodhpur, stands on high ground, near the source of a tributary of the Luni, 230 m. s.w. of Delhi. Mirta is supplied with good water from three large tanks. Pop. estimated at 25,950.

MIRZA, a contraction of Emir Zadah, "son of the prince," is, when prefixed to the surname of the individual, the common title of honor among the Persians; but when annexed to the surname, it designates a prince or a male of the blood-royal.

MIRZAPUR, a t. of British India, capital of the district of the same name, on the right bank of the Ganges, which is here half a mile wide, and crossed by a ferry, 40 m. s.w. of Benares. It has some manufactures of carpets, cottons, and silks, and is the greatest cotton-mart in India. Pop. '72, 67,774. The district of Mirzapur, in the North-west Provinces, is watered by the Ganges and the Sone. Lat. 29° 30' to 25° 30' n.; long. 88° 11' to 88° 39' e. Area, 5,255 sq. miles. Pop. '72, almost all Hindus, 1,051,413. The chief productions, besides the usual cereals, are cotton, indigo, and sugar. The climate is, on the whole, unhealthy for Europeans.

MISDEMEANOR is one of the technical divisions of crimes, by the law of England and Ireland. The usual division of crimes is into treason (which generally stands by itself, though, strictly speaking, included in), felony, and misdemeanor. The offense of greatest enormity is treason, and the least is misdemeanor. The original distinction between felony and misdemeanor consisted in the consequences of a conviction. A party convicted of felony, if capital, forfeits both his real and personal estate; if not capital, his personal estate only. A party convicted of misdemeanor forfeits none of his property. The distinction is not kept up between the two classes of crimes by any greater severity of punishment in felony, for many misdemeanors are punished as severely as some felonies. But it has been the practice of the legislature, when creating new offenses, to say whether they are to be classed with felony or misdemeanor; and when this is done, the above incidents attach to the conviction accordingly.

MISDEMEANOR (ante), in the United States, is such a criminal act under common law or statute as is not included in common law or statutory felonies and is not treason. The term does not include, in its legal application, offenses against police regulations, city by-laws, and the like, though in common language it may extend to any misbehavior. It is evident that what is a statute-felony in one state may be a misdemeanor in another, and it is therefore impossible to give a complete classification of such offenses. They may be crimes against public justice, peace, health, or trade; against personal or property rights of individuals; or may be mere attempts and solicitations. Bouvier defines the word as applied to all those crimes and offenses for which the law has not provided a particular name. Sometimes, but in this country rarely, the term misdemeanor is used to include all higher classes of misdemeanor. Misdemeanor may be punished by trial brought either after indictment or information—that is, presentation by either a grand jury or a public prosecutor; and in most states the rule prevails that where felony is charged in the indictment but the evidence proves only an offense amounting to misdemeanor, conviction may be had of the latter.

In some states it is provided that upon acknowledgment of satisfaction by the injured party, in such cases as assault and battery or malicious mischief, the criminal procedure shall, with the consent of the magistrate, be dropped; a course which, obviously, would be improper in dealing with felonies.

MISENO, a promontory of the province of Naples, 9 m. s.w. of the city of Naples. On the outskirts of the promontory are the extensive ruins of the ancient city of Misenum, including a vast church and theater. Misenon is much visited on account of its wonderful grotto Dacconara, and a curious subterranean building or labyrinth, called the Hundred Chambers, supposed to have been anciently employed as dungeons.

MISERE, the name by which, in Catholic usage, the 50th psalm of the Vulgate (51st in authorized version) is commonly known. It is one of the so-called "Penitential Psalms," and is commonly understood to have been composed by David in the depth of his grief over the death of his son Absalom, though the crime was committed by the prophet Nathan rebuked in the well-known parable (2 Sam. vii.). Another opinion, however, attributes this psalm to Manasseh, or to some of the psalm-writers of the captivity. The Miseré is of frequent occurrence
in the services of the Roman church; and in the celebrated service of Tenebrae, as performed in the Sixtime chapel at Rome, it forms, as chanted by the pope's choir, one of the most striking and impressive chants in the entire range of sacred music. It is sung on each of the three nights in holy week (q.v.) on which the office of Tenebrae is held, with different music on each of the three occasions, the three composers being Bai, Baini, and the still more celebrated Allegri.—Miserere is also the name of one of the evening services in Lent, which is so called from the singing of that psalm, and which includes a sermon, commonly on the duty of sorrow for sin.

MISERERE, a projection on the under side of the seats of the stalls of mediæval churches and chapels, etc. They are usually ornamented with carved work, and are so shaped that when the seats proper are folded up, they form a small seat at a higher level, sufficient to afford some support to a person resting upon it. Aged and infirm ecclesiastics were allowed to use these during long services.

MISFEA SANCE, in legal language, means the doing of a positive wrong, in contraposition to nonfeasance, which means a mere omission. Acts are sometimes followed with different legal consequences, according as they fall under the head of misfeasance or nonfeasance.

MISHAWA'KA, a village in n. Indiana, a part of the township of Penn, on the s. bank of the St Joseph river, navigable to this place, and furnishing great water-power; pop. 70, 2,617. It is 4 m. e. of South Bend, and 11 m. w. of Elkhart, and has a station on the Northwestern Grand Trunk railway, and the Lake Shore and Michigan Southern. It has excellent public schools, 7 churches, 1 bank, water-works, and important industries, comprising the manufacture of flour, axes, refrigerators, wind-mills, pumps, brushes, furniture, agricultural implements, etc., and a variety of stores.

MISH ME BITTER, the root of Cop'is heda (see Coemae), a plant found in the mountainous regions on the borders of India and China; of the same genus with the golden thread of the northern parts of the world, and not unlike it. The root is in much use and esteem in some parts of the east as a tonic and tonic, and has begun to be known in Europe.—The root of C. trifolata is also used as a bitter.

MISHMA (from Heb. shama, to learn; erroneously held to designate repetition) comprozes paxy of the "oral law," or the juridico-political, civil, and religious code of the Jews; and forms, as such, a kind of complement to the Mosaic or written law, which it explains, amplifies, and immutably fixes. It was not, however, the sole authority of the schools and the masters on which these explanations and the new ordinances to which they gave rise depended, but rather certain distinct and well-authenticated traditions, traced to Mount Sinai itself. No less were certain special letters and signs in the written law appealed to in some cases, as containing an indication to the special, newly issued, or fixed prohibitions or rules. See HALACHA. The Mishna (to which the Toseftas and Boraithas form supplements) was finally redacted, after some earlier incomplete collections, by Jehudah Hanassi, in 230 A.D., at Tiberias. It is mostly written in pure Hebrew, and is divided into six portions (Sedarim): 1. Zera'im (Seeds), on Agriculture; 2. Moed (Feast), on the Sabbaths, Festivals, and Fasts; 3. Nashim (Women), on Marriage, Divorce, etc. (embracing also the laws on the Nazirship and vows); 4. Nezikin (Damages), chiefly civil and penal law (also containing the ethical treatise Aboth); 5. Kadashim (Sacred Things), Sacrifices, etc.; description of the Temple of Jerusalem, etc.; 6. Tchotroth (Purifications), on pure and impure things and persons. See also TALMUD.

MISILMIRI (corrupted from Mena'all-AMIR, village of the Emirs), a t. of the island of Sicily, in the province of Palermo, 7 m. s.e. of Palermo city. It is a struggling, poverty-stricken town. It was at Misilmeri that Garibaldi, in May, 1860, joined the Sicilian insurgents; and it was by a short cut from Misilmeri to Palermo, through the pass of Mezzagnia, that he advanced on the latter city and took it by a coup de main. Misilmeri used to be a notorious harbor of banditti. Pop. 7,250.

MISKOLC, the principal t. in the co. of Borsod, Hungary, situated at the extremity of a beautiful valley, 35 m. n.e. of Erlau. It is connected with Debreczin by railway, and contains numerous churches, two gymnasium, and other educational institutions. Wine and melons are extensively cultivated. From the iron obtained in the vicinity, the best steel in Hungary is made. The chief trade is in wine. Pop. 70, 21,119.

MISNIA. See MEISEN, ante.

MISNO MER, the giving of a wrong name to a party in a suit. Formerly the objection of misnomer was of some importance, but now is of none, as it is easily cured by amendment.

MISNOMER, an instance of erroneous or erratic nomenclature, often proceeding on the locus a non lucendo principle, as in the case of the so-called "German silver," which is not silver, was not invented or discovered by a German, and was in use in China ages ago. Among the large number of expressions which may be called misnomers the following are in common use in the English language: Black-lead, which is compounded of carbon and iron; blind-worms, which are not blind; Brazilian grass, which is not grass, but strips of palm-leaf, and comes from Cuba and not Brazil; Burgundy pitch is
not pitch, but is prepared from frankincense and comes from Hamburg; catgut is the gut of sheep, instead of cats; china, applied to porcelain, whether English, French, or of other countries; cuttle-bone, which is not bone, but a chalky deposit contained in a sac occurring in the body of the cuttle-fish; Cleopatra's needle, which was erected by Rameses the great, and had no reference to Cleopatra; Dutch clocks, made in Germany instead of Holland; galvanized iron is not galvanized, but coated with zinc in a bath of muriatic acid; Gothic architecture was not the architecture of the Goths, but originated in England and France at a period prior to the renaissance; Indians (North American), applied to the aborigines of America by the early voyagers, who supposed that country to be a part of India; Irish stew, a dish unknown in Ireland; bael is made not from bae, but from a resin obtained from a nut-tree (acamerlante); kid gloves, which are made of lamb, sheep, or rat skins; lunar caustic (nitrate of silver), so called because silver is the astrological symbol of the moon; meerschaum (foam of the sea), which is a compound of silica, magnesium, and water; pen, from the Latin penna, a wing, referring to the quill, becomes inappropriate when applied to a fabrication of steel or gold; Pompey's pillar was not erected by or in honor of Pompey; rice-paper, which is made not from rice, but from the pith of a Chinese plant of totally different character; salt, which is not chemically a salt; scuttle, applied to opening a hole in a ship, really means to close or bar; sealing-wax, which is not wax, but is composed of shellac, turpentine, and cinnamon; slave, which originated in a word (slavi) meaning illustrious, noble; tube rose, which is not a rose; turkeys, which did not originate in Turkey, but in North America; whalebone, which is not a bone.

MISSPICK'EL, a mineral that occurs in tricrystalline crystals and which is composed of 33.54 per cent of iron, 33.42 per cent of arsenic, and 21.08 per cent of sulphur. Its color is silver-white, inclining to steel-gray; its hardness, 5.5 to 6; and its specific gravity, 6 to 6.4. Heated in a tube, it first yields a red or brown sublimate of sulphide of arsenic, then a black sublimate of metallic arsenic. Nitric acid decomposes it, with separation of sulphur and arsenious acid; nitro-muriatic acid, with separation of sulphur alone, which may be completely dissolved by prolonged digestion. It is found principally in crystalline rocks, especially associated with silver, tin, lead, and zinc ores; and is used chiefly in the manufacture of white arsenic.

MISPRISION is, in English law, a clerical error made in drawing up a record of a court of law.

MISREPRESENTATION, in point of law, or, as it is most frequently termed, fraudulent misrepresentation, is that kind of lie for which courts of law will give redress. It consists in a willful falsehood as to some material thing connected or not with some contract; the object being that the party deceived should act upon it as true. The legal result is, that if the party so relying on its truth and acting on it suffer damage, he can sue the deceiver for such damage. It has sometimes been supposed that the deceit or misrepresentation must have reference to some particular contract, or arise out of some confidential relation between the parties, and that the party making it should have some private interest to serve; but this is mistake; and recent cases have established, that if a person willfully—i.e., either not knowing anything at all one way or the other about the matter, or knowing the real truth, misrepresent something with the intention that a stranger should act upon such misrepresentation, and such stranger does so act on it, and suffer damage, then the right of action accrues to the deceived party. One remarkable exception to this doctrine, however, occurs in the case of the contract of marriage, where either party has in general no remedy whatever against the other for misrepresentations as to his or her property, connections, etc. It is not necessary that the misrepresentation should be made in writing, in order to give rise to the action, except in cases where the party gives representations as to the conduct, credit, ability, trade, or dealings of a third party, in order that such third party shall obtain credit, money, or goods thereby. The doctrine of misrepresentation has acquired great consequence of late, owing to the extension of the system of joint-stock companies, and the practice of the directors and officers publishing or being parties to fraudulent reports, accounts, and circulars as to the credit and stability of such undertakings. It is now settled, that not only every director, but every clerk in the service of the directors, who knowingly and willfully concurs and takes a part in publishing or circulating such false reports, whereby strangers are led to believe and act on them, and thereby suffer pecuniary loss, is liable to an action of damages at the suit of such strangers. It is also a general rule affecting contracts (other than marriage), that misrepresentation in some material point bearing on the contract, and likely to induce the party to enter into such contract, will render the contract void; but in order to make a trifling misrepresentation have the same effect, the party must warrant such representation to be true; in which case, whether trifling or not, or whether willful or not, a misrepresentation avoids the contract; and this is generally the case in contracts of life and fire insurance. Against such a practice lord St. Leonards lately remonstrated, as one involving great hardship to the class of insurors, who, after paying premiums for years, find at last their security gone. Another class of fraudulent misrepresentations, of great consequence, and now brought within the criminal law to a large extent, is that of counterfeiting trademarks, as to which, see TRADE-MARKS.
MISSA DI VOCE, a term used in the art of singing, meaning the gradual swelling and again diminishing of the sound of the voice on a note of long duration.

MISSAL, the volume containing the prayers used in the celebration of the mass. Although, considerable variety in minor details prevailed among the books in use in different countries, and even in different churches of the same country. With the view of restoring uniformity, the pope, in virtue of a decree of the council of Trent, in 1570, ordered that all churches which had not, for a clearly ascertained period of 200 years, enjoyed an uninterrupted use of a peculiar service-book of their own, should henceforth adopt the Roman missal. Of this exemption, several churches in Germany, France, and even in Italy, availed themselves; but in later times the great majority have conformed to the Roman use. The Roman missal has twice since that date been subjected to revision and correction—in 1604 by Clement VIII., and in 1634 by Urban VIII. The latter recension still continues in use. The missals of the oriental rites differ from that of the Roman church, each having for the most part its own proper form. See Liturgy.

MISSAL (ante), Lat. missale plenarium or plenarium, the book which contains the ritual for the celebration of the various masses of the Roman church, was called in the early western church sacramentarium, but at that time it contained only parts of what is now included in the missal. Those copies which contained the gospels, the sacramentary, prayers, prefaces, benedictions, the canon, lectionary, epistles and the antiphon were called plenaria; but commonly these parts of the missal were in separate volumes. The entire mass was required when the priests began to say low masses. The earliest Gothic or Gallican missals of the 6th c. contained only the canon, prayers, and prefaces, which were recited by the bishop or priest; afterwards, those of small churches had the introit, gradual, alleluia, offertory, sanctus and communion. To meet a general desire for an emendation of the missal it was decided by the council of Trent, after a protracted discussion, to recommend to the pope the reform of the breviary, missal, and rituals. He consented, and the work was begun in Rome under Pius IV., and finished under Pius V. in 1570. The new missal consists of an introduction, three parts, and an appendix. The introduction gives the calendar and the general rubries; the three parts give the formularies for the successive services of the year, those for the celebration of the mass on special feasts of saints, etc.; the appendix gives the annual mass, masses for the dead, some benedictions, and masses for certain prescribed feasts. In the English church before the reformation the missals were very different, and even after the completion of the Roman missal, the English were generally used; but at the end of the 16th c. the Jesuits forced the Roman missal upon the Roman Catholic churches of England. Before the invention of printing, the missals were elegantly written, ornamented with beautiful initials, and superbly bound. In the 13th c. large letters were used in writing the missals.

MISSAU KEE, a co. in central Michigan, drained by Clam lake, Muskrat lake, and the headwaters of the Muskegon, Manistee, and Clam rivers; 576 sq.m.; pop. '80, 1558—904 of American birth. Its surface is considered fertile, is generally level, with a large proportion of timber land, and very thinly settled. Capital, Lake City.

MISSINIPPI RIVER. See CHURCHILL RIVER, ante.

MISSION, a term used by Roman Catholics and English and American ritualists in a sense similar to the word ritual. Among Roman Catholics a mission consists of special religious services conducted generally by one who has no parish, and belongs to a monastic order. In this sense the word is modern. In the church of England and the Protestant Episcopal church in the United States the word denotes "a series of services in which prayer, praise, preaching, and personal exhortation are the main features, and is intended to call souls to repentance and faith, and deepen the spiritual life in the faithful." It is held in a parish or several parishes under the direction of the rector, or by some experienced priest whom he obtains to assist him. "Its themes are heaven, hell, the judgment, sin, the atonement for sin, God's justice and God's mercy." The purpose is the proclamation of the old foundations of faith and repentance to souls steeped in worldliness and forgetful of their destiny, whether they be the souls of the baptized or the unbaptized." The usual time for the "mission" is Lent. In England it has been a custom for several years, and is approved by the bishops, who prescribe no rules for its observance, but leave it to the good judgment of the clergy. It is not yet favored by many in the Episcopal church in the United States. In these services the prayers are, or at least may be in part, extemporaneous; much preaching is allowed, and the preaching is earnest, personal, and practical; familiar hymns and tunes are used, and the singing is congregational. The Church Journal and Gospel Messenger favors the "mission." 

MISSIONS, enterprises of the Christian church for the conversion of the nations to Christianity, by sending to them teachers called missionaries.

The first Christians displayed great zeal in preaching the gospel to the heathen; Christian teachers continued to go forth for this purpose into heathen countries until about the 9th c., and although other and less worthy means were too often employed, the labors of Palladius in Ireland, of Columba in Scotland, of Augustine in England, of Gallus and Ennemar in Alemania, of Kilian in Bavaria, of Willibrord in Francenia, of Swidvirt in Friesland, of Siegfried in Sweden, of Boniface in Thuringia and Saxony, of
Adalbert in Prussia, of Cyril and Methodius amongst the Slavonians, and of many such early missionaries, were unquestionably very instrumental in the extension of Christianity in Europe. After the reformation, the Roman Catholic Church, roused to activity by its losses and dangers, not only sent forth missionaries to confirm its adherents in Protestant countries, and to win back Protestants, but also sought to repair its losses by new acquisitions from the vast domain of heathenism. With this view, the Congregatio de Propaganda Fide was constituted by Gregory XV. in 1622, and the Collegium de Propaganda Fide (see Propaganda) by Urban VIII. in 1627, and in a number of places institutions called seminaries were established for the training of missionaries. Jesuit missionaries earnestly prosecuted their work amongst the Indians of South America, from the middle of the 16th c. to the middle of the 18th, when they were expelled by the Portuguese and Spanish governments, because their political power had become too formidable. They are accused of administering baptism with too great readiness; but they were certainly successful in extending civilization amongst the Indians, particularly of Paraguay. Jesuit missions to India and Japan were founded by Francis Xavier (q.v.) in the middle of the 16th century. In Japan, the missionaries made great progress at first; and in 1583 they boasted of 150,000 converts, 200 churches, and 59 religions houses of their order in that empire; but ere the middle of the 16th c. the whole work was overthrown, and every missionary expelled. In China similar rapid success was enjoyed, and was followed by a similar period of persecution, although the destruction effected was more partial than in Japan, and the church of Rome continued to subsist in China, its missionaries and members enduring great hardships, and many of them evincing their sincerity even by their death. There are not a few Roman Catholics in China at the present time. In Abyssinia, also, the Jesuits made great progress in the 17th c., and for a time attained great power in the country; but their interference in political matters led to the complete expulsion. In the 17th c. the Jesuits boasted of the vast success of their mission in Madura, a province of southern India; but it was found to be rather apparent than real, and to have been attained by a compromise of Christianity and the employment of unworthy means, so that, after long contests in the papal court, a decision was pronounced against the Jesuits, and their connection with Madura was dissolved in the middle of the 18th century.

For a long period after the reformation, the Protestant church seems to have been little sensible of the duty of laboring for the propagation of Christianity; nor was it until the present century that missionary zeal began to be largely developed. In the middle of the 17th c. (1647), indeed, an act of the English parliament established the Society for Propagating the Gospel in Foreign Parts, and at the close of the century (1698) the Society for Promoting Christian Knowledge was established. A few missionaries labored with zeal and success among the North American Indians, in which field the names of Elliot and Mayhew are particularly distinguished in the 17th c., and that of Brainerd in the 18th; but the commencement of more systematic and continuous missionary enterprise may be reckoned from the establishment of the first Protestant mission to India, which did not take place till the beginning of the 18th c., when Bartholomew Ziegenbalg and another were sent thither by Frederick IV. of Denmark, and settled in a small territory then belonging to Denmark on the coast of Coremandel. The mission in the s. of India soon received the support of the English government, and its success was mainly due to the work of the Jesuits. In 1704 the mission to China was re-established, and the work was improved. Amongst the missionaries who labored in this field, the name of Swartz is particularly distinguished; and the success which attended his exertions, and the influence which he acquired in the country, were equally remarkable. He died in 1758.

Since that time, the missionary work in the s. of India has been carried on with continued success, and by the missionaries of a number of societies. Greater progress has been made there than in any other part of India, and, indeed, was the work commenced in any other part of India till almost a century later.—The Moravian church early entered upon missionary enterprise, and was the first Protestant church which did so in its united or corporate character; and very successful missions of the United Brethren were planted in the 18th c. at the cape of Good Hope, in the West Indies, and in Labrador. Greenland had previously been made the field of similar enterprise by missionaries from Norway. The mission to Greenland was founded by Hans Egede (q.v.) in 1725, and has been maintained by the Danes ever since. Its success has been such, that the greater part of the Greenlanders have now been converted to Christianity, and much of the rudeness of their former manner of life has disappeared.—Towards the close of the 18th c., some of the great missionary societies still existing in England were formed—the Baptist Missionary Society in 1792, the London Missionary Society in 1795. About the same time the British and Foreign Bible Society and the Religious Tract Society were formed, which have co-operated with all the missionary societies as most important auxiliaries. The Baptist Missionary Society, immediately after its formation, sent missionaries to the n. of India. Dr. Carey was one of its first, and also one of its most eminent missionaries. India is now a field of labor for many missionary societies, not only of Britain, but also of America and of the continent of Europe.
Missions.

in other islands, so that now many of the islands of the South Seas are entirely Christian. The London missionary society seem not to have in other fields of labor, and now maintains missions to many parts of the world. It was at first composed of members of almost all Protestant denominations; but the formation of other societies, and the engagement of churches as such in missionary enterprise—as the Wesleyan Methodist church—have left this society now in a great measure to the English independents. One of the most important societies founded during the present century, the Church Missionary Society, formed by members of the Church of England, has sent forth missionaries to many fields. They have been particularly successful in New Zealand, the w. of Africa, and about Hudson's bay; and they recently entered Abyssinia. The various churches in Scotland also support vigorous mission agencies. The late Dr. Livingstone, of the London missionary society, explored vast regions in Central Africa. Fired by his example, the friends of missions in Scotland subscribed £32,000 to found Livingstoneia, a memorial mission station on lake Nyassa, under the management of the Free Church foreign missions committee; and an expedition arrived there and established itself in 1873. Various other missionary societies, Catholic and Protestant, have selected stations in the region of the great lakes. The Wesleyan Methodists have missions in many parts of the world. They have been particularly successful in the Fiji islands, and in parts of the w. of Africa.—The American Board of Commissioners for Foreign Missions was formed in 1810, and was soon followed by other missionary societies in America, some of which rival those of Britain in magnitude and importance. One of the first enterprises of the American board was the mission to the Sandwich islands, founded in 1819, which has resulted in the general Christianization of these islands, and in their civilization to a degree which, considering the shortness of the time, may well be regarded with admiration. The American Baptist Missionary Society has occupied Bumannah and the eastern peninsula as one of its principal spheres of labor, and there its missionaries have enjoyed remarkable success in the Christianization and civilization of the people called Karens. Protestant missions to Africa have been founded on the shores of Europe, of which the first was that of Basel, in 1816, and the next was that of Berlin, in 1823. Both of these have also maintained successful missions in heathen countries. The instances of most marked and extensive success of missions are those which have been already noticed, and that of Madagascar, where missionaries of the London missionary society enjoyed the protection and favor of king Radama I., and the church planted by them continued to exist, notwithstanding severe persecution, and the martyrdom of not a few of its members, during the next reign, and is a wonderfully flourishing church at the present day. In the s. of Africa, also, important results have been attained. Access has recently been obtained to China, and a number of Protestant churches and societies have entered energetically upon that field. Preparation had been previously made for this, by missionary labors amongst the Chinese in the eastern peninsula, and by the study of the language, the compilation of grammars and dictionaries, and the translation of the Bible into the Chinese language. Indeed, it must be reckoned as among the services rendered to mankind by Christian missionaries in modern times, that they have not only translated the Bible and other religious books into many languages, but have reduced many barbarous tongues to writing, and have prepared grammars and dictionaries, thereby contributing not a little, independently of their highest aim, to the promotion of knowledge, civilization, and the welfare of the human race.

The progress of Christian missions to Mohammedan countries has hitherto been very small, although numerous converts from Mohammedanism, as well as from heathenism, have been made in India. Of late, some have thought they observed a movement among the Mohammedans of India, apparently tending toward Christianity; but at the same time there has been a new awakening of Mohammedanism itself in the eastern peninsula and the islands of the Malay archipelago. Missions to the Jews have for several years engaged not a little of the attention of some portions of the Christian church, particularly in England and Scotland. Missions have been planted in places where Jews are numerous, and already with considerable success.

MISSIONS, CHRISTIAN, FOREIGN (ante). The foundation of the work of missions is the command of Christ given to his disciples immediately before his ascension, "Go ye into all the world, and preach the gospel to every creature." Tracing the apostles and early Christians in their fulfillment of this command, we find at the close of the 1st c. many large churches in Asia Minor, Macedonia, Italy, Greece, and the islands of the Mediterranean, and in Northern Africa. In the beginning of the 2d c. the persecutor Pliny, in his official report to the emperor Trajan, says: "Many persons of every rank are accused [of Christianity]. Nor has the contagion of this superstition pervaded cities only, but the villages and open country." Justin Martyr, a.d. 106, says, "There is not a nation, Greek or barbarian, among whom prayers and thanksgivings are not offered to the Father and Creator in the name of the crucified Jesus." Tertullian, in his "Apology" about the middle of the 2d c. says, "Though we esteem the name of thebabel, the name of the Babel, the church, the palace, the forum." Such an extension of Christianity in the face of stripes, imprisonment, and death, speaks strongly for the missionary zeal of those early times. During the 2d and 3d centuries we find that missionaries have been successful in Gaul, southern Germany, Arabia, and
Missions.

Ethiopia. Early in the 4th c. Constantine, constrained by the prevalence of Christianity among all classes of his people, immediately subsequent to the terrible persecution by Diocletian, published, A.D. 312, his edict of toleration throughout the Roman empire. There is evidence that the Nestorians began in the 4th c. and for a thousand years carried on missions in central and eastern Asia. But no missions were more successful in these early times than those from Ireland to continental Europe in the 5th and 6th centuries. In the 5th c., the gospel was preached in Ireland by Patrick, who had been carried as a captive by pirates, and carried to Ireland as a slave, felt impelled, after escaping the second time to return to the land of his bondage, and make known there the gospel. He preached with such power that the island became nominally Christian before his death. Born in France, or in Scotland, he was ordained in France; he seems to have had no close attachment to the Roman church; and his successors long resisted the efforts of the pope to bring them under control. He established schools for educating the people in the gospel, and for training a native ministry and missionaries. At his death there were in Ireland many of these institutions, from which missionaries went forth in the 6th and 7th centuries to evangelize the barbarians of central Europe. Here also they established many schools, one of which was at Erfurt, where Luther studied centuries later. Columbus went in the 6th c. from the institution of Bangor, Ireland (sometimes confounded with Bangor in Wales), with 12 associates, founded the celebrated school in Iona, which attained a high reputation for biblical studies, and from which missionaries went to the northern and southern Picts of Scotland, to the eastern coast of England, and to the European continent. Columbusus from the same institution took 12 young men, and carried the gospel to the Burgundians, Franks, Swiss, and Italians; also to the Bavarians and other Germanic nations. His pupil Gallus, also an Irishman, was the apostle of Switzerland. Neander says that when Columbusus entered Germany at the close of the 7th c. it was almost wholly heathen, but before 729 the gospel had been proclaimed by himself and his countrymen, and "all the German tribes were obedient to the faith as taught by the Irish missionaries." "Their teachings," as shown by Ebrard, "consisted in reading the Scriptures in the original text, translating them wherever they went, expounding them to the congregations, and recommending their diligent perusal. These were their only rule of faith." These missions and institutions were in the 8th c. and even by the 9th century, and in the 10th c. the Irish clergy were subjected to its sway, Ireland, Christianized in the 10th c., sent out missionaries in the exploring ships of the Norsemen, and is believed to have carried the first knowledge of Christ to the Greenlanders in the 13th century.

Returning to the Roman empire we find that the cessation of persecution, though just and beneficent, opened the way for evils which hitherto had lacked opportunity of development. The state having become reconciled to the church, the church in turn became reconciled to the state, caught its spirit and imitated its modes. Christ had said to his disciples, "The princes of the Gentiles exercise authority, but it shall not be so among you." The church lost sight of this, and pastors, who had hitherto served the flock, and won honor by their service, began to change the crook into the rod. Not at once, or rapidly, but gradually the spirit of domination grew. Those who gained power sought to extend it by increasing the number of nominal converts, and proselytism rather than illumination became the mark of the first three centuries. Augustine with 40 monks to effect the conversion of the Anglo-Saxons. The Irish missions from the school of Iona had already introduced the gospel along the eastern shores of England. Ethelbert, king of Kent, had married a Christian princess, and yielding to the eloquence of Augustine, or the persuasions of his wife, was baptized. Many of his subjects followed his example, 10,000 being received into the church on one occasion. Augustine was made archbishop, and claimed to govern the older Christian churches, as well as his own converts. Those churches indignantly objected, saying, "We are all prepared to hearken to the pope of Rome and to every pious Christian, so as to manifest to all perfect charity. What other duty we owe to him whom you call pope, we do not know." The influence of Augustine with the Saxon kings, however, gave him the advantage in the contest, and before the Norman invasion few ventured to dissent from the Roman forms of worship. In 718 Gregory II. sent Boniface to Germany, not so much to convert heathen as to bring over to the Roman see the churches which had received the gospel through missionaries from Ireland, Burgundy, and Byzantium. Thenceforward the secular arm was often used for the extension of the faith, and where power was lacking for coercion, resort was often had to other measures which were at utter variance with the spirit of Christianity.

Before the close of the 14th c. not only was nearly all of Europe nominally Christian, but Mongolia, Tartary, Persia, and China had been visited and greatly influenced by bishops and friars sent out from the Roman Catholic church. The discovery of America in 1492 and the doubting of the cape of Good Hope opened the way for missions in new fields. The Spanish and Portuguese prosecuted their voyages of discovery, of traffic, or of conquest, taking with them missionaries authorized to effect the conversion of the natives. Mexico, Central and South America, and parts of India were among the countries thus visited. The institution, in 1530, of the order of Jesuits, who pledged themselves to go wherever the pope might send them, gave a great impulsion to missions among
the heathen. In Brazil, Peru, and New Granada, Jesuits, Franciscans, Dominicans, and Augustinians vied with each other in civilizing the wild tribes. In Mexico and California, as well as in the Portuguese possessions in India, the Jesuits were equally diligent. The Inquisition was resorted to not only to restore heretics but to enforce conversion.

It has been common for the Roman Catholic church to shield itself from blame in this respect by saying that it gave over the incorrigible to the secular authorities for punishment; but it is well understood that the secular authorities were under the control and did the bidding of the church. It is believed that in these days the church of Christ is learning again the spirit of Christ, and that persecution, formerly not unknown in any sect of the church, will hereafter be left to heathen powers.

In 1608 the French established prosperous missions among the Indians of North America. In the 16th, 17th, and 18th centuries unsuccessful attempts were made to bring into the Roman Catholic church the Christian church of Abyssinia, which for more than 3000 years had maintained an independent existence. At last, in 1859, the king of Tigre in Abyssinia, with 50,000 of his subjects, united with the church of Rome. The symphony of Franciscan missions in China, Aman, India, in Sene-gambia, Natal, and among the Galhas in Central Africa, in some of the islands in Polynesia, and among the Indians of North America.

In beginning an account of Protestant missions it is proper to allude to the sending of 14 pastors from Geneva by Calvin in 1555, at the request of Nicholas Durand, to join the colony of French Protestants whom he had persuaded to accompany him to Brazil. Durand joined the church of Rome, put to death three of the Genevan teachers, and drove others back to Europe, the Portuguese massacring the remaining colonists. In 1559 Gustavus Vasa of Sweden established a mission among his subjects in Lapland, which was maintained for some years. The Protestant settlers of New England, according to their own account, for one of their aims in coming to this country, "above all, that of extending the Redeemer's kingdom in lands where Christ is not named." The charter granted to the Plymouth colony by the king recognizes this "worthy disposi-
tion of religion" and that of God, "for the good of mankind, for the conversion of the world," and as the "conversion of savages" to "civil society and the Christian religion." In 1621 elder Robert Cushman, writing to England, reports the Indians as favorably disposed to religion and humanity, and some of the natives giving evidence, living and dying, of conversion to God. The charter given by Charles I. in 1628 to the Massa-chusetts colony declares that "to win the natives of that country to the knowledge and obedience of the only true God and Savior of mankind and the Christian faith, in our royal intention and the adventurers' free profession, is the principal end of the planta-
tion." The seal of the colony had as its device the figure of an Indian with a label in his mouth, on which was inscribed the Macedonian cry, "Come over and help us!"

This object was kept in view, though the settlers were harassed by the hardships and struggles incident to their condition, and, as circumstances allowed, carried out in the lives of those first settlers, and it bore fruit in the Christian walk of converts. In 1643 Thomas Mayhew began labors among the Indians of Martha's Vineyard and Nantucket, and five generations of that family furnished pastors for the churches so gathered. In 1646 the Reverend John Eliot, succeeded an M.S. in the propagation of the gospel among the Indians, and the same year the celebrated John Eliot began to labor among them. In 1649 the society for propagating the gospel in New England was formed in England, which aided in the support of Eliot, Mayhew, Bourn, and other missionaries among the Indians. A settlement of praying Indians was soon formed, and a church organized in Natiek in 1661. Eliot traveled extensively among the Indians, and once preached the gospel to the famous king Philip of Pokanoket, who rejected it with disdain. He translated the Bible and other Christian books. His translation published in 1663 was the only Bible printed in America before the revolution. In 1675, through the labors of Eliot and others, 14 settlements of praying Indians had been formed, and 24 regular congregations, and there were as many Indian preachers. The converts adopted civil and Christian modes of life, and became industrious and virtuous citizens. In 1739-45 Mr. Parks labored among the Indians of Rhode Island. They abandoned their dwellings and scattered places and have taken possession of the land for their own church, in 1734 Mr. J. Sargent, resigning the office of tutor in Yale college, labored with the Mohicans till his death in 1749. He found them "living viciously in miserable wigwams; he left them settled in a thriving town at Stockbridge with good houses." The great and good Jonathan Edwards labored 6 years among them. From 1734 to 1782 the Moravians labored with great patience and self-denial for the Indians in various parts of Pennsylvania, New York, and Connecticut. Of these missionaries count Zinzendorf, Christian Henry Rauch, and David Ziesberger are worthy of special notice. Many converts were made. From 1743-47 David Brainerd lived a martyr-life among them, teaching and converting many. The Rev. William Tennent, also John Brainerd, and a converted Indian, Samson Occom, and many others worked earnestly and successfully. The French and English war came, and the war of the revolution. The Christian Indians took no part in these, and were consequently suspected by each party of secretly sympathizing with their enemies. They suffered much from the belligerents, their settlements being broken up, their villages and farms destroyed. Reports of the work among the Indians excited great interest in England, and funds continued to be raised.
Missions.

for its advancement. Dr. Luesden informed Cotton Mather that the example of New England awakened the Dutch to seek to convert the heathen in their East Indian possessions. Referring to it, bishop Burnet says: "The church of England, moved by the example of the dissenters, whose labors they admired, formed the society for promoting Christian knowledge." Some members of this society in 1701 formed the society for the propagation of the gospel in foreign parts, which was sanctioned by William III. It began mission work in India in 1727, and has had missions in Delhi, Poona, Ahmednuggur, Kolapole, the Nizam's dominions, Bangalore, Cuddalore, Tinnevely, Arcot, Madras, Madura, and Calcutta. The mission of this society in Tinnevely district has had great success in recent years, 23,654, from July, 1857, to the end of June, 1879, having asked Christian instruction. In 1879 this society had 585 ordained missionaries, 578 native catechists, 212,051 baptized persons, 4,143 communicants.

In 1705 Frederick IV., king of Denmark, sent Ziegenbalg and the Hentschel to Tranquebar, on the Coromandel coast, to convert his heathen subjects. So averse were the natives to having foreigners acquire their written language that the king put their teacher in prison, and loaded him with chains. Ziegenbalg himself was imprisoned four months. Persuading amid great discouragements the convert at his death numbered 555. In 1711 the translation of the New Testament into Tamil was finished. Grundler, Schultzze, and Dahl continued the work after Ziegenbalg's death; and the rajah of Tanjore, who had forbidden Ziegenbalg to enter his territory, was so won by their constant lives that he threw open his kingdom to the gospel. The work was, however, retarded by the wars between the English and French. It seems as if the English and French judged themselves in every point superior to the Hindus and Mohammedans against Christianity. In 1728 Schultzze removed to Madras and formed the Vepery mission. In 1750 Christian Frederick Schwartz arrived in India. He labored 48 years at Tranquebar, Trichonopoly, Tanjore, and in Ceylon. During 10 years in Trichonopoly he baptized 1238. The simplicity and earnestness of his life won the confidence and respect of heathen and Mohammedan princes. The English government sent him to negotiate a treaty with the haughty and powerful Hyder Ali. Hyder had said: "Let them send me the Christian; he will not deceive me." When near death the rajah of Tanjore committed to his guardianship his adopted son and heir, Serfozee. Serfozee, when klug, erected a monumental slab to the memory of Schwartz in the church where he had been wont to preach, in which groups of children and native men, and Serfozee himself, are represented as mourning his death, while he is depicted as looking at the cross.

In 1708 a Danish mission was sent to Greenland. In 1709 the Society for promoting Christian knowledge was formed in Scotland, and by it David Brainerd was sustained among the Indians. Through the influence of Hans Egide, Frederick IV., of Denmark, established a seminary at Copenhagen to train missionaries for Greenland. It was here that count Zinzendorf was first impressed with the duty of spreading the gospel, and when he returned to Hennhut the Moravians seemed at once inspired with a wonderful zeal in the cause of missions. They looked upon it as the great business of the church, and claimed that every member should contribute to its support. One in 50 of the entire membership devoted themselves to labor in the foreign field. From 1732 to 1853 they had stations in the West Indies, Greenland, among North American Indians, and in Labrador, South America, Australia, and Thibet; and the whole number of missionaries engaged during those years was 2,500, exclusive of native assistants. In 1879 they reported 90 stations, 321 missionaries, 1485 native helpers, 24,439 communicants, 13,856 baptized adults, and an aggregate membership of 201,815.

In 1789 William Carey, a Baptist minister, endeavored to reawaken in England an interest in the subject of missions to the heathen, but it was not till 1792 that a society was formed, which sent Carey and Thomas to Calcutta. The East India company forbidding their going in the company's ship, they left it and went in a Danish vessel. Obliged for a time to support themselves by superintending an indigo factory, they preached and taught among the native employees and in the neighboring villages. Marshman and Ward also were sent, but, owing to the hostility of the company, were obliged to proceed to the Danish settlement at Scumphore, where the Danish governor, who had previously enjoyed the ministry of Schwartz at Tranquebar, gave them and Carey also his protection. In 1816, 700 natives had been baptized, and 10,000 children had received Christian instruction. The same society in 1797 established a mission in Singapore, another in 1804 in the Jessore district; also in Chittagong; in Dacca, in Bengal (where in 1873 there were 4,600 converts and 40 native teachers and preachers), in Agra, Allahabad, Benares, and Delhi. In the mutiny of 1857 two missionaries and their families at Delhi were massacred, but after the siege the mission was renewed, and made great progress. The society sent missionaries to the West Indies and Africa. The missions in Jamaica have become self-supporting since 1842. It has missions also in Norway, Italy, and China, and reported, in 1878, 86 European missionaries, 40 native missionaries, 265 evangelists, 112 stations, 29,496 church members, 348 teachers, 15,079 scholars, and an income of $230,344. The General Baptists formed a distinct society, sent a mission to Orissa, India, in 1822; and in 1878 had 7 stations and 5 branch stations, 14 European agents, 15 native preachers, 884 members, and an income of $42,000. They have now begun a mission in Rome.
The London missionary society was formed in 1795. Their mission in the Society islands, established 1797, was without apparent success until, in 1816, king Pomare II. embraced Christianity. In 25 years the islanders had relinquished idolatry and cannibalism, had learned to read, had made great improvement in social habits, and many of them lived the Christian life. French Catholic priests reached the islands, but were not allowed to remain. The islands were soon after this seized by the French government in the interest of the Roman Catholic missionaries. In 1867 this society sent Dr. Morris- son, the first Protestant missionary, to China, who translated the New Testament and, with the aid of Dr. Milne, the Old Testament into Chinese. It established missions also in the Indian archipelago, in Mauritius, in Southern Africa, where Moffat for 53 years with great success taught Christianity and civilization, beginning in the kraal of Africander and extending his labors to several native tribes, and where Livingstone began his unprecedented career as a missionary and explorer. Their missionaries sent in 1829 to Madagascar were the instruments of introducing Christianity there. They were expelled for a time, but the "praying ones," as the converts were called, continued to increase during their absence, notwithstanding a terrific persecution in which the queen is said to have slaughtered as many as 2,000 of her best subjects in a single year on account of their adhesion to Christ. After her death the missionaries were invited to return, and religious liberty was enjoyed. Half a million of people have renounced idolatry, and 60,000 have confessed Christ. In 1880 this great society had 136 ordained European missionaries, 371 ordained native ministers, 4,529 native preachers, 89,487 communicants, 439,585 native adherents, 75,914 pupils. Its missions are in China, India, Madagascar, Africa, the West Indies, and Polynesia.

The Church missionary society was formed in 1799. Finding none in England to engage in the work, they for a time employed Germans. William Wilberforce was one of its warm supporters, and its first mission was naturally to the west coast of Africa. It had to struggle against the intrigues of the slave-traders and a most unpropitious climate, but after the transfer of the colony to the government of England the Sierra Leone mission became stable and successful. Their mission in the Timnevelly district has received great accessions within two or three years, 11,000 heathen having sought instruction preparatory to baptism in 1878. The society had in 1878, 181 stations, 203 European ordained missionaries, 11 East Indian, 170 native, do., 2,138 native assistants, 497 female assistants, 27,080 communicants, 123,724 Christians baptized, 1490 schools, 57,145 scholars. It has a missionary institution at Islington.

The Wesleyan Methodists engaged in mission work as early as 1786, when Dr. Thomas had in 1786, when Dr. Thomas began a mission in Ceylon, which afterwards extended its labors to the continent. There was no regularly organized Wesleyan missionary society until 1817. It has since carried on missions in Spain, Portugal, Africa, India, China, Australia, in the Fiji island, where "cannibalism, war, and murder ceased wherever they penetrated," and in the Friendly islands, where the once hostile tribes are united under the native convert George, who is Christian preacher as well as king, and among the negroes of the West Indies, where they have been very successful. This society has 429 stations, 457 missionaries and assistant missionaries, 9,892 catechists, local preachers, and teachers, 83,770 full church-members, 92,924 scholars.

The church of Scotland formed a missionary society in 1824, and began its work in 1829 by sending Dr. Duff to Ceylon, who, with his schools made a powerful impression on the native young men of that city. At the disruption of the Scotch church its missionaries joined the Free church. The State church of Scotland has missions at Cuttack, Madras, Secohate, Darjeeling, and Bombay, with an income of $51,000. The Free church of Scotland has missions in India, South Africa, Australia, and Syria, and among the Jews at different points, their school in Constantinople having 200 pupils. It has 45 Europeans and 195 natives employed in mission work, 2,163 communicants, 11,086 pupils, and an income of nearly $100,000. The United Presbyterians of Scotland have 48 missionaries and 8 medical missionaries in the West Indies, Spain, Old Calabar, South Africa, India, and China; 6,927 communicants, and an income of $190,000. The Presbyterian church of Ireland had in 1879, 8 missionaries, 11 native evangelists, 296 communicants, 1082 baptized natives, and an income of $72,755. Many other societies in Great Britain, local or limited in sphere, do very useful work.

The missionary interest in the United States during the 17th and 18th centuries had been expended in efforts to Christianize the Indians, and evangelize its own wide newly-settled regions. In looking for the origin of the foreign missionary work in America we find three young men in Williams college withdrawing out a summer afternoon in 1807 to a retired field, telling each other their impressions concerning the condition of the pagan nations, and kneeling there to implore divine direction as to their duty. They converse privately with ministers on the subject, sometimes venturing to allude to it in a prayer-meeting. In 1810 they with others unite in an appeal to their "revered fathers" of the general association (Congregational) at Bradford, Mass., who, recognizing their impressions as a "divine intimation of something great and good in relation to the propagation of the gospel," proceeded to constitute the American board of commission-
ers for foreign missions. Its first missionaries to foreign lands were Newell, Judson, Hall, Nott, and Rice; all of whom were, on their arrival at Calcutta, ordered by the East India company to return in the vessels which brought them. Judson and Rice having on shipboard changed their views in regard to baptism, united with the Baptists and left the American board. Hall and Nott went to Bombay, and were ordered to return, but after much discussion and negotiation with the East India company and the home government were allowed to remain. Thereafter India was open to American missionaries. Newell on being sent from Calcutta went with his wife to the Isle of France, where she died. He went ultimately to Bombay. In the East Indian field the American board has since conducted with success missions in Ceylon, Ahmadnagar, Madras, and Madura. In 1817 the Rev. Cyrus Kingsbury commenced labor among the Cherokees. The work was extended to the Chactoars, Chickasaws, Creeks, Seminoles, Dakotas, Sioux, Ojibwas, Ottowas, Iroquois, Cayugas, Walla-Wallas, and Néz Percé. Between 1817 and 1860 the American board expended among the Indians $1,100,000, and the laborers employed were more than 500. Other societies have done much. The work has been greatly thwarted by successive removals of the tribes, the sale among them by government agents of intoxicating liquor, and prejudice awakened by the fraudulent dealings of white men. Yet some of these tribes are recognized as civilized communities, and compare favorably with the white people about them. Ten thousand of the Indians are members of Christian churches, and 75,000, including women and children, conform to the customs of civilized life. In some instances, while Christians were turning their thoughts towards foreign lands, events in those lands were preparing the people for the coming of missionaries. Vancouver in his four visits to the Sandwich islands had given the people some thoughts on the folly of idolatry, and had told them that next event would come to them, and that event was the American board. Haima I. was so far influenced that in his last sickness he forbade the customary offering of human sacrifices. Reports reached the people of the cessation of idolatry in the Society islands and of the great improvement in the condition of those islanders. Five Sandwich Islands youths who had gone with American shipmasters to America were receiving a Christian education, and one of them had written to his father describing the advantages of the Christian religion. The people also had become under the restrictions of the taboo system, and had noticed that foreigners incurred no risk by their non-observance. The mother of the new king Liholii first broke taboo, and many of the chiefs, and at length the king, did so also, and afterwards destroyed the idols. It was the presence of the Sandwich Islands youths in America that induced the American board to send a mission to those islands; and in 1829, when the people were breaking taboo and burning idols, the missionaries, wholly uninformed of these events, went about their way from Boston. They found a nation open to instruction. The details of the work among them are of remarkable interest, and those islands are now, in the usual sense of that term, a Christian people. There are now 12,360 members in 57 churches, most of them having native pastors,—in 1829 the American board began mission work in Turkey, sending Parsons and Fisk to Smyrna. In 1831 Goodall, having carried an Armeno-Turkish translation through the press at Malta, reached Constantinople. A succession of able laborers, male and female, have continued the work to the present time through numerous cities and villages of both European and Asiatic Turkey. In 1827 the Maronite patriarch, in his decree of excommunication against the missionaries, by which the people were forbidden to deal with them in any way, stated that "they are unwearied in their efforts; that "they go about, manifesting a zeal in compassionate their neighbors;" that "they have opened schools and supplied instructors, all at their own expense;" that "in their outward works they appear as men of piety;" and that "the evil grows day by day." This truly, though inadequately, describes the work and the workmen for 60 years past; and though there has been much persecution, the results are equal to the work. Christopher R. Robert, a merchant of New York, erected a college in Constantinople and left property to sustain it. It has 250 students, of 13 nationalities. The native converts of Aintab have contributed largely towards founding a college which is in operation in that city. There are four theological seminaries in Marsovan, Kharpnt, Marash, and Mardin. Though the work has been directed chiefly towards the regeneration of various lapsed Christian sects, yet there is abundant evidence that indirectly thousands of Mohammedans have been convinced that there is a Christianity, which makes man kind and true, though it would be death to them to adhere publicly to it. They listen often to Christian preaching, their children attend the schools, and individually they sometimes show great enlightenment; but very few Mohammedans have dared to take a stand on the side of Christ. It is the view of the missionaries to "therefore knead the dough of conscience, to incite secular truth, to induce them to leave forms and ceremonies, however vain and hurtful, to be disposed of by the people themselves when they should become Christians at heart." The trials and exposures undergone in caring for the sick and wounded during the recent Russo-Turkish war, and in distributing to the hungry in the famine, made a deep impression on the people. Throughout the Turkish empire, "despite oppression, misrule, and anarchy," says the last annual report of the American board, "the heaven of the gospel is doing its work." Of the agencies involved we may note the existence of 93 churches, with 6,500 members; nearly 500 pastors, preachers, and teachers; 30 colleges, seminaries, and high schools.
attended by 1,500 youth of both sexes in nearly equal numbers; 300 common schools, with over 9,000 pupils; and an educational and religious literature amounting in the past year to 13,000,000 pages.—In 1830 the Rev. Jonas King entered the service of the American board as its missionary in Greece. He was already on the ground, having been sent by the ladies' Greek committee of New York with relief for the suffering in the struggle for independence. Dr. King preached the gospel in the parlor, in the street, in the school-room. He endeavored, through the teachings of the ancient Christian fathers, whom they revered, to lead the Greeks back to the simple truth of the gospel. He greatly improved the condition of the schools, translating school-books and providing states and other aids, of which they had been destitute. His work was appreciated by parents and children, and in most cases by the government, but he was repeatedly brought to trial by the ecclesiastics, and often was in peril of his life. He, however, gained religious toleration for Greece. He was joined by the Rev. Elias Riggis in 1833. In Nov., 1835, Rev. Justin Perkins and Dr. Grant, with their wives, reached Oronoinah for the purpose of laboring among the Nestorians of Persia. They were well received, bishops, priests, and deacons attending their schools, and inviting the missionaries to preach in their churches. Dr. Grant acquired great fame by his surgical skill, especially by successful operation for cataract, and gained access to wild mountain regions among Koords, where Christian travelers probably never had gone before. There are now 1,152 members in the reformed Nestorian church, 18 ordained native pastors, 45 preachers, and 90 teachers and other helpers. The mission to West Africa was commenced in 1827, with a colored missionary, Mr. D. Russell, as its founder. He had previously been a soldier of the American legion in that year, and from the first was undisturbed and effective. That to the Zulus in South Africa was begun in 1836. It met with many interruptions from sickness, death, and war. Its 15 native churches have had much to contend with, and some relapses into old customs are reported. Yet a good degree of desire is shown to make the gospel known to their heathen neighbors. In Feb., 1830, the Rev. Elijah C. Bridgegaman, missionary of the American board, reached Macao, to establish a mission in China, and in 1834 was joined by Dr. Peter Parker. In 1835 Dr. Parker established an eye infirmary, which was supported wholly by foreign residents. With the exception of a few pupils under Dr. Bridgegaman's instruction, it afforded for a time, through conversation and books, the only opportunity of making known religious truth. He had soon three Chinese students in medicine and surgery under instruction, and a hospital under his care sufficient for 150 patients. In four years he had treated 6,450 cases. This institution was favorably viewed by all, and approved by the missionaries. Christian truth was dispensed. The treaty of China with the United States in 1851, known as the Tientsin treaty, stipulated "that the principles of the Christian religion are recognized as teaching men to do good, to do to others as they would have others do to them; any person, either citizen of the United States or Chinese convert, who, according to these tenets, peacefully teaches and practices the principles of Christianity, shall in no case be interfered with or molested." Thenceforth mission work was much extended in China. The American board has two great mission centers in China, the Foochow mission and the North China mission. It has 17 missionaries, 3 medical missionaries, 28 female assistants, and 25 churches. Of the missionaries of different names who traveled through the famine-stricken district in N. E. China, bearing food to the hungry, five fell victims to their over-exertions. This self-sacrifice revealed the Christians, whom the Chinese had been taught from childhood to despise, in favorable contrast with their own mandarins. The Chinese people have been permitted to have a temple to their own gods, and, after destroying the idols, to present to the missionaries a deed transferring the temple legally and perpetually as a place of Christian worship.

The China Inland mission. Mr. J. Hudson Taylor having been for several years in China, returned to England impressed with the immensity of the Chinese population, their deep spiritual needs, and the utter insufficiency of existing agencies for their evangelization. He sought without interfering with other enterprises to devise some way by which more could be accomplished. The Chinese inland mission was inaugurated by the sending of Mr. James Meadows from England to China in 1862. The principle adopted was that the missionary should go out without guaranteed support, trusting in God for what he might send. Mr. Meadows was followed by several others, and in May, 1866, by Mr. Taylor himself, taking his wife and four children, and accompanied by a party of thirteen new missionaries, "means having come unsolicited sufficient to meet the heavy expenses involved." They reached Chekiang, a free port on the coast of Yung-tea, Kiang, in May, 1868, but were driven away by a mob, and their defeat became the "laugh of tea-house and restaurant." They removed to Yang Chau, a city of 300,000 people, reaching there June 1, and after a few weeks the whole party were being burned alive in their own hired house by an infuriated mob, instigated by the literary class. Yet they were wonderfully preserved, notwithstanding the authorities of the town failed to succor them, and a few months later were in quiet possession of their premises in Yang Chau, "mobs and mandarins having found that they were ruled by principles more potent than the fear of mobs." These missionaries, accompanied by native helpers, and preaching and distributing Scriptures and tracts, have traversed 30,000 miles through new provinces. They number now 600 church members, occupying 60 stations, and have about 90
native laborers engaged as colporteurs, evangelists, pastors, and Bible-readers. For the past 14 years the work was performed by unsalaried officers, but as correspondence became heavy, in 1875 one salaried assistant secretary was employed, and in 1876 another. In July, 1837, Mr. King, of the house of Oliphant & Co., American merchants in Canton, accompanied by his wife and by Dr. Parker and Mr. Williams of the American mission, and taking with him 7 ship-wrecked Japanese sailors, whom he wished to restore to their country, sailed for Yokohama. Approaching the town they were fired upon by the Japanese and obliged to retreat. The same reception met them at another port, and they relinquished for that time the attempt to open intercourse with Japan.

The commercial treaties of 1854 and 1858 between Japan and England and America having prepared the way, and other societies of America, England, and Scotland having already entered some parts of Japan, the American board sent missionaries in 1869 to that field, and has now in and around Osaka, Kioto, Kobe, and Yokohama, 4 principal and 14 out-stations, 16 churches, 12 of them self-supporting, with 500 communicants. Twelve missionaries, 3 physicians, 39 female missionaries, 8 native pastors, 18 evangelists, 14 teachers, and 7 Bible-women are at work. A native missionary society is formed, and is very useful, and the native Bible-women do much good among the native women. The American board in 1880 had 17 missions, 55 stations, 642 out-stations, 156 American ordained missionaries, 6 physicians unordained, 254 American assistants, male and female, 138 native pastors, 327 native preachers and catechists, 750 school teachers, 222 native helpers, 273 churches, 16,992 church members, 1185 pupils in training and theological schools, 1356 girls in boarding schools, 1066 other adults under instruction, 27,056 pupils in common schools. The whole number of pupils is 30,693. The board has 66 seminaries and colleges.

In 1858 the Reformed church, which till that time had co-operated with the American board, organized for itself the board of foreign missions of the Reformed church in America. It has very successful missions in China, India, and Japan; and in 1880 had 14 stations, 101 out-stations, 16 ordained American missionaries, 21 assistant American missionaries; 49 native ministers and catechists, 1719 pupils in day schools, 12 theological students, 2,941 communicants.

The American Baptist missionary union was formed in 1814, and at once assumed the support of Dr. Judson, who had been laboring in Rangoon, Burma, since July, 1813. He early not only proclaimed the gospel by word, but the missionaries were inhumanly treated; but Dr. Judson was spared to do a great work among the Burmese and Karens, and Mr. and Mrs. Wade and many other earnest laborers have continued the mission with great success. The mission to the Telugus, begun in 1836, for many years alternated between success and failure, and again and again its relinquishment was proposed. In 1867 a remarkable work of prosperity commenced. The first church of Christ was organized by rev. Mr. Clough with 8 members, and in 8 years the number increased to 3,300. In 1876 came famine and afterward cholera, and again famine, terrible, widespread, and long continued. The missionaries were made almothers of the government, and thus gained access to many hundreds of persons, to whom they spoke of Christ. In 1878, within a few months, 3,147 were baptised.—The mission to Siam was begun in Bangkok in 1833. In 1877 there were 6 churches, 415 members (mostly Chinese), 7 chapels, 2 ordained and 6 unordained native preachers. The Siamese government has not only proclaimed the gospel by word, but by deeds, and the government shall compel any Christian to do acts contrary to his religion, as worshiping spirits, feasting holidays, laboring on Sundays, only excepting the case of war and public business of importance. The Baptist union has missions in Greece, Africa, Arracan, Assam, China, and Japan, besides some countries of Europe. It had in 1880 30 stations, 102 American missionaries, 616 native preachers, 475 churches, 40,087 church members. Income, $314,800.

The Methodist Episcopal missionary society was formed in 1819. It has successful missions in India, China, Japan, Africa, Bulagaria, Mexico, South America, and some countries of Europe. It had in 1880 97 American ordained missionaries, 63 female American missionaries, 133 native ordained preachers, 185 native unordained preachers, 197 local preachers, 390 teachers, 10,283 day scholars, 26,702 church members.

The Protestant Episcopal missionary society was organized in 1829. For some reason a mission was not established till 1830, when the revs. J. J. Robertson and J. W. Hill, and Mr. Bingham, a printer, were sent to Greece. It has now missions in Greece, Western Africa, China, Japan, Hayti, and Mexico. In 1880 it had 141 stations, 5 American and 2 native bishops, 43 American and native priests and deacons, 4 physicians, 24 foreign lay workers, 164 native helpers, 2,500 pupils in boarding and day schools, 4,549 communicants.

The Presbyterians had since 1741 done missionary work, mostly among the Indians, under different organizations, which in 1831 were merged in the board of foreign missions of the Presbyterian church. Its first mission was to Liberia, where unusual obstacles presented themselves in climate and the character of the people. It is still continued; also the missions at Gaboon and Corisco. In 1833 the rev. Messrs. Reid and Lowrie were sent to Lodiama, in the far interior of India. Sickness and death weakened the mission, but it was reinforced, and useful native laborers have been raised up. That mission has now 10 stations. Their mission to Furruckabad, where Freeman and
Campbell, with their wives, were murdered in the Sepoy rebellion, was commenced in 1828, and has 7 stations. The Kolapore mission, which was begun as independent by the rev. R. G. Wilds, and has passed into their hands, has 3 stations. The converts—Mohammedans, Sikhs, and Hindus—have in some instances suffered great privations and persecutions. On occasion of the reuniting of the Old School and New School general assemblies, the Presbyterian board received an accession to its membership of the New School members of the American board (thus left entirely to the Congregational churches, and at the same time, in amicable transfers, the missions of that board in Syria, Persia, West Africa, and among the Seneca Indians of New York. Those missions have since been rejoined by the Presbyterian board. It has missions also in Siam, China, Japan, Brazil, Chili, the United States of Columbia, among the Indian tribes, and the Chinese of this country. In 1880 it had: ordained American missionaries, 125; ordained native missionaries, 83; licensed native missionaries, 147; American lay missionaries, male and female, 280; native lay missionaries, 516; communicants, 1,697; pupils in boarding and day schools, 17,791.

The Evangelical Lutherns began foreign missions in 1841. They have missions in India and Africa, with 5 ordained European missionaries, 2 ordained native missionaries, 42 native assistants, 250 communicants, 5,992 baptized converts, and 950 scholars. The Seventh-Day Baptists began in 1842, and have small missions in West Africa and China. The Baptist church, South, began mission work in 1843, and has missions among the American Indians, and in Italy, Africa, and China. The United Presbyterians church, from its organization in America in 1858, has had missions in Syria, Egypt, India, and China. It had in 1880 23 stations, 13 foreign ordained missionaries, 8 native ministers, 12 teachers, 31 churches, 1318 communicants, 6,762 scholars. The Presbyterian church, South, sent out 104 missionaries, 35 native missionaries, 50 native laborers, 1400 communicants, 494 pupils, and an income of 48,485.

At the period when the subject of slavery was kindling intense feeling and heated discussion throughout the United States, some of the missionary societies sought to avoid being involved in those controversies as foreign to their objects, while some friends of the cause thought it impossible to maintain neutral ground. This led to separate organization. The Free Baptist missionary society was formed in 1843, sending a mission to Hayti, and the American missionary association in 1845. The Union missionary, the committee for the West India mission, and the Western Evangelical missionary association, joined the American missionary association, taking with them their missions in West Africa, in the West Indies, and among the North American Indians. This society, now mainly in the hands of the Congregational churches, has operated in Siam, the Hawaiian islands, and also among the Chinese of California. The work in the Mendel mission and among the Chinese has been very successful. Since the slave were emancipated, it has been chiefly occupied with a great work among the freedmen of the former slave and border states. It had in 1880 93 missionaries, 213 teachers, 76 churches, 5,084 church members, 71 schools, 10,092 pupils.

The American and foreign Christian union resulted from the union in 1849 of the Foreign Evangelical, American Protestant, and Philo-Italian societies. It has labored in Italy, Belgium, Sweden, Canada, Hayti, South America, and Mexico, and five years after its organization numbered 140 missionaries, half of whom were ordained. Denomination societies having become interested in the work, the union has transferred much of its work to them, and turned its attention more to our own country. It is still aiding the work of foreign evangelization, especially in France and Spain. In 1815 a seminary for the training of missionaries was founded at Basel, and in 1821 the evangelical missionary society was formed there, which employs in Africa, India, and China 96 European missionaries, 59 female missionaries, and 210 native laborers, and has 5,718 communicants. In France, since 1829, has had a missionary society, with a mission among the Basutos of s. Africa, which has occupied 17 stations, has 69 native helpers, and 2,000 communicants. In 1824 the Berlin missionary society was formed, and has a mission in southern Africa with 31 stations and 45 laborers. The Rhenish missionary society, founded in 1823, has 16 stations in s. Africa, with 11,300 converts; also among the Bataas in Sumatra, 11 stations with 3,500 converts. In 1836 the evangelical Lutheran missionary association of Leipsie was founded, and has in India 17 European missionaries, 16 stations. In 1854 the Hermansberg society was organized, which has sent out entire colonies of missionaries. There is also Gossner's mission union, founded in 1836 by Papa Gossner, as he was called, at 70 years of age, largely with his own resources. His most interesting station is in and near Ghaou Nagpoore, among the Kohls. The first convert was baptized in 1850, and in 1857 there were 890 converts. In the Sepoy rebellion they were hunted from their homes, their chapels were unroofed, and a price set on their heads. A few years later they turned the magnificent buildings erected by the British, and the little that remained was destroyed. In 1866 numbered 3,400. In 1871 there were 20,720 native Christians, 105 native preachers, and 1297 scholars. The Friends' missionary society began their work by sending Rachel Metcalf to India in 1866. This mission has been reinforced, and has now 11 members and 4 native teachers and catechists. In 1867, in response to an appeal from Mr. Ellis of the London missionary society, they sent Mr. Sewell to Madagascar, where they had assigned to them one of the 9 churches of the metropolis, with the work in a district 70 m. long, 35 m. wide. They have now 108 congregations, 3,350 members,
The first woman's missionary society in America, of which we find record, is the Boston female society for missionary purposes, organized Oct. 9, 1800, which was a union of Congregationalists and Baptists. After this they became common in many parts of the country. All of these societies simply earned, collected, and transmitted money for the use of the general societies. As in the progress of missions it became evident that the hostility of heathen women was a great obstacle to success, and as in many heathen countries, especially in India, they were unapproachable by the usual missionary agencies, it was felt that more direct efforts that had not been made for their conversion, were necessary. Missionary women returned sold to Christian women the dark and hushed story of their sisters in India, and they longed to do more for them than had been done. It came to be believed by some that if women had the selection of their own agents, and the management of their own funds; if they originated their own methods, and arranged their own work, more would be accomplished than by the old methods. They at first desired to avail themselves of the acquired wisdom and experience of the older societies by some kind of co-operation, but their plans did not at that time meet with favor from existing boards. They therefore organized independently the woman's union missionary society. It was incorporated in New York in 1861. From the first it has been undeniational. Its higher officers have thus far performed their duties without remuneration. The number of missionaries employed since the formation of the society is 92; the number now in the field, 41; the present number of schools is 33; zemians taught, 43; pupils in 1880 were 2,630 and in 1881, 2,890. The largest annual collection was $33,607. Total receipts to May, 1879, $560,712. lady agents and missionaries. The woman's boards have since been formed as the woman's board of missions, Congregational, in 1868; ladies' board of missions, Presbyterian, 1868; woman's board of missions of the interior, Congregational, 1868; woman's foreign missionary society, Presbyterian, 1870; woman's foreign missionary society of the Methodists, Episcopal church, 1869; woman's Presbyterian board of missions of the northwest, 1870; Baptist ladies' missionary society, 1871; and many others. The total receipts of all such societies, as reported from the formation to 1880, reached about $8,000,000. It is impossible in the nature of the case to furnish statistics of results of this work. There is evidence, however, that it is useful and successful beyond anticipation, and that through it many women in India are receiving that enlightenment and blessing which ever follow the knowledge of the Lord Jesus Christ.

There are computed to be now 500,000 converts from heathenism in the world. The Protestant missionary societies of the world number 52. The missionaries in various fields supported by American Christians number 574. With very little exception, all the Protestant societies have carefully avoided interfering with each other's work, or entering each other's fields, and in many instances where their fields were adjacent there has been a delightful spirit of concord and mutual helpfulness.

Some striking facts connected with the progress of the gospel in the world may be mentioned here. A Christian lady of Calcutta, the wife of an English officer, had long desired to benefit the native women. It happened one day that a native of rank, a former pupil, visiting at the house, saw and greatly admired a pair of beautifully embroidered slippers which the lady had completed for her husband. The lady offered to teach his wife to do such work if she might go to her. She allowed him to take home the slipper and consult the mother-in-law. Permission was granted her to go and teach the wife not only to sew, but to read, and ultimately to read the Bible. This is the door through which has been introduced the whole system of female meetings in India. The missionary ladies heretofore excluded are now admitted to the private apartments of thousands of the women, and their instructions are bearing cheering fruit in many hearts. Before the first Protestant missionary went to China in 1807 it was thought impossible for a foreigner thoroughly to acquire the Chinese language. Nevertheless, not only has the Bible been translated into three Chinese dialects, but a variety of useful books, as dictionaries, geographies, books on medicine, jurisprudence, etc., have been so translated as to be acceptable to intelligent Chinese, and some have been reprinted by them. At Shanghai alone the mission press issues 18,000,000 pages annually. The interior of Africa had for hundreds of years foiled the attempts of the very mariners of science to penetrate it. Livingstone, fired with desire to open Africa to the gospel, and if possible to stop the fountains of the slave-trade, unlocked the regions so long closed. The results of his daring might have been partially or wholly lost had not Stanley follow him and brought in the legend of a native king willing to listen to the gospel. Now all Christendom is combining for the conversion of the central portions of the dark continent, and at least five societies have sent missionaries to different posts in that region. The formation of a society of intelligent Hindus, the Brahmo Somaj, who reject idolatry and assemble for the worship of a supreme being, indicates the working of the leaven of Christian truth. Its present leader, Kesub Chunder Sen, says of India. 'Native society is being roused, enlightened, reformed under the influence of Chris-
tianity." Sir Battle Frece, who spent 30 years in India, said, "The teaching of Christian among 100,000,000 of Hindus and Mohammedans is effecting extraordinary changes in India. The experience of a few more years will demonstrate the fact that the missionary enterprise is incomparably the most effective machinery that has ever been brought to operate upon the social, the civil, and the commercial interests of mankind."

The last 10 years have witnessed a greatly increased success in missionary work. Missions have often been declared a hopeless toil; but if the recent rate of advance be maintained, the time will be not so remote as one might think who gave the subject only thought, when the last heathen nation shall have heard the gospel.

MISSISSQUI, a co. in s. Quebec, having the state line of Vermont for its s. boundary, and the n. portion of lake Champlain, called Mississquoi bay, and the Richelieu river for its s.w. boundary; 500 sq.m.; pop. 16,922. It is traversed in the extreme e. by the Southeastern and Montreal railway, which in the extreme n. forms a junction with the Sianstred, Sheffield and Chambly, and the Chambly and Sorel railroads. The Central Vermont railroad crosses the extreme s.w. section on the shore of the lake. Its easternmost point is the capital, Chambly, the site is w. It is well watered with creeks and brooks; and beds of iron ore, brick-yards, and manufactories of various kinds. Capital, Freilighsburg.

MISSISSA'GAS, a tribe of Indians belonging to the Algonquin nation, who, when first known by the whites, lived n. of lake Huron on a head of Lake Ontario among the Hurons by the Iroquois, they moved to the region of lake Superior, but after a few years returned. Until the French and Indian war broke out they were constantly engaged in warfare with the Iroquois, and were driven eastward to the Thousand islands. At first friendly to the French, they were in 1746 gained over by the Six Nations, and for a time sided with the English; but in the second war, feeling themselves ill-treated by their white allies, again joined the French; when the Pontiac war began they once more assisted the English, but in the Miana war (1792) and in the war of 1812 showed themselves hostile to the Americans. For a short time they lived near the present site of Erie, but have long been settled in Canada, occupying four villages in Ontario. Missions were established among them as early as the latter part of the 17th c., but only within the last 50 years has Christianity made much progress among them. They are now, however, well advanced in religion and civilization, till the land, live in houses, and have schools. They number between 500 and 1000.

MISSISSIPPI, one of the south-western states, lies in lat. 30° 13' to 35° n., and long. 88° 7' to 91° 41' w. It is 332 m. from n. to s., and from 78 to 118 m. from e. to w., containing an area of 47,150 sq. miles. It is bounded n. by Tennessee, e. by Alabama and Florida, s. by Louisiana and Texas, and w. by the Gulf of Mexico. The state also includes a cluster of islands in the gulf, of which the principal are Horn, Deer, and Ship islands. There are 73 counties. The principal towns are Jackson (the capital), Natchez, Vicksburg, and Columbus. There are 89 m. of sea-coast, but no good harbors. The surface is undulating, and generally very fertile, with river-bottoms of great productiveness. The sea-coast is sandy, but well timbered with live oak, magnolia, and pine, and is considered one of the most healthy districts in the world. The state borders for 500 m. on the Mississippi, and is drained by its tributaries, the Yazoo, Black, Sunflower, etc., and by the Pearl and Pascagoula, flowing into the gulf of Mexico. The country is of the tertiary and upper secondary formations, with great alluvial valleys; the climate, semi-tropical; the chief productions: cotton, sugar, maize, wheat, sweet potatoes, peaches, figs, oranges, etc. In its forests are found the ocer, pan, bear, wolf, wildcat, paroquets, wild turkeys, and pigeons, with fish and alligators in the rivers. The Mississippi is a most valuable water-power, and has immense wealth and resources. Mississippi had in 1870 a population of 827,922. It has the largest cotton-growing area in the union; in 1877 no less than 2,955,000 acres. In 1877 the state debt was $2,954,458; the income was $865,327. Mississippi has a university, four colleges, and many benevolent institutions. This region was traversed by De Soto in 1542. La Salle descended the Mississippi in 1682, and claimed the country for France; in 1698 M. d'Iberville formed settlements on the coast at Ship island and Biloxi. Natchez was settled in 1700; but in 1728 this settlement was destroyed by the Natchez tribe of Indians, who were afterwards defeated, and the survivors sold into slavery in St. Domingo. Mississippi was admitted to the union in 1817; it seceded in 1861, and joined the southern confederacy. In 1899 Mississippi agreed to the new constitution, and was restored to its place in the union. In 1863 the city of Vicksburg, after a long and gallant defense, was forced, by famine, to surrender to the federals, and Jackson, the capital, was taken and partially destroyed by the federals, and some of the finest regions of the state laid waste.

MISSISSIPPI (ante). In 1539 Fernando de Soto, with a band of Spanish adventurers, penetrated into that part of the state now known as the Great Yazoo bottoms, remaining more than a year. It was not until 1673, a hundred and thirty-two years later, that the French explorers, Joliet and Marquette, crossed the Mississippi river, landed at several places within the limits of the state. In 1682 De la Salle and the chevalier de Toni made their appearance among the Natchez Indians, and remained for some time. It was not, however, until 1699 that the first attempt to found a colony was made by Iberville, who brought 300 immigrants from France to the eastern shore of the bay of Biloxi. The place was called Biloxi, and it was the germ of the subsequent settlement.
of New Orleans and of the dominance of the French in that quarter. Bienville, after returning to France, came back in 1716 with Bienville and the chevalier de Tonti, a large body of immigrants, and a military force, and ascended the Mississippi to the present site of Natchez, where they founded a colony named Rosalie, in honor of the countess of Pontchartrain. It flourished for a little while, but in 1718 it fell with the whole region under the sway, for a time, of the Scotch speculator, John Law. Afterwards, when the "Louisiana bubble" had burst, the whole territory of Orleans fell into the hands of the Company of the Indies, and the small colonies in Mississippi grew but slowly. Bienville, the governor of the province, was so fortunate as to keep on good terms with the powerful Indian tribes, but his successor, Perrier, incurred the hostility of the Choctaws, and a conspiracy was formed by that tribe with others to expel the French from the whole region. The attack was made first upon Rosalie, Nov. 29, 1729, but the other settlements were assaulted nearly at the same time. At fort Rosalie 200 persons were killed, and more than 500 taken prisoners, while in the smaller settlements many were tortured and ruthlessly butchered. But a swift retribution followed. The French commander at New Orleans pursued the Indians to their strongholds, killed many, destroyed much property, released the captives, and took 427 prisoners, among them several chiefs. These prisoners were sent to San Domingo and sold for slaves.

The Company of the Indies having abandoned the territory to the king of France, Bienville, in 1733, was again made governor. He found the colony at war with the Chickasaws, and the conflict continued several years. Then there was a peace, followed in 1739 by another Indian war, instigated, it was said, by English adventurers. The French commander sought to negotiate, but without much success. In 1763 the whole region was ceded to France by England, after which immigrants flocked thither in considerable numbers from the English colonies on the Atlantic coast. In 1798, the United States having succeeded to all the rights of the English in this region, the territory of Mississippi, embracing all the region between the 31st and 35th parallels, was organized. In 1811 the portion of Mississippi below the 31st parallel, being a portion of the Louisiana purchase, was added to the territory. In 1817 Alabama was set off from Mississippi, and the latter was admitted to the union as a state in December of that year.

A broad, low ridge, running nearly n. and s. through the center of the state, divides the waters flowing into the Mississippi from those which find their way to the Atlantic through other channels. This ridge has a lateral extension westward to Vicksburg on the Mississippi, where it terminates in high bluffs. The country east of this water-shed consists of broad, gently rolling prairies, which produce large quantities of cotton and corn; while on the w., the land is broken, and consists of valleys and ridges, extending at right angles from the longitudinal ridge, and falling gradually off to the great basin of the Yazoo delta, a region embracing 4,000,000 acres of the very best cotton land in the state. The land in the central ridge, which is partly cultivated and partly covered by heavy forests, is rolling, and of a lighter, but yet productive, surface soil on a clay foundation. The s.e. corner of the state, below the railroad from Meridian to Jackson, is a rolling, sparsely settled country of open pine woods, stretching down to the Mexican gulf, and valuable mainly for pastureage, timber, and turpentine. There is not a mountain in the state, and the highest ridge has no elevation of more than 800 feet. The Yazoo basin, with an exception of some 200,000 acres, is subject to overflow at times of extreme high water. The valley areas of the n. section are fertile, while those of other parts of the state are often of an inferior quality. The bottom-lands in some cases are chalybe and wet, and portions of the prairies are not very fertile.

The state is well watered. The Mississippi forms the whole of its w. boundary, and into it flows the Homochitto, Big Black, Yazoo, and its tributaries, the Sunflower and the Tallahatchie. On the e. side of the central water-shed are the Pearl and its branches and the Pascagoula and Tombigbee, with their affluents, all of which flow at last into the gulf, on which the state has a coast line of about 90 m., with no good harbor except that of Ship island. In the extreme n.e. corner the boundary for 15 m. is the Tennessee river, into which flow several small streams. The principal ports on the Mississippi are Vicksburg and Natchez.

The mineral deposits are not of much value. In the tertiary formations coal is found in small quantities, with mineral fertilizers of some value, fire-brick and potter's clays, limestone, etc. Iron is found in some places, but nowhere in quantities to be of practical worth. The principal fossil found in the prairie region is a marine animal more than 100 ft. long, resembling the alogiron. Mineral and medicinal springs are of frequent occurrence, that of Cooper's well being the most important.

The summers are long and hot, but not unhealthy, save in the low bottom-lands. The winters are not very severe, but not unpleasant, save in the north. From October to June the climate is delightful. The highest temperature of the summer is 100°; the lowest of winter 18°. The mean annual temperature at Vicksburg varies from 64° to 67°.

A large portion of the state is covered with primitive forests. The principal deciduous trees are numerous species of oak, hickory (four species), black walnut, butternut, dogwood, black and sweet gum, beech, sycamore, cottonwood, red maple, ironwood, locust, papaw, and black and white mulberry. The principal evergreens are the pine (several species), the cypress, and the live oak. The fruits most cultivated are apples (in the n.e. Mississippi, Mississippi.
part of the state), grapes, pears, peaches, quinces, apricots, and plums; in the southern counties, figs, lemons, oranges, and bananas.

In the forests wild animals abound; among them wolves, bears, foxes, wildcats, panthers, raccoons, opossums, deer, rabbits, hares, squirrels, geophers, etc. Wild turkeys, quids, rice-birds, mockingbirds, and wild-ducks are found in great numbers. Hawks, vultures, and gulls, and birds of gray plumage are numerous. Alligators haunt the bayous of the Mississippi, and lizards and water-snares are found in the swamps and bottom-lands. Rattlesnakes and moccasin-snares, as well as a great variety of harmless reptiles, abound. Mississippi sound and the various rivers contain a great variety of edible fish. Oysters and other shell-fish are found in Mississippi sound.

Cotton and corn are the great agricultural staples, though wheat and oats do well in the upland regions. Excellentpasturage, with roots for swine, is found in the low-lands and in the river valleys. According to the census of 1870 there were 13,121,113 acres of land in farms, of which 4,269,146 acres were cultivated, while 8,911,367 acres were unimproved. The cash value of farms was $81,716,576, of farming implements $4,456,683.

The estimated value of all farm products for the year was $73,167,553. The wheat crop was 374,470 bush.; the corn crop, 15,657,316 bush.; the oats crop, 414,596 bush.; the cotton crop larger than that of any other state, was 764,638 bales; the wool clip, 288,288 lbs., the rice crop, 374,627 b. com. sugar, 49 hogsheads; cane-molasses, 152,164 b.; sorghum molasses, 67,599 gals.; Irish potatoes, 214,189 bush.; sweet potatoes, 1,748,432 b.; peas and beans, 176,417 b.; beeswax, 9,390 lbs.; honey, 199,581 lbs.; butter, 2,613,-

321 lbs.; cheese, 1,099 lbs.; milk sold, 17,652 gallons. Value of live stock, $29,940,238; number of horses, 90,221; mules and asses, 8,886; milk cows, 173,598; working oxen, 5,156; other cattle, 269,630; sheep, 229,732; swine, 813,381. The corn crop of 1873 was 18,543,000 bush., valued at $1,761,550; wheat, 15,190,000 bush. $30,875,500; oats, 492,000 bush., $423,120; Irish potatoes, 206,000 bush., $247,40; tobacco, 85,000 lbs., $15,450; the cotton crop about 600,000 bales, $28,500,000. Within the last few years a new industry, that of raising early fruit and vegetables for the Chicago and other north-western markets, has sprung up. The center of this industry is at Crystal Springs, where the soil and climate are peculiarly favorable for the purpose. Already the trade has increased to a point which may be expected to continue.

The state agricultural department at Washington, Jan. 1, 1874, estimated the number of horses in the state at 88,300, valued at $7,682,100; mules and asses, 99,000, valued at $10,763,990; milk cows, 180,100, $3,866,558; oxen and other cattle, 329,500, $4,033,242; sheep, 153,000, $296, 48; swine, 819,100, $2,576,659; total value of live stock, $29,000,000. One of the greatest impediments to the agricultural prosperity of the state is the frequent inundation of its alluvial lands by the overflow of the Mississippi. This can be prevented only by the construction of costly levees. Mississippi and Louisiana have expended millions of dollars for this purpose; but the work is too extensive for their resources, and they propose, in view of the national importance of the Mississippi as a channel of commerce, that congress shall provide for its accomplishment at the nation's expense. Mississippi is not, to any great extent, a manufacturing state, though its natural facilities therefor are great. In 1870 there were in the state 1,731 manufacturing establishments, mostly small, employing 5,941 persons, using 4,961,714 of capital, paying $1,347,428 in wages, and producing $4,948,18. The number of persons engaged in lumbering was 1,663 persons, and producing lumber valued at $2,069,143; 45 flouring-mills, producing flour valued at $468,576; 85 wagon and carriage factories, producing $38,923. In 1873 there were 11 cotton factories, using 2,545 bales.

There were within the state in 1875, 1,141 m. of railway, belonging to 12 different lines, with an aggregate capital of $1,878,163; and a funded indebtedness of $3,325,000.

The assessed valuation of property in 1870 was $177,378,820; the true valuation was supposed to be about $210,000,000. The debt of the state in 1871 (deducting $7,000,000 of bonds repudiated in 1842) was $3,558,629, of which $1,157,415 was due to the school funds. The receipts of the state treasury in 1874 (deducting $735,936 for uncurrent and unavailable funds, and $74,299 in the shape of certificates of indebtedness) amounted to $1,885,618; the disbursements to $1,253,140.

The state has three customs districts—Natchez, Pearl River, and Vicksburg. The direct foreign trade and the coastwise trade are carried on entirely in the Pearl River district, of which the only port is Shucksborough. The amount of foreign commerce in 1874, consisting mainly of exports, was $233,406; the number of vessels entered as engaged in that trade was 93, aggregating 22,523 tons; clearances, 94—tonnage, 20,249 tons; entrances in the coastwise trade, 68—tonnage, 12,048 tons; clearances, 96—21,382 tons; total tonnage of all kinds, 76,292.

There were no national and but five state banks of deposit in Mississippi at last accounts; the five had an aggregate capital of about $550,000. Six savings banks have a capital of not far from $300,000. An insurance department was connected with one of the banks of deposit, and also with one of the savings banks, and there were 21 insurance companies of other states doing business in Mississippi.

According to the census of 1860, the population of the state was 791,705, of which 353,889 were white, 430,631 slaves, and 775 free colored. The slaves having been emancipated in suppressing the rebellion, the population of 1870 was 827,922, of which 362,886 were white, and 446,036 (including 16 Chinese and 809 Indians) were colored.
Mississippi.

males, 413,921; females, 414,501; natives of the country, 816,731; persons of foreign birth, 11,191; persons of school age (5 to 20 years), 378,999; voters, 174,815. Pop. 80, 1,131,592.

The constitution of the state at the time of its admission to the union recognized the need of a good common-school-system, and congress was asked for an appropriation of public lands to promote the object. Grants were accordingly made at different times, amounting in all to 10,631,889 acres, an amount equal to one-third of the state. The proceeds of these lands, as far as they have been sold, have been mostly diverted from their legitimate object and lost by gross mismanagement. Indeed, before the rebellion there was no well-regulated system of common schools, or hardly an effort to secure such a boon, the policy of this as well as of the other slave states being unfavorable thereto. After the national troops gained a foothold in the state, northern benevolent societies began to establish schools, but they were attended mainly by the negroes. Appropriations from the Peabody fund and from the resources of the Freedmen's bureau were added to the contributions of the benevolent societies, and a beginning of a better educational system was made. After the state was reconstructed, the legislature enacted laws for the establishment of a common-school-system, and since that time much has been done to carry those laws into effect. In 1873 an act was passed placing the schools under the management of a state board of education, a state superintendent, county superintendents, and local boards; providing that white and colored youth should not be taught in the same school-house, nor in school-houses nearer to each other than two and a half miles; that the Bible should not be excluded from the schools, and that the proceeds of land sold for taxes, from fines, forfeitures, breaches of penal laws, etc., should be set apart for the support of schools. Another act was passed making provision for a system of high schools. In 1878 the number of children of school age was 318,241, of whom 158,159 were white, and 190,082 were colored. Number of children in school, 265,853, of whom 100,674 were white, and 165,179 were colored. Average monthly enrollment, 171,296, of whom 82,596 were white, 88,690 colored. Average daily attendance: whites, 64,318; colored, 71,635; total, 155,954. Number of teachers: white, 2,943; colored, 1,813; total, 4,756. Average monthly salary of white teachers, $28.92; of colored teachers, $26.92. The total amount of state funds expended for schools in 1874 was $1,342,398, of which over $1,000,000 was raised by state tax. Nearly or quite all such tax was raised on local taxation, and the legislature is succeeded in saving from the wreck of the school-fund nearly $2,000,000. There were in the state in 1873, 8 high and 2 normal schools—one of the latter at Holly Springs in the n. section, and one at Tougaloo, near the center. The number of private schools in 1874 was 586, attended by about 13,000 pupils. Number of persons who could not read or write in 1870 was 319,813. The university of Mississippi at Oxford has classical, scientific, and law departments; while Alcorn university (colored) at Oakland has scientific and agricultural departments. There are, besides, Mississippi college (Baptist) at Clinton, Pass Christian college (Roman Catholic) at Pass Christian, Madison college at Sharon, Tougaloo university (unsectarian, but under Congregational auspices) at Tougaloo, and Shaw university (Methodist) at Holly Springs; and not less than nine colleges and seminaries for the instruction of girls, mostly under the patronage of different Christian sects—Methodist, Presbyterian, Baptist, Cumberland Presbyterian, and Episcopal.

The state has an institution for the deaf and dumb, and another for the blind, near Jackson, the capital. There are two orphan asylums at Natchez, both under Roman Catholic control, and there is a soldiers' orphans' home for children of confederate soldiers near Laurel Springs. The state hospital for the insane and the penitentiary are at Jackson.

According to the census of 1870 there were in the state 111 newspapers and periodicals, of which 3 were daily, 6 tri-weekly, 3 semi-weekly, 92 weekly, 2 semi monthly, and 5 monthly.

The number of church organizations in 1870 was 1829, of church edifices 1800; value of church property, $2,360,500. The principal denominations, in numerical order, were: Methodists, Baptists, Presbyterian's, Cumberland Presbyterians, Episcopalians, Roman Catholics, and Lutherans.

The state is divided into 79 counties. The governor, lieutenant-governor, and other state officers, are elected for a term of four years; and the legislature, meeting biennially, is composed of a senate and house of representatives—the members of the former elected for four and those of the latter for two years. The supreme court is composed of three judges, appointed by the governor, by and with the advice and consent of the senate, for a term of nine years. The circuit court is composed of 15 judges (corresponding with the number of judicial districts), appointed by the governor, by and with the advice and consent of the senate, for a term of six years. The judges of the court of chancery, 20 in number, are appointed by the governor for four years. The salaries of the supreme court judges are $4,500 each; those of the circuit court judges are $3,500, and those of the chancery court judges $3,000.

The electoral votes of Mississippi for president and vice-president of the United States have been cast as follows: 1820, 2 for Monroe and Tompkins; 1 vacancy; 1824, 3 for Jackson and Calhoun; 1828, 3 for Jackson and Calhoun; 1832, 4 for Jackson and Van Buren; 1836, 4 for Van Buren and R. M. Johnson; 1840, 4 for Harrison and Tyler;
MISSISSIPPI, a co. in n.e. Arkansas, having the Mississippi river for its e. boundary, separating it from the state of Tennessee, the river St. Francis and lake St. Francis for its s.w., and the state line of Missouri for its n. boundary; 900 sq. m.; pop. '80, 7,330—its separating 185 miles, including 130 miles of American birth. 2,411 colored. It is drained by Little river, the Obion, and several lakes of considerable size, the largest being Big lake. Its surface is generally level, but diversified by cypress swamps, bayous, canals, and back forests. Its soil wherever tiltable is fertile and adapted to the production of cotton and corn, stock raising being carried on to a limited extent. Capital, Osceola.

MISSISSIPPI, a co. in s.e. Missouri, having the Mississippi river for its e. and n. boundary, separating it from Kentucky; 370 sq. m.; pop. '80, 7,250—9,020 of American birth, 2,141 colored. Its surface is generally level, diversified by sloughs and low swampy sections covered with a thick growth of cypress trees, and having small lakes, and James and Cypress bayous in the s. section. The soil under cultivation produces wheat, oats, Indian corn; pork is among the staple products, and horses, cattle, sheep, and swine are raised. It is intersected by the Cairo and the Belmont divisions of the St. Louis, Iron Mountain and Southern railroad, centering at its co. seat, and it contains in the s.e. section the town of Belmont, the first battle-field on which Gen. Grant had chief command. Capital, Charleston.

MISSISSIPPI RIVER (Indian, Miche Scape, Great river, literally, Father of Waters), a river of the United States of America, the principal river of North America, and including its chief branch, the Missouri, the longest in the world, rises in the highlands of Minnesota, in a cluster of small lakes, and near the sources of the Red river of the north, and the rivers which flow into lake Superior, in lat. 47° 19' n., long. 94° 54' w. Its sources are 1080 ft. above the gulf of Mexico, into which it enters. Its general course is southerly, with numerous windings, giving it a length of 2,986 m. to its mouth, in 49° 29' n. long. 89° 30' w. By which, to the source of the Missouri, is 1,508 miles. The Mississippi and its branches drain an area of 1,226,600 sq. miles. It is navigable to the Falls of St. Anthony, 2,200 m., and by smaller boats above the falls; or by the Missouri, 3,550 m., and has 1500 branches, the chief of which are the Red river, 310 m. from its mouth; the Yazoo, 531 m.; the Arkansas, 700 m.; the Ohio, 1053 m.; the Missouri, 1233 miles. The Mississippi river forms a portion of the boundaries of ten states, having the southern part of Minnesota, Iowa, Missouri, Arkansas, and most of Louisiana on the w. bank; and Wisconsin, Illinois, Kentucky, Tennessee, and Mississippi on the east. The chief towns situated on its banks are New Orleans, Natchez, Vicksburg, Memphis, St. Louis, Quincy, Keokuk, Galena, St. Paul. The upper Mississippi, above the junction of the Missouri, flows through a picturesque and beautiful country. The great lower valley is 500 m. long, and from 30 to 50 wide. The delta, through which now its numerous bayous, is 150 m. wide. The alluvial plain through which the river winds has an area of 51,500 sq. m., and the delta 14,000 sq. m., all of which, except a few bluffs, is pine, cedar, and cypress woods and frequent inundations. The descent of the plain is 320 ft., or 8 in. per mile. The river at high water is higher than the plain, and the banks higher than the swamps of the interior. The great floods rise 40 ft., above low water at the head of the plain, and 20 ft. at New Orleans, and for the whole distance the average is 3,500 ft. wide, and is from 75 to 120 deep. There is no apparent increase from the largest branches, and it is estimated that 40 per cent of the floods are lost in the great marshes. Thousands of acres of land upon the banks are annually carried away by the current, with their growth of timber.

MISSISSIPPI RIVER (n. b.), the sources of this great river are lakes Itasca, Travers or Peninjdi. Cass, Winnibigoshish, Fishing, Leech, and Mud, lying among hills of drift and bowlders, in the midst of pine forests and marshes. From lake Itasca to Travers the stream is about 12 ft. wide and 2 ft. deep. It issues from the latter 120 ft. wide to Cass lake, which it leaves with a width of 172 ft., contracting and deepening below as it flows through marshes till it comes to a junction with Leech river, where it has rapids of 20 ft., called the falls of Pegagama, 270 m. from the source. From this point small steamers navigate. The total descent to this point is 324 feet. Thence to the mouth of Pine river, about 200 m., the river falls 105 ft.; thence to Crow-wing river 47 m. one ft. per mile. The river is narrow through this distance and winds through oak and maple forests, marshes, and sandy hills, where the natural formation of rock is overlaid with the gravel and bowlders of the drift period. Below, the river passes through a prairie country down to Elk river, and is stained slightly with the brownish color given by piney and marshy vegetation; 133 m. below the Crow-wing are the Sauk rapids one m. long, where the first regular formation of rock is seen on its banks. This is of the Potsdam sandstone, which extends from that point down to Dubuque and Rock Island. The falls of St. Anthony at Minneapolis are only 18 ft., with a breadth of 1200. Up to this point the river is navigable for commercial purposes, widening below from what is called Lake Pepin, studded with many islands. From above the falls of St. Anthony to the junction with the Missouri, the river flows through a valley of great beauty and uniform
Mississippi.

fertility. Cliffs and rocky bluffs, from 200 to 300 ft. high, give a picturesque character to that part of the valley below Rock Island, where its strikes the carboniferous strata, the geological formation of the valley, to about 100 m. below the Missouri. At Rock Island, 350 m. below St. Anthony, there is a fall of 22 ft., and the Des Moines rapid, 475 m. below St. Anthony's, have a fall of 24 ft. The government has constructed ship channels around these rapids, so that the navigation of the upper Mississippi is uninterrupted below the falls of St. Anthony. The junction of the Missouri is like the marriage of a rough impetuous unmouth man with a refined and graceful woman. The surging, muddy, eddying waters of the greater stream, the Missouri, for a long distance flow side by side with the clear waters of the Mississippi, joining but not blending, till thrown together by many a crook and turn and eddy between the bluffs of the great valley. Before the Ohio river joins, the union is complete; but the waters remain turbid to their junction with the sea, and, where joined by the currents of the Arkansas and Red rivers, take a more reddish color. Three m. above cape Girardeau and about 30 m. above the mouth of the Ohio, the river begins to have a surface above much of the adjacent land; and for 1300 m. to the sea it flows over a vast alluvial deposit of its own creation, below the surface of which its tortuous bed is deeply cut, while the top of its current is higher than the land.

The mean annual velocity of the current below the junction of the Missouri is 3.28 ft. per second—about 24 m. an hour. The average annual rain-fall in its basin is estimated at 50.4 in.; and the yearly discharge of water into the gulf of Mexico at 145 cubic miles. The width of the mouth of the Ohio is from 75 to upward of 100 ft. The variation from lowest to highest water at Natchez, Vicksburg, and Cairo was formerly 52 ft., but is supposed to have been reduced to 46 ft. by new channels and levees. The sediment contained in the water below the Missouri is 1,000,000 sq. miles. The entire valley of the river is margined by deltas, and considerable parts of Louisiana, Mississippian, and Arkansas are all delta. The bottom-lands above cape Girardeau, which are occasionally overflowed, but which are clearly above the level of the river at ordinary stages, are to be distinguished from those large tracts adjoining the lower part which lie below the surface of the river at all seasons. The former are almost continuous on one side of the river or the other, and generally on both sides, from the falls of St. Anthony to three m. below cape Girardeau, where the surface is so low as to be subject to overflow in all seasons, save where defended by levees. These bottom-lands, both high and low, are distinguished by being overflowed on one side by the Mississippi; the most fertile; these northern being used for corn (maize) principally, and for tobacco and pasturage. Some of the largest have been reclaimed from liability to overflow by dikes across the water-channels by which they were inundated. Syu island in Pike co., Illinois, so reclaimed, is 40 m. in length. The American bottom extends from the mouth of the Missouri 90 m. down the river, with an average breadth of 6 miles. Below cape Girardeau (about 30 m. above the mouth of the Ohio), on the w. side, the whole country down to the gulf is mostly delta for an average width of 50 m.; and in high floods the river formerly overflowed nearly all the surface between the mouth of the Ohio and the St. Francis rivers in s.e. Missouri and eastern Arkansas, filling the lakes and lagoons of that region, and then flowing by numberless channels to the White river and Arkansas valleys, the bayou Macon, Washita, Red and Atchafalaya rivers into the gulf. This region is made safe from floods and habitable only by levees. The Louisiana delta has been for a hundred years to a great extent reclaimed by levees, on the whole area between the two rivers, extending the whole area between the Mississippi and the Yazoo, about 60 m. in width, has been partially protected for about 50 years, while the protection of the upper portion above Memphis is a more recent undertaking.

The first attempt to guard the lower part of the valley against the river floods was in 1717, when the French governor, De la Tour, ordered embankments for the protection of New Orleans. In 1728 the French planters of Louisiana were protecting each his own water-front, and soon after combined for joint work by neighborhoods and parishes. In 1828 the state of Louisiana began to take rigorous action for the more complete protection of its delta lands. In 1836 and 1838 several of the great side channels by which inundations had come were closed at the expense of the counties, and the question of the closing of all the overflow channels, so as to confine the stream to one bed in all stages of water, was the subject of much excited difference of opinion. The closure party prevailed, and one by one the side outlets of the Mississippi were cut off by levees, so that by 1844 every old river lake inlet for 600 m. up the w. bank had been effectually closed. The results were even more satisfactory than had been expected, so that the levee system was entered upon with increased spirit by the states bordering the river, and the aid of the general government was invoked to unify the work. Congress, in 1850, ordered thorough topographical and hydrographic surveys of the whole Mississippian delta, under the direction of capt. A. A. Humphreys and Hunt, H. L. Abbott, who began work immediately; but the report was not submitted until Aug., 1861. While the U.S. government were thus obtaining complete data for the completion of the whole work, not only with reference to the reclamation of the vast and fertile delta of the river, but with reference to the thorough improvement of its navigation from the gulf to its upper waters, the states most interested in the levees continued work upon them till
checked by the operations of the rebellion in 1862-64. By the report of Humphreys and Abbott, in 1861, it appears that substantial levees had been constructed on the e. side up to the n. line of the state of Mississippi, including one of great magnitude across the Yazoo pass—the largest of all the outlets closed; and that above on the e. side none of great magnitude were required. On the w. side the levees had been completed to the mouth of the Arkansas, and were partially completed, including the line 25 m. long opening into the St. Francis valley.

This was the condition of the lower Mississippi at the beginning of the rebellion. Louisiana alone had expended up to that time $18,000,000 on the levees of the main river; $5 000,000 more on its great side outlets, the Atchafalaya, Piquemine, and La Fourche; and $1,000,000 on the shore of the Red river. The state of Arkansas had spent $1,000,000; Mississippi, on her water-front of 444 m., $14,500,000; and the state of Missouri, on her front of 140 m., $1,640,000. The total expenditure by individuals, pari-thes, and states up to that time, on about 2,000 m. of the river shore, is estimated by C. G. Fershey, of New Orleans, at upwards of $41,000,000, without counting the cost of its maintenance. The report of Humphreys and Abbott, in 1861, recommended confining the river to a single channel and making the levees higher at all points, and relatively as follows: at the mouth of the Ohio, 3 ft. above the highest flood ever known (which was then that of 1859): 7 ft. above from Osceola to Helena; 10 ft. above from Helena to Island No. 71; thence down to Napoleon 8 ft.; thence to Lake Providence to be increased to 11 ft.; thence to the mouth of the Yazoo and Red River Landing to be reduced to about 6 ft.; and below to be reduced gradually to 3 ft.; and they estimated the cost of carrying out this recommendation at $17,000,000. The tendency of all streams to build up the level of their bottoms by bars formed at their mouths was met by a recommendation to construct a jetty system at the main mouth of the Mississippi, by which its depth should be increased and maintained.

The subject of levee construction was again taken up by the U. S. government by an act of June 22, 1874, authorizing president Grant to appoint a board of commissioners to make a full report on the best system for the permanent reclamation of the delta basin of the Mississippi. Maj. Gen. G. K. Warren and gen. Humphreys were put at the head of the commission, and reported, Jan. 29, 1875, substantially the recommendation of the preceding report, carried further up the great tributaries of the lower Mississippi; that the general government should make and enforce the laws necessary to execute and protect the work; and that the work should be divided "into six named drainage districts, viz.: 1. The St. Francis bottom-lands, comprising the w. bank of the river from Cape Girardeau to Helena; 2. the White river bottom-lands, lying between Helena and the mouth of the Arkansas; 3. the Tensas bottom-lands, extending from the Arkansas to the Red river; 4. the Yazoo bottom-lands, lying between the bluffs below Memphis and Vicksburg on the e. bank; 5. Louisiana below Red river on the e. bank; and 6. Louisiana below Baton Rouge on the e. bank. In each of these districts the commission recommended the appointment of a single controlling engineer, with full power in his district, subject to the control of a board composed of the chiefs of each department. The cost of the entire work recommended by this commission by districts was as follows:

The annual cost of maintenance is estimated at $2,000,000. The length of levees estimated on is 1775 miles.

The commissioners state the amount of land reclaimed and to be reclaimed by this system "at least 2,500,000 acres of sugar land, 7,000,000 acres of the best cotton land in the world, and not less than 1,000,000 acres of corn land of unsurpassed and inexpressible fertility." Other authorities place the area that will be reclaimed as high as 28,000,000 acres of good land. This probably includes the swamps that may be subsequently reclaimed.

The three main mouths or passes of the river to the gulf diverge where the river has trebled its mean width, that is about 7,500 ft., with a mean depth of about 26 feet. It is through the South pass that the recent great work of the government under cap.t. Eades has been done to deepen and confirm the main channel, and prevent the rise in the level of the bottom of the river. The outer edge of the bar formed at the mouth of the South pass since 1838 was found to have pushed into the gulf about 300 ft. a year. The depth of the gulf at the foot of the slope formed by the deposits of the river is from 300 to 500 ft., the course of the main or South pass being direct towards its deeper waters.

The report from which these facts are drawn is published under the title of the

The expenditures of the general government on the Mississippi have been as follows:

- Mouth of the Mississippi, 1836-56: $690,000
- Above the mouth, 1836-56: 465,000
- Mouth of the Mississippi, 1856-75: 1,224,000
- Between Illinois and Ohio rivers: 665,000
- Des Moines rapids: 3,628,290
- Rock Island rapids: 1,839,650
- Upper Mississippi and falls of St. Anthony: 677,610
- Mouths of the Mississippi, June 1, 1875, to June 1, 1879: 3,138,168
- Other parts of the river during the same time: 1,561,100

Total: $12,508,698

The following table gives the relative expenditures in several portions of the river since June 1, 1875:

Total expenditures for four years ending June 1, 1879: $4,719,208.

The delta of the lower Mississippi are everywhere threaded with interlace bayous and navigable channels, placing every cultivable acre of their lands near to steamboat navigation, one-tenth of the land being estimated as taken up by such water surfaces or channels. Below lat. 31° 30' the sugar-cane is grown on the delta only. Cotton is grown nearly the entire length of it, but most advantageously north of lat. 31°. Corn and sweet potatoes are grown in every part of its whole area, and in the northern parts, potatoes and the cereals do well.

The timber growing in the delta region of the Mississippi is mostly sycamore, cypress, and oak—the former margining the streams, the cypress occupying the swamps, and the oaks the lands not liable to frequent inundation, the live oak being principally found within a few hundred miles of the gulf.

The climate of the Mississippi valley ranges from semi-arctic to semi-tropical. At the falls of St. Anthony, and above, spirit thermometers must be employed to register the extreme low temperature in winter, which often touches 40° Fahr., and yet the extreme of summer heat is but a few degrees less at St. Paul than at New Orleans, 97° to 104°. The range between the extremes is about 65° more at the source than at the mouth of the river. The annual mean temperature at New Orleans is 69°; at Cairo, 45°.

For the history of the discovery and first settlements of the Mississippi, see Dr. Soto; Marquette, La Salle, Iberville; New Orleans; St. Louis; St. Paul, etc. For commerce of the Mississippi, see New Orleans; Memphis; and St. Louis. For improvements at the mouth, see Jetty.

MISSISSIPPI RIVER, IMPROVEMENTS AT THE MOUTH OF. See Jetty.

MISSISSIPPI SCHEME. The gigantic commercial scheme commonly known by this name was projected in France by the celebrated John Law (q.v.) of Louisiana, in 1717, and collapsed in 1720. Its primary object was to develop the resources of the province of Louisiana and the country bordering on the Mississippi, a tract at that time believed to abound in the precious metals. The company was incorporated in Aug., 1717, under the designation of the company of the west, and started with a capital of 200,000 shares, of 500 livres each. They obtained the exclusive privilege of trading to the Mississippi, farming the taxes, and coining money. The prospectus was so inviting that shares were eagerly bought; and when, in 1719, the company obtained the monopoly of trading to the East Indies, China, the South seas, and all the possessions of the French East India company, the brilliant vision opened up to the public gaze was irresistible. The Company of the Indies, as it was now called, created 50,000 additional shares, but a rage for speculation had seized all classes, and there were at least 800,000 applicants for the new shares, which consequently rose to an enormous premium. Law, as director-general,
promised an annual dividend of 200 livres per share, which, as the shares were paid for in the depreciated billets d'etat, amounted to an annual return of 120 per cent. The public enthusiasm now rose to absolute frenzy, and Law's house, and the street in front of it, were daily crowded with applicants of both sexes and of all ranks, who were content to wait for hours, may, for days together, in order to obtain an interview with the modern Pintos. While confidence lastest, a factitious impulse was given to trade in Paris; the value of manufactures was increased fourfold, and the demand far exceeded the supply. The population is said to have been increased by hundreds of thousands, many of whom were glad to take shelter in garrets, kitchens, and stables. But the regent had meantime caused the paper circulation of the national bank to be increased as the Mississippi scheme. Moreover, during the many war speculations that arose into crisis, had secretly converted their paper and shares into gold, which they transmitted to England or Belgium for security. The increasing scarcity of gold and silver becoming felt, a general run was made on the bank. The Mississippi scheme stock now fell considerably, and despite sundry desperate efforts, which were attended with momentary success, to keep up its credit, it continued to fall steadily and rapidly. In Feb., 1720, the national bank and the Company of the Indies were amalgamated, but though this gave an upward turn to the share market, it failed to put the public credit on a sound basis. Several useless attempts were made to mend matters; and those suspected of having more than a limited amount (fixed by a law passed at the time) of gold and silver in their possession, or of having removed it from the country, were punished with the utmost rigor. The crisis came at last. In July, 1720, the bank stopped payment, and Law was compelled to flee the country. A share in the Mississippi scheme now with difficulty brought 24 livres. An attempt to distribute in the state of the accounts of the company was ordered by government; much of the paper in circulation was canceled; and the rest was converted into "rentes" at an enormous sacrifice.

MISSISSIPPI SOUND, a narrow strait washing the coasts of Alabama and Mississippi from Mobile bay to Pearl river—about 50 miles. It is formed and separated from the gulf of Mexico by several islands: Dauphin, Petit Bois, Horn, Ship, Cat, and the isle au Pivid, the fifth of which is fortified. It is moderately deep, generally tranquil, and is supplied chiefly by the several coasting vessels running between Mobile and New Orleans by the way of Lake Pontchartrain.

MISSISSIPPI, UNIVERSITY or, at Oxford, Lafayette co., was organized in 1848. By the liberality of the congress of 1819, two years after Mississippi had been admitted into the union, an entire township of the public domain within the state—23,040 acres—was granted to the state for the purpose of establishing a seminary of learning. The title to this land was, by act of congress, vested in the state legislature, to trust, for the support of the institution. The trust was accepted by the legislature, and, in pursuance of the spirit and intent of the act, "lands of great value" were selected by the state, and, in due time, 35 of the 36 sections were sold. Upon this foundation the university was established, and, when it was located at Oxford, the citizens of Lafayette co., gave it a section of land as a site for its buildings. The endowment amounts to the sum of $5,400,000, and the annual income to more than $32,000. It has 10 buildings, which, with their contents, are valued at $300,000. The libraries contain over 6,000 volumes, which have been carefully selected with the view of supplying all the needs of classical, scientific, and law students. With physical, chemical, and electrical apparatus, and with cabinets of minerals, rocks, and shells, and other fossils, the university is well supplied. The geological department has a fine collection of accurate maps and charts, and geological reports of the various state surveys. The herbarium contains specimens of all the forms of vegetable life indigenous to Mississippi and some of the adjoining states. Zoology has rendered more interesting and intelligible by maps showing the geographical distribution of animals, and by a collection of vertebrates which is increased every year. This department also possesses maps showing the geographical distribution of plants. The university comprehends three general departments: 1. That of preparatory education; 2. That of science, literature, and the arts; 3. That of professional education, embracing for the present only a school of law, with 1 professor and 5 lecturers. The number of professors (1850) is 8; tutors, 3; 1 principal of high-school and 2 assistants; students in all the departments, including the preparatory, 392; alumni, 492. Alexander P. Stewart, chancellor.

MISSIVE, in Scotch law, is a memorandum. See MINUTE: LETTERS.

MISSOLONGHI, also MESOLONGHI, a small t. of Greece, in the government of Eetolia, on the northern shore of the gulf of Patras, 24 m. w. of Lepanto. It is chiefly memorable for the two sieges which it underwent during the war of independence in the latter part of the present century. In 1822 it was invested by land and sea by the Turks, who, after a siege of two months, were compelled to withdraw. In 1826 it was again besieged by an overwhelming Ottoman force, and after ten months of resistance and suffering, its garrison, reduced from 5,000 to 3,000 fighting-men, cut their way through the ranks of the enemy, carrying with them a great number of the women and children. The Turks then entered the town, which was all but totally destroyed. Here lord Byron died in 1824. Pop. about 4,000.
MISSOURI. one of the United States of America, in lat. 36° 30' to 40° 30' n. and long. 89° 2 to 95° 52' w., being 377 m. from n. to s., and from 200 to 812 m. from e. to w., having an area of 67,380 sq. m., or 43,123,200 acres. It is bounded n. by Iowa; e. by the Mississipi river; s. by Arkansas; and w. by Nebraska territory, Kansas, and the Indian territory. Missouri has 114 counties. Its chief towns are Jefferson City (the capital), St. Louis, Kansas City, Hannibal, St. Joseph, Lexington. Its chief rivers are the Mississipi, which borders the state for 470 m.; the Missouri, which forms a portion of its western boundary, and passes through it from w. to e.; and its affluent, the Osage, Gasconade, etc. The country s. of the Missouri river is undulating, rising into mountains toward the borders of Arkansas; the northern portion of the state is level prairie-land, with rich bottoms, and high picturesque bluffs on the rivers. The geological formations range between the lower Silurian and upper coal. There are porphyritic rocks in the s.; in the center, coal-measures, with veins of an aggregate thickness of 500 ft., highly bituminous, and immense deposits of iron, with lead and iron in limestone formations. The winters are long and severe; the summers hot, with sudden changes. Much of the land is very fertile, producing maize, wheat, hemp, tobacco, the peach, nectarine, grape, etc. Cotton is grown in the southern counties. A large German population has introduced wine-making. The chief manufactures are ironworks, distilleries, and breweries. St. Louis has a large trade, and the western towns supply caravans or trains to New Mexico, Utah, and California. The counties of the state have appropriated land to a fire-brigade system, and in 1875 there were 3,036 miles completed, and several hundred under construction. There are 39 universities and colleges, several medical and ecclesiastical seminaries, 8,000 public schools with 370,000 pupils, and above 2,000 churches. Missouri was formerly a part of upper Louisiana. St. Genevieve was settled in 1755 by emigrants from Canada and Spain. St. Louis, a French trading-post, in 1775 had 800 inhabitants. The country was purchased by president Jefferson in 1803; and in 1821, after a great contest, was admitted into the union as a slave state, under what was called the Missouri compromise, which admitted Missouri, but prohibited slavery n. of the northern boundary of Arkansas, 36° 30' n. lat. In 1861 Missouri joined with the seceded states, and became a scene of civil war and violent partisan conflicts. Pop. in 1820, 66,586; in 1840, 393,792; in 1860, 1,182,317; in 1870, 1,715,000.

MISSOURI (state) was a part of the vast territory claimed by the French as original discoverers and settlers, which, in the grant of Louis XIV. in 1712, was called Louisiana. The states of Arkansas, Iowa, Kansas, and Nebraska were also a part of this great region, the northern portion of which was called upper Louisiana. As early as 1720 the lead mines of Missouri attracted attention, but it was not until 1755 that the first settlement in the territory was made at St. Genevieve. In 1762 France ceded all that portion of the territory w. of the Mississipi to Spain, and that on the e. to England. In 1800 the region w. of the Mississipi was retroceded by Spain to France, and in 1803 it was sold by the latter to the United States. In 1755 St. Louis was known as a fur-trading post, with less than 1000 inhabitants, while St. Genevieve had about half that number. These and the smaller settlements grew very slowly until Louisiana and upper Louisiana alike came into possession of the United States. The vast region was then divided by congress into the territory of Orleans and the district of Louisiana-Missouri being included in the latter, which in 1805 was erected by congress into a territory, with St. Louis as its seat of government. In 1812, when a part of the territory of Orleans was admitted as a state to the union under the name of Louisiana, the name of the territory of Louisiana was changed to Missouri. The limits on the w. were enlarged from time to time by treaties with the Indian tribes. In 1810 the population numbered 29,843, of whom all but 1500 were within the present limits of Missouri. In 1817 the total population having increased to 69,000, while St. Louis was a town of 5,000 inhabitants, the territorial legislature of Congress to frame a constitution with a view to the admission of the territory into the union as a state. This application led to a fierce excitement, not only in congress, but throughout the country. A very large number of the people of the free states were earnestly opposed to the admission of any more slave states to the union, while the people of the slave states were resolved that Missouri should not be excluded on this account. The subject was debated in congress with such heat that many citizens were alarmed lest it should lead to a dissolution of the union. Indeed, it was openly declared by some of the champions of slavery that the country would be
Missouri.

48

disrupted and the national government overthrown if the petition of Missouri were rejected. These threats so terrified some of the northern representatives that they yielded to the southern demands, and Missouri was admitted to the union in 1820 under conditions set forth in what has ever since been known as "the Missouri compromise," and which, as an offset for the addition of another slave state to the union, solemnly enacted that the system of slavery should be forever excluded from all that part of the territory of the United States lying n. of 36° 30'. The admission was consummated by a presidential proclamation dated Aug. 10, 1821. The growth of the state was henceforth rapid. At the time of the rebellion in 1861, the people were about equally divided in sentiment, one portion adhering to the union, the other to the southern confederacy.

The struggle between these two parties was very severe. The friends of secession, having control of the state senate, induced that body to call a state convention, but the body so summoned proved favorable to the maintenance of the union, and the scheme of the secessionists was defeated. Union troops having entered the state in considerable numbers, Gen. Jackson, June 12, 1861, issued a proclamation calling into service 50,000 of the state militia "for the purpose of repelling invasion, and for the protection of the lives, liberty, and property of the citizens." The governor, in thus assuming that the presence of the union troops was an "invasion" of the rights of the state, endangering the lives, liberty, and property of the citizens, proclaimed himself in rebellion against the national government. Gen. Lyon, with a force of 1500 men, having taken possession of Jefferson City, the capital, in the name of the United States, and Gen. Jackson and the other secessionist officers having fled, the state convention again assembled, and on Aug. 28, 1861, the southern constitution was adopted. Gen. Lyon (Gamble) was inaugurated, and on the 5th the deposed governor issued from New Madrid a proclamation that the state was out of the union. Confederate troops in large numbers having assembled in the s.w. part of the state, Gen. Lyon advanced from Boonville to Springfield to resist them. A battle took place Aug. 10, in which Gen. Lyon was killed. The union forces, under Gen. Sigel, retired to Rolla. On Aug. 1 Gen. Fremont, commanding the department of the west, declared martial law throughout the state.

At Aug. 20 the rebel general Price compelled the federal forces, numbering 3,000, to retire from Lexington. Fremont thereupon hastened from St. Louis to Jefferson City, but the confederates, numbering 20,000, under Gen. Price, retreated to Springfield and still further south. Fremont thereupon moved to the s.w. in five divisions, under Gen. Hunter, Pope, Sigel, Asboth, and McKinstry. Nov. 2 Fremont was succeeded by Gen. Hunter, and on the 18th Gen. Halleck took command of the western department. Meanwhile a quorum of the legislature elected before the contest began, having assembled at Necessity Newton, passed an act declaring the state to be a part of the confederacy. Early, however, in 1862 a strong federal force under Gen. Curtis drove the confederates into Kansas. During the rest of the year the state was disturbed by a guerrilla war, kept up by secessionists who had not removed within the confederate lines. In the summer of 1863 the state convention elected in 1861, and which had been kept alive by successive adjournments, passed an ordinance providing for the emancipation of all the slaves of the state in 1870. In 1864 gen. Price again invaded Missouri, threatening St. Louis, and traversing a large part of the state; but he was soon driven back again to Arkansas. The first state election since the war was held Nov. 4, 1864, and on Jan. 6, 1865, a state convention assembled in St. Louis and framed a new constitution, which in the following June was ratified by the people by a vote of 43,370 to 41,808. During the war the state furnished to the federal armies more than 108,000 troops. In 1869 the legislature ratified, by a large majority, the 15th amendment to the constitution of the United States. The population of the state in 1875, according to a state census, was a little short of 2,000,000. Pop. 1860, 1,168,801.

The Missouri river, flowing across the state from w. to e., divides it into two parts, the largest of which lies s. of that stream. This portion of the state presents a considerable variety of surface. Extensive bottom-lands lie along the Mississippi from cape Girardeau to the Arkansas river. In these lands are many lakes and lagoons, with islands never submerged by the highest floods. In them also are many almost impenetrable swamps, filled with heavy growth of cypress. The most notable of these is the Great swamp, extending from a point near cape Girardeau s. 100 m.; and then reaching far into Arkansas. These bottom-lands, if reclaimed and protected from overflow, would, no doubt, be highly productive. From a point a little below cape Girardeau, northward to the mouth of the Missouri, the Mississippi is bordered by highlands, which, between St. Genevieve and the Maramec, take the shape of solid limestone bluffs, rising from 250 to 300 ft. above the river. From these highlands westward across the whole state, the land is smooth and broken but growing less precipitous as the Ozark river is approached. In the s.w. part of the state are the Ozark mountains, or hills, lying not in continuous ranges, but in isolated knobs and peaks, rising occasionally from 500 to 1000 ft., and presenting occasionally perpendicular cliffs of sandstone. The river valleys are moderately fertile, but subject to overflow, while the soil upon the hills is shallow. This part of the state is but sparsely populated. The region n. of the Missouri, and bounded on the w. by the same stream, is generally level or undulating, except at points where it is intersected by the smaller rivers with their outlying hills. The bottom lands on the Mis-
Missouri.

Missouri and the Mississippi are exceedingly fertile,* Woodlands girt the streams, while the uplands are prairies, destitute of timber, but possessing a very productive soil.

The principal rivers of the state are the Missouri and the Mississippi; the former washing the entire e. boundary from n. to s., and presenting a shore line of 470 m.; the latter forming the w. boundary for nearly 290 m. from the low line to Kansas City, at which point it turns eastward, flowing across the state in a tortuous course for more than 250 m. to the Mississippi. These great streams are navigable at all times, except when obstructed by ice. The Osage, one of the s. affluents of the Missouri, is navigable for small steamboats half the year. The St. Francis, White, Black, Current, Gasconade, Grand, and Clariton are navigable for small boats at high water, usually in early summer. Among the principal streams of the class not navigable are the Fabius, Salt, South Grand, Nodaway, Platte, Spring, Sac, Nixgua, Ouivre, Piney, Maramee, and Castor rivers.

The mineral productions of Missouri are various and rich. Gold is found in the drift sands of the n., and silver in combination with lead in the galena and other ores. Iron in some form is found in every county, and in some places the supply is inexhaustible and of the richest quality. There are extensive bog ores in the s.e. part of the state, and the specular oxide is found in vast masses in the Iron mountain, Shepherd mountain, Simon mountain, Pilot Knob, and other places. Lead exists in immense quantities in two great fields, one in the s.e., the other in the s.w. part of the state. The lead production of Missouri is larger than that of all the other states of the union. Copper is also found in abundance in many places, and was formerly mined to a considerable extent, but since the discoveries of this metal on lake Superior these mines have been neglected. Nickel and cobalt are found at mine La Motte and the St. Joseph mines, and zinc is abundant in s.e. and s.w. Missouri. Carbonate of lime, gypsum, mica, hornblende, asbestos, bitumen, fire-clays, glass-sand, hydraulic lime and cement, polishing stone, slate-peter, building-stone, granite, sandstone, marbles, etc., are abundant. The coal fields embrace about one-third of the area of the state. The coal is various in kind and quality, from common bituminous to the best coked. Much of it is adapted to smelting purposes, and to the use of locomotives and stationary engines. There are in the state a great number of mineral springs, salt springs, hot springs, and sulphur springs. The salt springs of Howard county contain from 500 to 1200 grains of salt to the gallon.

The forests of Missouri are so extensive that wild animals are numerous. Among them are bears, panthers, wild-cats, wolves, foxes, raccoons, and opossums. Deer, rabbits, hares, and squirrels are abundant. Wild-turkeys, pigeons, quails, and prairie hens are in great numbers; song-birds and birds of gay plumage are numerous, and eagles, vultures, hawks, etc., prey upon the smaller birds. In the swampy regions on the Mississippi, wild-geese, ducks, herons, swans, etc., abound. Snakes, lizards, toads, frogs, and turtles are also numerous.

The climate of the state, with the exception of the river bottoms and swampy regions of the s.e., is generally healthful, though subject to great extremes of temperature. The summers are long, with a mean temperature of about 76°, the mercury sometimes marking 96°. The winters are cold and raw, with piercing winds, and a mean temperature of about 34°, sinking at times to 15°. The streams contain a great variety. The alluvial deposits on the Mississippi and the Missouri are very rich and productive. The swamps, when drained, yield enormous crops. The prairies of the n.w. are very fertile, having lost little of their productive qualities after 30 years of culture. The mixed prairie and rolling lands n. of the Missouri, on the e. side, produce wheat and tobacco of the best quality. They are also good for fruits. The lands in the s.w. part of the state are good for grapes, peaches, pears, and apples, and for most of the cereals. The least productive soil in the state is in the region between s.w. Missouri and the swampy lands on the Mississippi. This region is traversed by the Ozark mountains, and much of it lies at an elevation of from 1200 to 1500 ft. above the sea. Some of the valleys are rich, but the hills are only moderately productive. Near the Arkansas line is a narrow belt of fair cotton land. Only about one-third of the area of the state is cultivated, and much of the uncultivated portion is heavily timbered. The trees most common are the cottonwood, hickory, black walnut, oak of various sorts, sycamore, ash, willow, sumac, catalpa, hickory, etc. sassafras, dogwood, cedar, express, poplar, sweet gum, etc., and, near the Arkansas border, pine.

In 1870 there were in Missouri 21,707,229 acres of land in farms, of which 9,130,615 acres were improved and 12,576,605 unimproved. The estimated value of farms was $392,908,047; of farming implements and machinery, $15,596,426; value of farm productions, $103,035,759; of orchard products, $2,617,463; of market gardens, $406,655; wages paid, $8,797,487; forest products, $793,343; value of home manufactures, $1,737,606; of animals slaughtered or sold for slaughter, $23,626,784; value of all live stock, $84,295,273; number of horses, 493,969; mules and asses, 111,502; milch cows, 393,515; working oxen, 65,825; other cattle, 689,335; sheep, 1,352,001; swine, 2,300,450. The wheat crop was 14,315,926 bushels; rye, 559,593 bushels; corn, 66,634,675 bushels; oats, 16,578,313 bushels; barley, 369,240 bushels; buckwheat, 36,253 bushels; tobacco, 12,529,480 lbs.; cotton, 1,246 bales; wool, 3,649,390 lbs.; peas and beans, 43,980 bushels; Irish potatoes, 4,395,961 bushels; sweet potatoes, 241,258 bushels; hay sold, 613,011 tons.

U. K. X.—4

* Woodlands girt the streams, while the uplands are prairies, destitute of timber, but possessing a very productive soil. *
milk sold, $57,794 gallons; clover seed, 2,491 bushels; hops, 19,397 lbs.; hemp, 2,816 tons; flax, 16,613 lbs.; flax seed, 10,391 bushels; wine, 329,173 gallons; butter, 14,455 lbs.; cheese, 294,060 lbs.; maple sugar, 116,990 lbs.; maple molasses, 16,347 gallons; sorghum molasses, 1,730,174 gallons; beeswax, 53,248 lbs.; honey, 1,156,444 lbs. In 1873 the live-stock statistics were: Mules, 191,900, valued at $8,324,622; oxen and other cattle, 1,632,400, valued at $24,282,050; swine, 2,817,000, valued at $6,226,586; horses, 637,500, valued at $25,022,907; cows, 516,200, valued at $8,188,350; sheep, 1,296,400, valued at $3,091,276; total value of live stock, $75,398,231.

The statistics of manufactures in the state in 1870 are as follows: Number of establishments, 11,571; persons employed, 65,354, of whom 55,904 were males above 16—8,584 females above 16, and 5,566 were below that age; capital invested, $80,357,144; wages paid, $321,855,625; products, $900,000,000; percentage on the value of their products respectively, were: Blacksmithing, $2,257,211; agricultural implements, $1,588,108; lags other than paper, $5,857,250; boots and shoes, $1,690,552; bakery products, $3,100,053; brick, $3,148,884; bridge-building, $2,072,620; carpentering and building, $15,561,086; railroad cars, $2,200,150; carriages, etc., $3,253,734; men's clothing, $7,371,902; women's clothing, $1,050,170; confectionery, $1,274,185; cooperage, $2,234,581; flouring and grist-mill products, $31,837,352; furniture, $3,303,024; iron, forged and rolled, $1,455,000; pig-iron, $2,991,618; iron castings, $1,183,355; stoves, heaters, and hollow ware, $2,951,550; distilled liquors, $6,519,548; lumber, planed and sawed, $7,220,452; sugar refined, $4,135,250; animal oil, $4,100,000; patent medicines and compounds, $2,075,878; printing and publishing, $8,357,259; saddlery and harness, $5,421,655; sash, doors, and blinds, $2,563,416; soap and candles, $1,744,190; tin, copper, and sheet iron ware, $2,945,490; tobacco in all forms, $10,415,601.

The number of Missouri vessels on the public or private registers, in 1873, was 327, including 13 of foreign owners.
Missouri

Roman Catholic; St. Louis university, Roman Catholic; McGee college, at College Mound, Cumberland, Presbyterian; Christian university at Canton, under the patronage of the Disciples; Central college at Fayette, Southern Methodist; Hannibal college at Hannibal; Drury college at Springfield, Congregational; St. Joseph's college at St. Joseph, Roman Catholic; St. Paul's college at Palmyra, Protestant Episcopal; St. Vincent's college at Cape Girardeau, Roman Catholic; Lewis college, Glasgow; Methodist; William Jewell college at Liberty, Baptist; Woodland college at Independence, Disciples; Westminster college at Fulton, Presbyterian.

There are 4 theological schools, belonging respectively to the Lutherans, Roman Catholics, Presbyterians, and Baptists, 2 schools of law; 5 of medicine, 1 of which is homeopathic; 1 school of pharmacy, and 1 of dentistry. There are numerous academies, seminaries for girls, and other private schools of a high character, most of them under the control of some religious sect.

The public institutions for special classes are the asylum for the deaf and dumb at Fulton; the school for the blind at St. Louis; the state lunatic asylum at Fulton; the state penitentiary at Jefferson City; 13 orphan asylums, 8 of them under Roman Catholic control; an industrial school for girls; and a home for the friendless, at St. Louis.

The libraries of the state in 1870 numbered 5,645, and contained in all, 1,665,689 volumes; 1,769 libraries the same year, containing 468,996 volumes, were public; and 3,908, containing 366,642 volumes, were private.

The number of newspapers and periodicals in 1870 was 279, of which 21 were dailies, 5 tri-weeklies, 225 weeklies, 3 semi-monthlies, 23 monthlies, and 1 quarterly. In 1872 the whole number had increased to 289.

The number of church organizations in 1874 was 4,537; of church edifices, 3,369; value of church property, $313,002,909; number of church members, 264,673. The chief denominations, in numerical order, are: Methodists, Baptists, Disciples, Presbyterians, Roman Catholics, Cumberland Presbyterians, United Brethren in Christ, Lutherans, Episcopalians, Congregationalists, Free Will Baptists, German Reformed, Unitarians, Evangelical association, Jews, Swedes, Danes, and Friends.

The capital of the state is Jefferson City. The principal city, St. Louis, is the largest in the Mississippi valley. The next largest cities and towns in the state are Kansas City, St. Joseph, Cape Girardeau, St. Charles, St. Louis, Columbia, Springfield, Sedalia, and Lexington.

The constitution now in force was adopted in 1875. The governor and other state officers are elected for a term of 4 years. The state election occurs biennially on the Tuesday next following the first Monday in November. The legislature, composed of a senate and house of representatives, meets biennially on the first Wednesday after the first day of January. The supreme court consists of 5 judges, elected by the people for a term of 10 years, the oldest in commission being chief-justice. The legislature divides the state into such a number of circuits as it may judge the public convenience requires, and the circuit court is composed of one judge for each of such circuits, elected by the people of said circuit for a term of 12 years. The judges of the county courts are elected by the several counties, as are also the judges of probate. The compensation of the governor, state officers, members of the legislature, and of the judges of the courts, is fixed by the legislature. Special courts are provided for the city of St. Louis.

The electoral votes of Missouri for President and Vice President of the United States have been as follows: 1820, 9 for Clay and Jackson; 1824, 9 for Jackson and Calhoun; 1828, 9 for Jackson and Van Buren; 1832, 7 for Van Buren and Johnson; 1836, 9 for Van Buren and Johnson; 1840, 9 for Van Buren and Johnson; 1844, 7 for Polk and Dallas; 1848, 7 for Cass and Butler; 1852, 9 for Pierce and King; 1856, 9 for Buchanan and Breckenridge; 1860, 9 for Douglas and Lincoln; 1864, 11 for Lincoln and Johnson; 1868, 11 for Lincoln and Johnson; 1872, 6 for T. A. Hendricks, 8 for B. Gratz Brown, and 1 for David Davis, for President; and 6 for B. Gratz Brown, 5 for G. W. Julian, 3 for J. M. Palmer, and 1 for W. S. Groesbeck, for vice-president; 1876, 15 for Tilden and Hendricks; 1880, 15 for Hancock and English.

MISSOURIA INDIANS, or Missouris, a tribe thus named by the Illinois Indians, but whose designation for themselves was Nudarcha. They were inhabitants of the region of the lower Missouri, and allies of the Illinois, and afterwards of the French. In 1725 some of the chiefs of this tribe went to France with the French commander De Bourmont, and a sergeant in the command of the latter married a girl of the tribe. Yet this did not prevent the Missourias from assaulting their allies, and the French—a fort on an island in the river—was attacked by them, and the entire force massacred. The French and Missourias afterwards resumed their friendly relations, but the tribe never willingly accepted the English. They became greatly reduced, however, by small-pox and other diseases, and in 1805, when Lewis and Clarke were in their country, they numbered only about 390 souls. They abandoned their old camping-ground and dwelt with the Otoes, and both these tribes were eventually removed to the Big Blue. Their number, which was 708 in 1862, had been reduced, ten years later, to 664.

MISSOURI COMPROMISE, the proviso contained in the bill admitting Missouri into the union, Feb. 28, 1821. Up to the time when the bill for the admission of Missouri was brought before congress in the session of 1818—19, an equal number of slave-holding and non-slave-holding states had been admitted. Vermont, Ohio, Indiana, and Illinois had been granted Kentucky, Tennessee, Louisiana, and Mississippi. After Alabama was allowed to become a state, without prohibiting slavery, and the bill for the admission of
the territory of Missouri was introduced, Tallmadge, member of congress from New York, moved an amendment, which was passed by a vote of 87 to 76, prohibiting the further importation of slaves, and emancipating slave children when they should reach the age of 25. A few days afterwards Taylor of New York, by way of compromise, proposed to amend the bill setting off Arkansas into a territory, by a proviso that slavery should not be extended to any part of the territory ceded by France to this country n, of 36° 30' lat. His amendment met with bitter opposition from both northern and southern members, and was withdrawn. The opponents of slavery claimed that the question had been settled by the ordinance of 1787, which, in creating a government for the Northwest territory, provided that "there shall be neither slavery nor involuntary servitude in said territory otherwise than in punishment for crime." They maintained that the United States did not recognize slave property, whatever might be the laws of certain states; and they urged the authority of Jefferson, who had introduced a bill, in 1784, prohibiting slavery in the territory of the United States, and in such territory as might thereafter be annexed. The slave-holding members, on the other hand, maintained that congress had no constitutional right to prohibit slavery in the territories, and that such a prohibition would violate the provision guaranteeing to the citizen the enjoyment of his property. They declared that the south would go out of the union rather than submit to the proposed restriction. The senate disagreed with the house, and the bill failed to pass. Alabama was admitted in the session of 1819-20, and her admission was followed by that of Maine. Meantime a strong public feeling against slavery had been growing in the middle states and in New England. In 1829 the Pennsylvania legislature resolved that congress had the right to prohibit slavery in the territories; and the legislatures of the other middle states, of Ohio and Indiana, passed resolutions to the same effect. The legislatures of the slave-holding states, on the other hand, opposed any congressional restrictions upon slavery. When congress met, after a long debate the senate, largely through the efforts of Henry Clay; returned the Missouri bill to the house with the clause prohibiting slavery in that state stricken out, but with a new proviso that slavery should not thereafter be allowed n. of 36° 30'. The house struck out the restricting clause by a vote of 90 to 87, and passed the compromise proviso by 134 to 42. The result was to postpone for a time the settlement of the slavery question. The compromise was virtually destroyed by the Kansas and Nebraska bills of 1854.

**MISSOURI RIVER** (Mud river), a river of the United States, and chief affluent of the Mississippi, rises in two forks, the Jefferson and Gallatin, in the Rocky mountains, Dakota territory, lat. 45° n. long. about 112° west. Its course is first northerly for 500 m., then easterly 1200, then south-easterly to the mouth of the Kansas, and easterly to its junction with the Mississippi. Its length from its source to the Mississippi is 3,096 m.; to the gulf of Mexico, 4,506. It is navigable at high water to the Great falls, 2,540 m. from the Missouri. It is a turbulent, rapid stream, with a vast number of tributaries, the chief of which are the Osage, the Kansas, the Platte, the Cheyenne, the Yellowstone. The upper Missouri is remarkable for its scenery; at 411 m. from its source it enters the gate of the Rocky mountains, a gorge of 54 sq., between perpendicular walls 1200 ft. high and 450 ft. apart. At the Great falls, 145 m. below, the river falls 357 ft. in a series of rapids and cascades, 161 long. The largest fall is 87 ft., and the scenery is full of grandeur.

**MISSOURI RIVER (aute),** drains an estimated territory of 500,000 sq. miles. It joins the Mississippi at lat. 38° 50' 50' n. and long. 90° 13' 45' w. from Greenwich. From the point where the Kansas enters it, its course is nearly e., and within the state of Missouri. Its current, in this part of its course, is about 5 m. an hour. The frequency of snags makes navigation difficult. The banks are thickly covered with wood. Between fort Leavenworth and its mouth three considerable rivers discharge into it—the Kanas, the Grand, and Osage, all of which are navigable for 150 to 200 miles. From the Kansas to 40° 38' n. lat. it is the boundary between Missouri and the Indian territory; and thence to the Big Sioux, between the Indian territory and Iowa. The Platte discharges into the Missouri through three channels, its waters having made a delta at its mouth. Before the Platte, at least five smaller streams—the Big and Little Nemaha, the Nodaway, the Wabash Brush, and the little Tarkio—empty into the Missouri. The course of the river, from the mouth of the Platte to the Kansas, and from Fort Pierre to the Big Sioux, is s.e. Its general direction for the first 500 m. is n.; then it flows e.n.e. till it joins the White Earth, from whose mouth its general course is s.e. At a distance of 2,575 m. from its mouth occur the Great falls, where it descends 357 ft. in 161 miles. The highest of these falls is 87 ft., and between and below them is a series of rapids. At a distance of 1,216 m. from its mouth it is joined by the Yellowstone, its largest tributary; at 1810 m. from its mouth, by the Cheyenne; at 1390 m. from its mouth, by the White; at 883 m., by the Big Sioux; at 600 m., by the Platte; at 340 m., by the Kansas; at 240 m. by the Grand; and at 133 m., by the Osage. It is subject to two annual floods, one caused by the melting of the snow on the alluvial prairies, and occurring in May; the other, occurring in June, is caused by the melting of the mountain snows.

**MISSOURI, UNIVERSITY** of, at Columbia, near the center of the state, was organized in 1840. It has received the avails of Missouri's portion of the national grant of
land made by congress in 1862 for the establishment of colleges of agriculture and the mechanical arts, and upon this foundation it was reorganized in 1866. It embraces seven departments:—1. The college proper, founded in 1840; 2. the normal school, opened in 1868; 3. the agricultural and mechanical college; 4. the school of mines and metallurgy at Rolla, established in 1871; 5. the college of law, organized in 1872; 6. the college of medicine, organized in 1873; 7. the department of analytic and applied chemistry. The university is governed by a board of curators, appointed by the governor of the state with the advice and consent of the senate. It is open to students of both sexes. It had, in 1878, 20 instructors; and, in all the departments, 418 students. Samuel S. Laws, L.L.D., president.

MIST. See Fog.

MISTAKE is a ground in law for having a contract reformed, and may be set up in some cases as a defense; but a mere mistake as to the legal effect of a deed or contract is in general not regarded as a ground of recovery. When money has been paid by a mistake as to some important fact, it may be recovered back from the party to whom it was so paid by an action for money had and received; but if the mistake was made in a matter of law, it cannot be recovered back.

MISTAKE (ante), in law, is defined by Story as some unintentional act, omission, or error, arising from ignorance, surprise, imposition, or misplaced confidence. In courts of equity, as of law, the maxim applies, ignorantium facti excusat; ignorantium juris non excusat—ignorance of the fact, not of the law, excuses. Thus where one word has by clerical mistake been substituted for another, equity will remedy the mistake; but where the parties have knowingly used a certain form of language believing that its legal effect is different from what it is in reality, they have no such remedy. If the parties be ignorant as regards a fact and aware of their ignorance, yet intend to risk the result, or, knowing the facts, intend to compromise both the law and the facts, then courts will not regard the fact that one party profited less by the contract than he had expected. Where an estate was supposed by both vendor and vendee to belong to the vendor under the law of real property, and was sold in that belief, the court, notwithstanding that the mistake seemed to be one of law, ordered the purchase-money to be recovered back to the vendor. The title to land is considered to be of fact and not of law, as public policy does not make it necessary that a citizen should be acquainted with the laws of other countries than his own. A trifling or immaterial mistake will not be regarded as ground for disturbing a written agreement. Specific performance will not be enforced when it is clear that the defendant through a mistake not resulting from mere carelessness has entered into a contract materially different from what he had intended. The instrument or contract may be ordered to be re-executed, or may be rescinded altogether. Thus where a solicitor, in writing a conveyance, inserted double the sum intended as purchase-money, he was compelled to re-execute the deed. An award of arbitrators based on a mistake of fact will be rescinded by a court; and even when based on a mistake in law, if the questions of law were not especially referred to them. An important exception to the rule that mistake of law does not excuse exists in those cases where the defendant has voluntarily entered into a promise to perform some act, such as paying back money received by mistake, or by accepting a bill of exchange, because he supposed himself legally bound to do so, the fact being that he was not. That is to say, no mere want of a legal defense, ignorantly made, will compromise the rights of the maker. Often an instrument may be so construed by the court as to carry out the intentions of the parties, but in such case the construction must be supported by the instrument itself and not by external evidence; thus where there is a deed of certain land, it is allowable to explain what is meant by the description of boundaries or the relative ownership of several vendees; but if it be alleged that one piece of property has been mistakenly described in place of another, the deed cannot be rectified by mere construction of a court of law, but special action must be had in equity. Where there is any element of fraud or surprise involved, or where the case is one connected with trusts, equity will go very far in correcting the results of mistakes.

MISLETOE (Anglo-Sax. mistelæa). Ger. Mistel; the root of the Anglo-Saxon name means a line or prong, a shoot of a tree; mistel is of uncertain etymology, but probably the same as mis—400 known species, mostly tropical and parasitic. The leaves are entire, almost nerveless, thick and fleshy, and without stipules. The flowers of many species are showy. The calyx is acute from a two or rim, which sometimes assumes the appearance of a calyx, and is so regarded by many botanists; what others deem to be calyx is being viewed by them as a corolla of four or eight petals or segments. Within this are the stamens, as numerous as its divisions, and opposite to them. The ovary is one-celled, with a solitary ovule; the fruit one-seeded, generally succulent.—The only British species of this order is the Common Misletoe (V. album), a native also of the greater part of Europe, growing on many kinds of trees, particularly on the apple, and others botanically allied to it, as the pear, service, and hawthorn; sometimes, also, on sycamores, limes, poplars, locust-trees, and firs, but very rarely on oaks (contrary to the common belief). It is very plentiful in some parts of the south of England, its evergreen
leaves giving a peculiar appearance to the orchards in winter, when the bushes of mistle-
toe are very conspicuous and the naked branches of the trees; but it is very local. It is
not a native of Scotland, though found naturalized in various places. The leaves are
dichotomous (i.e., divide by forking); the leaves are opposite, of a yellowish-green color,
obovate-lanceolate, obtuse. The flowers are inconspicuous, and grow in small heads at
the end and in the divisions of the branches, the male and female flowers on separate
plants. The berries are about the size of currants, white, translucent, and full of a very
viscid juice, which serves to attach the seeds to branches, where they take root when
they germinate, the radicle always turning toward the branch, whether on its upper or
under side. The mistletoe derives its nourishment from the living tissue of the tree on
which it grows, and from which it seems to spring as if it were one of its own branches.
The berries are a favorite food of thrushes. Bird-line is made from them and from the
bark. The mistletoe was intimately connected with many of the superstitions of the
ancient Germans and of the British Druids. In the northern mythology, Balder is said
to have been slain with a special mistletoe. Among the Celts, the mistletoe which grew
on the oak was in peculiar esteem for magical virtues. Traces of the ancient regard for
the mistletoe still remain in some old English and German customs, as kissing under the
mistletoe at Christmas. The mistletoe was at one time in high repute as a remedy for
epilepsy and convulsions, but it seems to possess no decided medicinal properties.—
*Loranthus Europaeus,* a shrub very similar to the mistletoe, but with flowers in racemes,
is plentiful in some parts of the south of Europe, and very frequently grows on oaks.—
*L. odoratus,* a Nepalese species, has very fragrant flowers.

**MISTRAL.** This name is in Provence, near Saint-Remy, 1859; son of a rich farmer;
educated at the colleges of Avignon and Montpellier, and student of law, but not there.
after practicing it. His fame rests on his devotion to the revival of Provencal literature,
especially poetry. Collaborer in 1852 on the journal *Le Provencal,* he became known
at once both as critic and poet. His poems are *La Belle d'Avignon; La Fête du Mistral; Au
Sauterelle; La Course du Tourrou; Minerve; and Calendria.*

**MISTRETTA,** a.t. of the island of Sicily, 67 m. w.s.w. of Messina, capital of a district.
Pop., 71, 11,218. It occupies a healthy situation near the northern coast in the vicinity
of the river Nebraio.

**MITAKSHARA** is the name of several commentator works in Sanskrit, for instance,
of a commentary on the text-book of the Vedânta philosophy, of a commentary on the
Mimânsâ work of Kumârîka, of a commentary on the Bhrâhadâyaka (see VEDA, etc.).
The most renowned work, however, bearing this title is a detailed commentary by Vijnâ-
nâcwar (also called Vijnânamâtha), on the law-book of Yâjñavalkya (q.v.); and its
authority and influence are so great that "it is received in all the schools of Hindu law
from Benares to the southern extremity of the peninsula of India as the chief ground-
work of the doctrines which they follow, and as an authority from which they rarely
dissent" (cf. two treatises on the Hindu law of inheritance, translated by H. T. Cole-
brooke, Calcutta, 181). Most of the other renowned law-books of recent date, such as
the Smrîti-Chandrikâ, which prevails in the s. of India, the Chintâmanî, Viramitrodhyâ,
and Mayâkâ, which are authoritative severally in Mithilâ, Benares, and with the Mah-
rattas, generally defer to the decisions of the Mitakshara; the Dāyuhyânya of Umapravâhâna,
along with which is adopted by the Bengal school, differs on almost every disputed point
from the Mitakshara, and does not acknowledge its authority. The Mitakshara, follow-
ing the arrangement of its text-work, the code of Yâjñavalkya, treats in its first part of
duties in general; in its second, of private and administrative law; in its third, of purifi-
cation, penance, devotion, and so forth; but, since it frequently quotes other legislators,
exounding its texts, and contrasting them with those of Yâjñavalkya, it is not merely
a commentary, but supplies the place of a regular digest. The text of the Mitakshara
has been edited several times in India. An excellent translation of its chapter "On
Inheritance" was published by Colebrooke in the work above referred to; and its expla-
nation of Jánajvalkya is followed by the same celebrated scholar in his Digest of Hindu Law (3 vols. Calcutta and London, 1801), when translating passages from this ancient author.

MITRAU. See MITTAU, ante.

MITCHEL, John, 1815-55; b. Ireland; son of a Unitarian minister; graduated in 1836 at Trinity college, Dublin; and having been admitted to the bar, practiced for several years, when he removed to Dublin and became editor of the Nation. He now began to display a rebellious spirit, and wrote articles of a revolutionary tendency, thus falling under the suspicion and displeasure of the government. He was at this time in partnership with Gavin Dally, but quarreled with him, and about 1847 originated the publication entitled The United Irishman, which was suppressed after a brief existence, and Mitchell was sent to Australia under sentence for 14 years. He escaped from the penal colony Jan. 3, 1852, and succeeded in getting transportation to New York, where he founded a weekly newspaper called the Citizen. He suffered from the climate, and afterwards took up his residence in Tennessee, publishing there a paper called the Southern Citizen, which became notorious from its open advocacy of the re-establishment of the slave trade. During the rebellion he was in Richmond, Va., where he edited the Examiner newspaper. He returned to New York at the close of the war, made a visit to Ireland, and, in 1855, after he had again settled in New York, was returned to parliament from Tipperary, but being disqualified, did not take his seat. He once more went to Ireland, however, where he died. He published several works upon Irish subjects.

MITCHEL, ORMSBY MCKNIGHT, L.L.D., 1810-62; b. Ky.; received an excellent education when very young, being a good Greek and Latin scholar and mathematician when only 12 years of age. He entered West Point as a cadet in 1825, and after graduating in 1829, acted as assistant professor of mathematics in the military academy during the succeeding two years. He practiced law in Cincinnati from 1832 to 1834; and for the next ten years was professor of mathematics, philosophy, and astronomy in the Cincinnati college. In 1836 and 37 he was chief engineer of the Little Miami railroad. He interested himself greatly in astronomy, and took an important part in procuring the erection of an observatory in Cincinnati, of which, when completed, he became the director, combining with this position, in 1839, the directorship of the Dudley observatory in Albany. On the outbreak of the rebellion he entered the military service, being commissioned a brig. gen. of volunteers in Aug., 1861, and ordered to take command of the department of Ohio. He received his promotion to a major-generalship on account of a brilliant movement in April, 1862. He made a forced march into Alabama, and after a sharp engagement near Bridgeport, captured the railroad between Corinth and Chattanooga. In September he was ordered to the command of the department of the south, but before he had time to commence active operations, was attacked by yellow fever, and died. Gen. Mitchell had obtained a high reputation as an astronomer, and was remarkably successful as a mechanician in the construction of astronomical apparatus and instruments of precision. He made several important astronomical discoveries, including, with exactness, that of the period of rotation of the planet Mars. He wrote The Planetary and Stellar Worlds, and a Popular Astronomy; and, as early as 1846, published an astronomical periodical entitled The Sidereal Messenger.

MITCHEL, a co. in s.w. Georgia, having the Flint river on the w. and n. w.; 500 sq. m.; pop.'80, 9,392. It is intersected by a division of the Atlantic and Gulf railroad. The soil is generally fertile and the surface level. Productions are Indian corn, oats, sweet-potatoes, butter, cotton, and sorghum molasses. Co. seat, Camilla.

MITCHEL, a co. in n.e. Iowa, bounded on the n. by Minnesota; 431 sq. m.; pop.'80, 14,361. It is crossed by the Burlington, Cedar Rapids and Minnesota railroad. The soil is fertile, producing liberally of wheat, Indian corn, oats, barley, potatoes, and hay. There are manufactories of carriages and wagons, and agricultural implements; and woolen, saw, and flour mills. Co. seat, Mitchell.

MITCHEL, a co. in n. central Kansas, watered by the Solomon river; 720 sq. m.; pop.'80, 14,913. The surface comprises prairie land, very fertile; principal product, Indian corn. Co. seat, Beloit.

MITCHEL, a co. of n.w. North Carolina, bounded on the w. and n. w. by the Unaka mountains, which separate it from Tennessee, and on the s. w. by Nolichucky river; 630 sq. m.; pop.'80, 9,437. This county is important for its rich mines of mica, the working of which forms a most valuable industry. Iron and asbestos are also found; and forests of various kinds of timber cover the mountains. The productions are Indian corn, wheat, rye, potatoes, wool, and butter. Co. seat, Bakersville.

MITCHEL, DONALD GRANT, b. Conn., 1814; educated at Yale, and called to the bar. He made a European tour, and published the fruits of his observations in 1817, under the title of Fresh Gleanings; or, a New Sheaf from the Old Fields of Continental Europe. This work appeared with the pseudonym of "I. K. Marvel," which the author has since retained. He visited Europe during the revolutionary movement of 1818, which suggested his next book, The Battle Summer, which came out in 1849. The next year he published anonymously, The Lognette, a mild social satire. In the same year appeared his Reveries of a Bachelor, his most successful book, and which has been trans-
Mitchell.

Mitchell.

lized into French. In 1851 he published *Dream-Life, a Fable of the Seasons*. In 1853 he was appointed U. S. consul at Venice, whence he returned in 1855, and has since lived in a farm at Edgewood, near New Haven. This farm he has made the subject of two of his books, *My Farm of Edgewood, 1863*, and *Wild Days at Edgewood, 1864*. His later publications are *Seven Stories*, 1865; *Doctor Johns*, a novel, which was originally published in the *Atlantic Monthly*; and *Rural Studies*, 1867. This style is modeled upon that of Washington Irving, and though sufficiently graceful, is sometimes felt to lack relief.

MITCHELL, Enslin, B.D., 1792-1857; b. Conn.; graduated at Yale college in 1813; was tutor there 1816-18; professor of mathematics in the university of North Carolina in 1817-25, and afterwards of chemistry; was ordained in the presbyterian church in 1821. He was for some time state surveyor. In 1835 he ascended the Black mountains of North Carolina, and ascertained that they were the highest in the United States east of the Rocky mountains, estimating the principal peak, Clingman's peak, to be 6,476 ft. above the sea. In 1844 he again made the ascent, and made the height 6,662 ft. This being disputed, he made a third ascent in 1857 of one of the heights, and was killed by a fall from a precipice. He was buried on its summit. This is called in North Carolina Mt. Mitchell, or Mitchell's high peak.

MITCHELL, John, b. England; a physician who settled at Urbana, Va., about 1760, and gained recognition as a botanist, and after whom the *Mitchelli repens* was named by Linneaus. In 1755 he prepared a map of the British and French dominions in North America; and he also wrote, among other papers that attracted general attention, *The Contest in America between Great Britain and France*, and an essay on *The Causes of the Different Colors of People in Different Climates*. After his death in London in 1793, a manuscript written by him on the yellow fever in Virginia in 1792, came into the possession of Benjamin Franklin, and was found of much service by Dr. Rush of Philadelphia in his experiments in the epidemic of 1793.

MITCHELL, John L., b. Penn.; 1837; was educated at the university at Lewishburg, in Union co., Penn.; and, graduating in 1858, read law and was admitted to the bar. At the outbreak of the rebellion, he enlisted in the 139th Pennsylvania volunteers, and was promoted to the rank of captain. After the close of the war, he settled at Wellsboro, Tioga co., Penn., and practiced law. In 1885 he was district-at-tenant of the county, and having served his term, was, in 1874, elected a member of the Pennsylvania house of representatives. He was chairman of the judiciary committee, served continuously until 1876, and became the recognized leader of the republican party in the house. In 1876 he was elected a member of congress, and was re-elected in 1878, but declined a renomination in 1880. In Feb., 1881, he was elected a member of the U. S. senate for Pennsylvania, after a bitter and protracted contest, in which a number of the most prominent men in the state were candidates.

MITCHELL, John Kearley, 1796-1858; b. Va.; educated at the university of Pennsylvania, and, after making three voyages to China as surgeon of a ship, began to practice medicine in Philadelphia. In 1824 he lectured on medicine and physiology at the Philadelphia institute, where he became professor of chemistry in 1826. He accepted the chair of the theory and practice of medicine at the Jefferson medical college in 1841. Besides many contributions to scientific periodicals he published: *Saint Helena, a Poem by a Yankee, 1831; Indecision and other Poems, 1839; On the Cryptogamous Origin of Mularious and Epidemic Fevers, 1849;* and a collection of his essays appeared in 1858.

MITCHELL, Maria, b. Mass.; 1818; of Quaker parents. Her father, a school-teacher in Kentucke, gave much attention to astronomy, in which his daughter at an early age became greatly interested. She devoted study especially to nebulae and comets; and in 1847 she published an account on the discovery of a new telescopic comet, for which she received from the king of Denmark a gold medal. During the next ten years she was employed by the coast survey, and assisted in compiling the nautical almanac. In 1857 she traveled in Europe, visiting the principal observatories and astronomers; and in 1865 she became professor of astronomy in Vassar college. Miss Mitchell is a member of the American association for the advancement of science, and also of the American academy of arts and sciences, of which she was the first female member admitted. A short biography of her may be found in *Woman’s Record of Distinguished Women*, by Mrs. Sarah J. Hale.

MITCHELL, Nathan, 1769-1853; b. Mass.; a descendant of Experience Mitchell, one of the founders of the first New England settlement; graduated at Harvard, class of 1789; was a teacher in early youth, and having studied law was admitted to the bar in 1792, and commenced practice in his native town, East Bridgewater. In 1811 he was appointed justice of the circuit court of common pleas for the s. circuit, and in 1819 chief-justice, holding the office for two years. He was highly esteemed in the community, and by members of the profession in his native state and in Maine, and was placed in many responsible positions. In 1798, and for several consecutive sessions, he was elected representative to the general court; member of congress 1803-5, state senator 1813-14, and member of the executive council 1814-20. In 1839 he was again elected to the general court, this time from Boston, to which city he had removed. In 1837 he was
chairman of the railroad commission which surveyed the route of the Boston and Albany railroad. He was at one time librarian and treasurer of the Massachusetts historical society, and was for some years president of the Bible society of Plymouth county. Endowed with musical talent of a high order and a passion for the art, associated with Mr. Bartholomew Brown he published The Bridgewater Collection of Sacred Music, for many years the standard musical publication of New England, the sale reaching 100,000 copies. In 1840 he published History of the Early Settlement of Bridgewater, with genealogical tables, the first American publication of the kind.

MITCHELL, Peter, Hon., b. New Brunswick, 1824; educated in his native place of Newcastle, served his county two terms (5 years) in the provincial parliament, entering public life in 1836, and was appointed life-member of the legislative council. He became a member of the executive government of New Brunswick in 1858 in the discontented political condition of the British American provinces in relation to the relative political influence in Canada, and in 1864 suffered defeat with his government, which favored by a large majority a federal union of the whole of British America from the Atlantic to the Pacific, including Prince Edward's Island and Newfoundland, which latter, however, refused to co-operate. He was appointed delegate to Canada and England on this subject and that of the Intercolonial railway from Halifax to Quebec. In 1865, associated with the hon. R. D. Wilmot, mayor of St. John's, he formed an administration in order to test the opinion of the province on the question of confederation, and was president of the executive committee. When the vote was taken, confederation was carried 33 to 8. He was an ardent promoter of British union, and rendered essential service by his writings and public speeches. In July, 1867, he was given the position of minister of marine and fisheries in the cabinet of the Dominion government.

MITCHELL, S. Weir, M.D., b. Philadelphia, 1829; educated at Jefferson medical college. He has since practiced in Philadelphia, making a specialty of nervous diseases. Among his writings are: Injuries of the Nerves; Nurse and Patient; Fat and Blood; and two volumes of magazine stories.

MITCHELL, Samuel Augustus, 1792-1868; b. Conn.; a writer on geographical subjects; passed his childhood in Connecticut, and removed to Philadelphia, where he labored 40 years in cosmographical research. He prepared textbooks of geography for the use of schools, maps and treatises considered superior to all others of their date. In 1846 he published General View of the World; in 1851, Universal Atlas, 76 sheets, forming a series of 130 maps, plans, and sections; in 1852, Pocket Maps, 55 in number,—in all 24 works, 400,000 copies of which have been sold in one year.

MITCHELL, Sir Thomas Livingstone, D.C.L., 1792-1855; b. Scotland; son of John Mitchell. His family altered its name of Mitchell upon its intermarriage with the Livingstones. Thomas Mitchell began his service in the British army in the Portuguese campaign of 1808, and at the close of the peninsular war had been promoted maj. He was then sent to make surveys and plans of the peninsular battle-fields. In 1827 he published Outlines of a System of Surveying for Geographical and Military Purposes, and was made deputy surveyor-general of New South Wales. Besides the routine work of this office, he led a number of exploring expeditions into the interior of Australia. In 1831-32 he discovered the Bell river and the Namoi. In 1835 he traced the course of the river Darling, which he followed, in 1836, as far as the Murray river, with which it unites. In the same expedition he followed the Glenelg river to the ocean. He gave the world the results of his explorations in his Three Expeditions into the Interior of Eastern Australia, etc., which appeared in 1838. He came to England to take charge of this work and of his Map of the Colony of New South Wales in their passage through the press, and on the occasion of this visit was knighted. He also received the degree of D.C.L. from Oxford, and was elected to the royal and the geographical societies. On his return to Australia he conducted a fourth exploring expedition, in which he reached 21° 30' south. He followed the Victoria river, which he was the first to find and name, but which he named after Carpentaria, probably as far as its mouth, and then, in his boat, 1842, from a continued drought. In 1850 he published a school geography for use in New South Wales under the name of Australian Geography. His next publication was an account of a new steam propeler which he had invented on the principle of the boomcrang. This work was published as the The Origin, History, and Description of the Boomcrang Propeller. In 1854 he was made a col.

MITCHELL'S PEAK. See Black Mountains, ante.

MITCHELL, Samuel Latham, M.D., 1764-1831; b. Long Island, N. Y.; graduated doctor of medicine in 1786 in the university of Edinburgh; returned to America in 1787, and studied law for three years; was appointed in 1792 professor of chemistry, natural history, and philosophy in Columbia college. He had at this time a controversy with Dr. Priestley in reference to some of Lavosier's principles. In 1796 he made a geological and mineralogical tour along the Hudson. In connection with Dr. Edward Miller and Elisha H. Smith he established the quarterly Medical Repository, of which he was for 16 years the editor. He was a member of the legislature in 1801; twice a representative in congress, in 1801-4 and 1810-13; and in 1804 U. S. senator. In 1808 he became professor of natural history in the college of physicians and surgeons; and in 1829 of botany
The name Mite, a name sometimes given to the *Acari* generally (see Acars); sometimes only to those of them which have the feet formed for walking, and the mouth not furnished with a sucker formed of lancet-like plates, as in the ticks (q.v.), but with mandibles. All of them are small creatures; the species are very numerous; they feed chiefly on decaying animal and vegetable substances, or are parasitical on quadrupeds, birds, and insects. The Chigger *Mite* (deres domestica) is one of the best-known species; another is the Flower *Mite* (G. furinae), too common among flour, in both of which the body is covered with hairs very large in proportion to its size, and capable of a considerable amount of motion. The Sugar *Mite* (*A. suclayhinius*) swarms in almost all soft sugar; but refined and crystalized sugar seems to defy its mandibles, and is free of it. The surface of jelly and preserves, when it has begun to become dry, is often covered with multitudes of very small mites. A species of *mite* is the cause of itch (q.v.); and many of the lower animals are infested by parasites of this tribe. Beetles may often be seen absolutely loaded by a species which preys on them; and bird-fanciers regard with the utmost horror the Red *Mite*, which lurks in crevices of cages and aviaries, and sucks the blood and eats the feathers of their inmates.

**MITFER**,

the point or line of union of moldings meeting at an angle.

**MITFORD,** Mary Russell, a well-known English authoress, was the only child of a physician, and was b. at Alresford, Hants, Dec. 16, 1786. At the age of ten she was sent to a boarding-school at Chelsea, and also placed under the guidance and tuition of a Miss Rowden, a lady of a literary turn, who had already educated Lady Caroline Lamb, and was destined to be the instructress of Miss Landor and of Fanny Kemble. During the five years she spent there she read with avidity, studying the tragic authors of France, Shakespeare, and the early dramatists of England. At the age of 15 she returned home, and before she was 20 she published three volumes of poetry. These having been severely castigated by the *Quarterly Review*, she applied herself to writing tales and sketches for the magazines. The profession she had adopted from taste she was obliged to continue from necessity, for the spendthrift habits of her father, a good-natured but careless gentleman, had exhausted a competent fortune, and left him dependent on his daughter. The first volume of *Our Village* appeared in 1824, and the series of five volumes was completed in 1829. Of the more important of her dramatic works, *Julian* was first performed in 1823; the *Fuscari* in 1826; and *Brienz* in 1828—all of them, and especially the last, with success. Among her other important works are *Recollections of a Literary Life* (3 vols. 1852); *Atherton and other Tales* (a novel, 3 vols. 1854); and in 1854 she also published a collected edition of her dramatic works, in two volumes. In 1838 she received a pension from government, but neither this nor the growing ill-health of her later years induced her to relax her literary industry. She died at her residence, Swallowfield cottage, near Reading, Jan. 10, 1855.

Successful both as a compiler and an author, Miss Mitford has produced many interesting volumes; but her fame—if the admiring respect for an amiable lady and a woman of graceful literary genius may be so called—rests chiefly on the sketches of country life which compose *Our Village*. These sketches are chiefly memorable for their style, which, if not witty, is vivacious, genial, and humorous; the outcome at once of a good heart, an active brain, and a fine fancy.

**MITFORD,** William, was b. in London, Feb. 10, 1744, and studied at Queen's college, Oxford, but left the university without taking his degree. In 1761 he succeeded to the family estate; and in 1769 became acapt. in the South Hampshire militia, in which capacity he made the acquaintance of Gibbon, then a maj. of the same, by whose advice and encouragement he was induced to undertake a history of Greece. Mitford's first work, entitled *An Inquiry into the Principles of Harmony in Languages*, and of the *Mechanisms of Verse*, Modern and Ancient, appeared in 1774; but by far his most important publication was his *History of Greece*, the first volume of which appeared in 1784, and the last in 1818. It is a pugnacious, opinionative, one-sided, and even fanatical production. The author is an intense hater of democracy, and can see in Philip of Macedon nothing but a great statesman, and in Demosthenes nothing but an oratorical demagogue. Yet his zeal, which so often led him astray, also urged him, for the very purpose of substantiating his views, to search more minutely and critically than his predecessors into certain portions of Greek history, and the consequence was that Mitford's work held the highest place in the opinion of scholars until the appearance of Thirlwall and Grote. He died Feb. 8, 1837.

**MITHRAS** (cf. Sanskrit Mitram, friend), the highest of the twenty-eight second-class divinities of the ancient Persian pantheon, the Zoro, Zend, Yazata, or genius of the sun, and ruler of the universe. Protector and supporter of man in this life, he watches over his soul in the next, defending it against the impure spirits, and transferring it into the

and materia medica. He was vice-president of Rutgers medical school in 1826-30. He was somewhat eccentric. He proposed to have the name of this country changed to Fredonia, and in 1804 wrote *An Address to the Freddo People of the United States*. He published the following works: *Observations on the Absorbent Tubules of Animal Bodies; Nomenclature of the New Chemistry; Life, Explosive, and Precepts of Tammony, the famous Indian Chief*; *Synopsis of Chemical Nomenclature and Arrangement*.
Mithridates.

Mithridates (more properly, Mithridates, a name formed from the Persian Mithras, or Mithra, "the sun," and an Aryan root ha, to give; hence "sun-given" or "sun-born" prince), the name of several kings of Pontus, Armenia, Commagene, Parthia, and the Bosporus, all of whom have sunk into insignificance, with the exception of Mithridates VI. of Pontus, grandson of Eudoxus and still more generally known as Mithridates the Great. Little is known of him of his boyhood. He succeeded his father, probably about 120 B.C. while under 13 years of age, and soon after subdued the tribes who bordered on the Euxine, as far as the Chersonese Taurica (Crimea), and after the death of Parysatis, incorporated the kingdom of the Bosporus with his dominions. The jealous behavior of the Romans, and the promptings of his own ambitious spirit, now incited him to invade Cappadocia and Bithynia, but a whole-some fear of the power of the Great Republic induced him to restore his conquests. The First Mithridatic War was commenced by the king of Bithynia (88 B.C.), who, at the instigation of the Romans, invaded Pontus. Mithridates sent an ambassador to Rome to complain of this treatment, but he was sent back with an evasive reply. Mithridates immediately commenced hostilities, and his generals repeatedly defeated the Asiatic levies of the Romans, and he himself took possession of Bithynia, Cappadocia, Phrygia, and the Roman colonies in Asia Minor, the inhabitants of which last hailed him as a deliverer. By his orders, a great massacre of the Romans took place, in which, according to one account, 80,000, and according to another 150,000 were slain. He also sent three powerful armies to aid the Greeks in their rebellion, but the disastrous battles of Chaeronea and Orchomenus broke his power in that country. He was, however, driven from Pergamus (85 B.C.) by Flavius Pimbria, and reduced to the necessity of making peace with Sulla, relinquishing all his conquests in Asia, giving up 70 war-galleys to the Romans, and paying 2,000 talents. The wanton aggressions of Murena, the Roman legate, gave rise to the Second Mithridatic War, in 83 B.C. Mithridates was wholly successful in this war, but peace was concluded on the status quo, 81 B.C. Mithridates felt, however, that this was merely a truce, and lost no time in preparing for a third contest, in alliance with Tigranes, king of Armenia, the next most powerful monarch of Asia. Tigranes seized Cappadocia, 76 B.C., and Mithridates, in the following year, invaded Bithynia, commencing the Third Mithridatic War. Mithridates formed an alliance with Sertorius (q.v.), and obtained the services of Roman officers of the Parthian party, who trained his army after the Roman manner. The arms of Mithridates were at first successful; but afterward the Roman consul Lucullus (q.v.) compelled him to take refuge with Tigranes, 72 B.C. Lucullus then conquered Pontus, defeated Tigranes, 69 B.C., at Tigranocerta, and both Tigranes and Mithridates at Artauxata, 68 B.C. Mithridates, however, recovered possession of Pontus. After the war had lingered for some time, Cneius Pompeius (see Pompey) completed the work of Lucullus, 66 B.C., defeating Mithridates on the Euphrates, and compelling him to flee to the Bosporus. Here his indomitable spirit prompted him to form a new scheme of vengeance, which was, however, frustrated by the rebellion of his son, Pharnaces, who besieged him in Ponticapanum. Deeming his cause hopeless, Mithridates put an end to his own life, 63 B.C. Mithridates was a
specimen of the true eastern despot, but he possessed great ability, and extraordinary energy and perseverance. His want of success was owing not to his defects as a general, but to the impossibility of raising and training an army capable of coping with the Roman legions, and his system of tactics during the third Mitridatic war plainly shows his thorough conviction of this fact. He had received a Greek education at Sinope, could speak no less than 25 different languages and dialects, and possessed considerable love for the arts, of which his magnificent collections of pictures, statues, and engraved gems were a proof. In the estimation of the Romans, he was the most formidable opponent they ever encountered, and occasional reports of his various successes spread the utmost terror among them.

MITLA, a city in s.e. Mexico, on the plain of Mixteca-pa, 15 m. s.e. of Oaxaca. The region is inhabited by the Zapoteco race, and is a city of ruins (Aztec, Mixtan, place of the dead). No positive information has been obtained as to the builders, but it is thought that its extensive ruins of monuments and edifices were the work of the progenitors of the present inhabitants. Its ruined palaces and temples, adorned with artistic sculpture, are well preserved, many roofs being supported by columns. In 1860, in a publication entitled Charnay's Reliques Américaines, there appeared a collection of photographs of these ruins.

MITRAILLEUSE, a machine-gun in which 37 or more large-bored rifles are combined with breech action, by means of which a shower of bullets may be rapidly projected by one man. It was invented in Belgium, and adopted by the French emperor Napoleon after the Prussian-Austrian war of 1866. It was the chief cannon of the French artillery service in the Franco-German war of 1870. The mitrailleuse was invented in the primitive form as early as the 14th c., and well-preserved specimens may be found in the arsenals and museums of Vienna, Rome, Berlin, Moscow, and Constantinople.

MITRE (Lat. mitra, also infima), the head-dress worn in solemn church services by bishops, abbots, and certain other prelates in the western church. The name, as probably the ornament itself, is borrowed from the orientals, although, in its present form, it is not in use in the Greek church, or in any other of the churches of the various eastern rites. The western mitre is a tall, tongue-shaped cap, terminating in a twofold point, which is supposed to symbolize the "cloven tongues," in the form of which the Holy Ghost was imparted to the apostles, and is furnished with two flaps, which fall behind over the shoulders. Opinion is much divided as to the date at which the mitre first came into use. Eusebius, Gregory of Nazianzus, Epiphanius, and others speak of an ornamented head-dress, worn in the church; but there is no very early monument or pictorial representation which exhibits any head-covering at all resembling the modern mitre. From the 9th c., however, it is found in use, although not universally; and instances are recorded in which the popes grant permission to certain bishops to wear the mitre; as, for example, Leo IV., to Anshar, bishop of Hamburg, in the 9th century. The material used in the manufacture of the mitre is very various, often consisting of most costly stuffs, studded with gold and precious stones. The color and material differ according to the festival or the service in which the mitre is used, and there is a special prayer in the service of the mitre for the bishop in investing the new bishop with his mitre. The mitre of the pope is of peculiar form, and is called by the name tiara (q.v.). Although the mitre properly belongs to bishops only, its use is also permitted by special privilege to certain abbots, to provosts of some distinguished cathedral chapters, and to a few other dignitaries. See Binterim, Denkwürdigkeiten der Kirche, 1 B 2 Th., p. 348.

The mitre, as an ornament, seems to have descended in the earliest times from bishop to bishop. Among the Cotonian MSS. is an order dated July 1, 4 Henry VI., for the delivery to archbishop Chicely of the mitre which had been worn by his predecessor. It was in some cases a very costly ornament. Archibishop Pechenh's new mitre, in 1888, cost £1,734 4s. 1d. In England, since the reformation, the mitre is no longer a part of the episcopal costume, but is placed over the shield of an archbishop or bishop, instead of a crest. The mitre of a bishop has its lower rim surrounded with a fillet of gold; but the archbishops of Canterbury and York are in the practice of encircling theirs with a ducal coronet, a usage of late date and doubtful propriety. The bishop of Durham surrounds his mitre with an earl's coronet, because of being titular count palatine of Durham and earl of Selby. Before the custom was introduced of bishops impaling the insignia of their sees with their family arms, they sometimes differentiated their paternal coat by the addition of a mitre. Mitres are rare as a charge in heraldry, but are sometimes borne as a crest, particularly in Germany, to indicate that the bearers were feuclatories, or dependencies of ancient abbey.

MITRE, BARTOLOME, b. Buenos Ayres, 1821; became an instructor in a military college in Bolivia in 1846 and also a journalist; was next engaged as an officer in the Bolivian army in a war against Peru; then successively as editor, politician, and finally military leader again in the movement of Buenos Ayres against gen. Urriza in 1852, which resulted in the quasi independence of that province from the Argentine confederation. After returning to peaceful pursuits, he wrote the Historia de Belgrano. In 1860, after the re-union of the seceded province to the Argentine confederation, he was chosen governor of Buenos Ayres; and in 1862, when new difficulties with the federal
government had brought into existence the Argentine republic in place of the confederation, Mittermaier was elected president for six years. He was also a candidate again in 1874, but was defeated; after which he headed a rebellion that proved disastrous to his fortunes. Since then he has lived in retirement.

MITTRE SHELL. A name applied to the shells of several species of mitra, a genus of gastropods belonging to the family olvadilic (q.v.). The shells are very beautiful and much prized by collectors, the favorite being the bishop’s mitre shell, of the species M. episcopalis. In the genus mitra the shell is fusiform, thick, spire elevated, acute, aperture small, notched in front; columella obliquely plaited; operculum very small. The animal has a very long proboscis; and, when irritated, emits a purple liquid having a very offensive smell. The eyes are situated on the tentacles or at their base. Over 40 recent and 100 fossil species have been described. In M. episcopalis the animal has a narrow foot, compressed and channeled at its root, nearly square and slightly articulated in front, with a marginated furrow, and pointed behind; eyes sessile at the base of the tentacles. The proboscis is twice the length of the shell. The shell is turrited, smooth, white, spotted with bright red; pillar, four plaited; outer lip denticulated at its lower part; epidermis thin. It is found in East Indian seas and islands of the South. M. adelata has a fusiform shell, turrited, ornamented with longitudinal reddish-brown spots; strie transverse, impressed, rather remote and dotted; pillar fine plaited. It is found at Timor, Vanikoro. There are two varieties. The different species are found at depths varying from the surface to 17 fathoms, on reefs, sandy mud, and sand. They are all inhabitants of warm countries.

MITSCHERLICH, Eduard, a distinguished Prussian chemist, was b. at Neuenode, near Jenae, in 1794, and d. at Berlin in 1863. In 1814 he proceeded to the university of Heidelberg, where he devoted himself to history, philology, and oriental languages; and he became one of the leaders of the lads of Göttingen and Paris. In 1829, when he was then at the last-named university (1814 or 1815) he first directed his attention to geology, mineralogy, and chemistry, and it was not till 1818, when he was at Berlin, that he selected chemistry as his special study. His observations on the striking similarity between the crystalline form and the chemical composition of the arseniates and the phosphates led to his discovery of the law of isomorphism (q.v.), the importance of which was so fully recognized by Berzelius that he invited the young chemist, in 1819, to Stockholm, where he studied till 1821, when, on the death of Klaperoth, he was, on the strong recommendation of Berzelius, appointed to the vacant chair of chemistry at Berlin. One of his earliest discoveries after his appointment was that of the double crystalline form of sulphur, the first observed case of dimorphism. See Dimorphous. His investigations regarding the formation of artificial minerals, and his memoirs on benzine and on the formation of ether must be classed among his most important contributions to chemistry; but it is mainly on the discovery of isomorphism and dimorphism that his reputation will finally rest. His principal work is his Lehrbuch der Chemie, begun in 1829, and concluded in 1841. It has passed through five editions, and is especially valuable for the clear and simple way in which he has brought mathematics and physics to bear upon the subject. He was an honorary member of almost all the great scientific societies, and received the gold medal from the Royal Society of London for his discovery of the law of isomorphism.

MITTAU, or MITAU, the chief t. of the government of Courland, in European Russia, is situated on the right bank of the Aa, 25 m. s.w. of Riga, and was founded in 1271, by the grand master of Teutonic Knights. It was annexed to Russia in 1795. Pop. '67, 23,100, the majority of whom are Germans by birth or descent, 1000 are Jews, and only a few Russians. The town is indifferently built, the houses being chiefly of wood and painted of a green or brown color. The most important buildings are the old castle—now the seat of the governor of the province, four churches, an astronomical observatory, a public library, a museum, and a number of educational and charitable institutions. As regards commerce and industry, the town occupies only the third place in the government, its principal product being articles of jappanned iron and tin; there is an export trade in hemp, flax, and corn. Mitau is the winter residence of the gentry of the surrounding country, and was for some time the abode of Louis XVIII.

Mittermaier, Karl Joseph A. T., 1787-1867, b. in Munich, Bavaria; educated at the universities of Landshut and Heidelberg; for two years in 1819-21, he was a professor at Bonn, but the rest of his life was passed teaching law and jurisprudence at Heidelberg, with the exception of the time occupied as representative of Baden at the provisional Frankfort parliament and occasional pleasure-trips in Italy, which last occasioned his Italienische Zustände, a criticism of Italian affairs. In politics Mittermaier was liberal, but would now be considered almost conservative by the radical party. For 20 years, 1820-40, he was a member of the Baden legislature. His greatest claim to distinction, however, lies in his extensive writings on jurisprudence, among which is a complete manual of criminal law, Lehrbuch des Criminal-processes; and he was an earnest advocate of reform in the German criminal procedure and in prison discipline. The number of his published writings is very large, including many treatises on branches of law, discussions on all the important questions of his time connected with jurisprudence, and especially on trial by jury and the penal code. He also published a transla-
tion of Francis Lieber's Letter on Anglican and Gallican Liberty, and edited the German translation of the same author's Civil Liberty.

MITTIMUS, an English law-tern for a writ by which a record is tranferred out of one court into another.

MITTIMUS (utsche), in criminal practice both in England and in the United States, is a written mandate issued by a competent judicial officer, enjoining an officer of the law to safely convey the body of a prisoner to some place of imprisonment; and also commanding the keeper of such jail to receive and retain the prisoner for a certain time, or until released in course of law. A mittimus is more commonly called a commitment. The document must be issued in the name of the people or of the magistrate, must be dated, is usually sealed, and must describe with reasonable certainty the name or, if not known, the person of the accused, and the criminal offense with which he is charged. Technical nicety in the language of the mittimus is not necessary. The precept passes to the jailer, who is bound to receive the prisoner, and may be indicted for refusal, in which case the officer is bound to retain custody of the accused. It has been held, where a mittimus had been granted on evidence by a justice of the peace, and it was handed to the accused person with the request that he would carry that note to the jailer, and he, in ignorance of its nature, did so, that his detention was in all respects legal.

MITTOO, a country of central Africa, bounded n. by the territory of the Dinka, s. by that of the Nyamnyam, and lying between the Rohl and Roha rivers. The soil is fertile, producing various cereals, tuberous plants, and leguminous and oily fruits, without much labor. The wearing of iron and copper ornaments is common to both sexes, and both are fond of chains for fastening trinkets to their bodies. A thick iron chain on the neck indicates wealth, and some wear four of them. The people have goats and poultry, but no cattle; they eat the flesh of dogs, and are in contempt called Dyoor, or savages. In war they use bow, arrow, and spear, but not shields.

MITT WEIDA, a t. of Saxony, in the circle of Zwickau, 35 m. s.e. of Leipzig. For centuries Mittweida has been noted for its industry. The principal branches of industry are spinning, cotton-weaving, manufacture of fustian, etc., together with dye-works and bleach-fields. Pop. 75, 9,093.

MITYLENE. See Lesvos.

MIXED CADENCE, in music, is a peculiar way of concluding a musical period or passage, which differs from the perfect, imperfect, and plagal cadence. The mixed cadence, which is most frequently used, consists of the sub-dominant harmony followed by that of the dominant.

MIXED MARRIAGES. In various countries of Europe, marriages between persons of different religious belief have either been prohibited or put under restrictions. The canon law forbade marriages between Christians and non-Christians; at one time, it merely discouraged, at another altogether prohibited the marriage of orthodox Christians with heretics. Subsequently to the reformation, papal dispensations were in use to be granted by the clergy in cases of marriages between Catholics and Protestants, on the condition annexed, that the children should be brought up in the Catholic faith. During the latter part of the 17th c., parents seem to have been left at liberty to make what agreement they pleased on this head; and in default of their making any, it was presumed that the children would follow the religion of their father. In the middle of the 18th c., the validity of mixed marriages, even when celebrated by the civil magistrate, was recognized by the papal court; and under Napoleon's rule, they became common, without stipulations as to the children. The events of 1815 restored sufficient influence to the Roman Catholic church to enable the clergy to put in force a rule by which they could refuse to celebrate such marriages without an assurance that the children would be brought up Catholics. By the law of many of the German states, the clergyman of the bride was the only person who could competently officiate, and an engagement of this kind was often not only repugnant to the father as a Protestant, but illegal. Conflicts followed between the civil and ecclesiastical authorities, which have sometimes been obviated by the priest, on occasion; but besides the celebration of the marriage, not pronouncing the nuptial benediction, but giving his presence as a witness along with two other witnesses when the parties declared themselves husband and wife—a kind of marriage whose validity is perfectly recognized by the canon law. In Spain, marriages between Catholics and Protestants have sometimes taken place in this way, avoiding the stipulations otherwise necessary regarding the children.

There was, till lately, a great diversity in the state of the law of mixed marriages in different parts of Germany. Prussia was the first state to do away the former restrictions by the recognition of a civil ceremony alone as that which constitutes marriage in the eye of the law. Until that change, the letter of the law provided that the children should be brought up in the faith of their father, and no compacts to the contrary were allowed. Practically, however, the law was largely evaded, no one having a recognized interest to object to the fulfillment of such agreements. In Bavaria, mixed marriages might be performed either by Protestant or Catholic clergymen; and the spouses left it in their power to make what arrangements they pleased regarding the children before or after marriage; but if no such arrangements happened to have been made, the children
were brought up in the religion of their father. In Saxony, and various other German states, the spouses might, before marriage, make what arrangements they liked as to the religion of their children; but if they had made none, the law obliged them to be brought up in the faith of their father. A bill for rendering civil marriage obligatory throughout the empire was brought before the Reichstag in 1874, and passed in 1875, thus extending the system of Prussia to all other German states. This bill enables men and women to be married independently of the consent of the clergy (not always easily obtained in Catholic districts), or of the difference of their religious beliefs. It also allows of children being left unbaptized, and brought up without being assigned to any religious denomination whatsoever. In Austria, the interposition of the Catholic priest is required in marriages between Catholics and Protestants. He need not, however, give the sacerdotal benediction; his passive assistance only is required, either in taking the declaration of the marriage vows, or in the presence of the priest at the Protestant ceremony. When the husband is Catholic, all the children must be brought up Catholics; when the husband is Protestant and the wife Catholic, the sons follow the father and the daughters the mother. In Denmark stipulations may be made before or after marriage, and can be altered by mutual consent of the parents, or, in some cases, even after the death of one of them. Mixed marriages were, till lately, altogether prohibited in some of the Catholic cantons of Switzerland, but they are now authorized in all the cantons by the federal laws. It is generally the clergyman of the husband's creed who officiates, but at Zürich the ceremony is performed in both churches. In most cases, the children are required to be educated in the religion of their father.

In most German states, marriages between Christians and Jews or Mohammedans used to be interdicted; but, after 1849, the prohibitions were in individual cases dispensed with. In Denmark mixed marriages have been permitted on condition of the children being brought up as Protestants. In Russia the members of both Greek and Roman communions are prohibited from intermarrying with non-Christians; members of the orthodox Greek church cannot marry Greek sectaries; but when an orthodox Russian marries a Protestant or Catholic, the benediction must be given in the Greek church, and the children baptized in the Greek communion. When the parents are of different religions, but neither belongs to the Greek church, ante-nuptial stipulations will be given effect to; if none have been made, the sons follow the father's faith, and the daughters the mother's.

In France the law regards marriage as a purely civil contract, and recognizes only the civil celebration, which is completely separated from the religious rite. As the faith of the parents is not taken cognizance of, questions regarding the religious education of the children cannot arise before the civil tribunals.

The only restriction to which mixed marriages are now subjected in any part of the United Kingdom is imposed by act 19 Geo. II. c. 13, applicable to Ireland only, that a marriage celebrated by a Catholic priest between a Roman Catholic and a Protestant, or a person who within 12 months has been or professed to be a Protestant, or between two Protestants, is null.

**MIXED MATHEMATICS**, a name given the purely scientific principles of mathematics when applied and intermixed with physical considerations. Such are hydrostatics, optics, and navigation.

**MIXED RACES.** The subject of mixed races is one intimately connected with an enlarged study of ethnology. It involves a consideration of the phenomena attendant upon the sexual union between individuals belonging to different varieties of the human race; as, for instance—adopting the classification of Blumenbach—between the European and the negro or the American Indian; or between the American Indian and the negro; or between any of these three and individuals belonging to the Malay and Mongolian varieties. It is well understood that such unions are in general prolific; and not only so, but that their offspring is likewise prolific; and this fact is much relied upon by some ethnologists as an argument in favor of the unity of the human race. They reason thus: Were the different varieties of mankind distinct species, as has been frequently alleged, then it would necessarily follow that the offspring of such unions would prove as unfruitful as those between the horse and the ass, the goat and the sheep, the wolf and the dog; and similarly with respect to the hybrids among birds, insects, and plants. To sum up, in the words of Dr. Pritchard, the best exponent of this school of ethnology: "It seems to be the well-established result of inquires into the various tribes of organized beings, that the perpetuation of hybrids, whether of plants or animals, so as to produce new and intermediate tribes, is impossible. Now, unless all these observations are erroneous, or capable of some explanation that has not yet been pointed out, they lead, with the strongest force of analogical reasoning, to the conclusion that a number of different tribes, such as the various races of men, must either be incapable of intermixture in their stock, and thus always failed to remain separate from each other, or, if the contrary should be the fact, that all the races to whom the remark applies, are proved by it to belong to the same species." Dr. Pritchard further observes, that so far from such unions between members of different varieties of the human race proving unfruitful, or their offspring unfruitful, the very opposite is the case, as, for instance, in unions between the negro and the European, the most strongly marked varieties of our race. "If we inquire,"
he says, "into the facts which relate to the intermingling of negroes and Europeans, it will be impossible to doubt the tendency of the so-called mulattoes to increase. The men of color, or the mixed race between the creoles and the negroes, are in many of the West Indian islands a rapidly increasing people, and it would be very probable that they will eventually become the permanent masters of those islands, were it not for the great numerical superiority of the genuine negroes. In many parts of America they are also very numerous." It is to America, indeed, both north and south, that we must chiefly look for the numerous and varied phenomena resulting from this intermingling of races; for there we have not only the negro and the European mingling their blood, but the negro and the American Indian, the European and the Indian, and the offspring of each of these with the offspring of the other, or with members of either of the parent stocks; added to which, of late years, the Chinese (of Mongolian race or variety) have appeared upon the scene, thus contributing greatly to the number of what are termed human hybrids. All these, however, are not equally fertile; and with respect even to the mulattoes, it is alleged by writers of the Morton school of ethnology that they do not perpetuate themselves for many generations. "Nature," says Squier, rather dogmatically, "perpetuates no human hybrids—as, for instance, a permanent race of mulattoes." And Dr. Nott, adopting the classification of species laid down by Dr. Morton—namely, remote species, in which hybrids are never produced; allied species, which produce, inter se, an unfertile offspring; and proximate species, which produce with each other a fertile offspring—is of opinion that it is only by the union of southern or dark-skinned Europeans with negroes in the south that prolific mulattoes are ever produced, which is not the case in unions occurring between individuals of the Anglo-Saxon and negro races. In arriving at this conclusion, we cannot help thinking that the author has been helped forward by the strong prejudice existing in the southern states against all taint of negro blood. A more impartial writer, prof. Wilson, in his Prehistoric Man, observes: "There are upwards of 4,000,000 of people of African blood in the United States, and certainly not less than 10,000,000 throughout the continent and islands of North and South America, and of these the larger proportion consists of hybrids." It is impossible to determine with certainty how far the hybrid colored population of the United States is capable of permanency, either by the development of a fixed hybrid type, or by continuous fertility, until the predominant primary type reasserts its power, by their return to that of the original white or black parent, so long as the mixed breed is constantly augmented in the southern states by means at variance with the natural and moral relations of social life. As it is, the sight of evidence in favor of Dr. Prichard's views; but, until the doctrine of hybridity is better understood, and a more satisfactory answer to the vexed question, "What is species?" has been supplied to us, we must deem it idle to pronounce dogmatically on the subject. See HYBRID and SPECIES. We conclude with a list of half-castes given by Dr. Tschudi, "with a few additions from other sources," printed in the appendix to prof. Wilson's valuable work just mentioned.

MIXTECAS, the name of an ancient Indian race, said to have migrated from the north and settled in Mexico, populating that part of the republic which is now included in the states of Puebla, Guerrero, and Oaxaca. They were an industrious people; were divided into independent bands, each with its own chief; and were inclined towards an advanced state of semi-civilization. They built cities, temples, and fortifications, the remains of which are significant of their capacity and progress. They possessed a relig-
ion, and conducted certain rites in mountain caves, and they included the idea of a heaven, which they named Sosotta, in their theology. This race still exists, retaining a portion of its ancient territory, but has been driven from Puebla by the Mexicans, and in some instances forced to retire into Guatemala. Their language is similar to the Zapotecas, but simpler, although it has a number of dialects. The Mixtecas inhabit a region surrounded by mountain ranges, and are peaceable and industrious, not concerning themselves in the political disturbances which are so frequent in Mexico. Their principal cities are Tepascoluta, Yahnuitlan, Huaxico, and Huajuapan.

MIXTURE, an organ stop, consisting of from two to five ranks of small metallic pipes. It is generally found in large organs, and resembles the sesquiflutes and furniture stops, except that it is much higher and shriller. Like other compound stops, the two smaller ranks of the mixture stop change on the upper part of the organ scale into an octave lower. This is necessitated from the fact that the pipes in their upper ranks would produce too small a volume of sound.

MIXTURES are official preparations, extempore in their nature, some of which—as, for example, mistura camphora, mistura creta, and mistura ferris composita—are very extensively used in medical practice, either as vehicles for more active remedies, or for their intrinsic value.

MIZZEN, or MIZEN, the sternmost of the masts in a three-masted vessel, and also the smallest of the three. Above it are the mizen-topmast, the mizen-top-gallant-mast, and the mizzen-royal. It supports the usual yards, and, in addition, the gaff and boom of the sparker (q.v.). A rear-admiral hoists his pendant at the mizzen.

Although the word mizzen is now applied adjectively to the several parts, it appears formerly to have been the name of a large triangular sail carried in the stern, and thence to have become the distinguishing title of the mast which bore that sail. The name is probably from it, messeta, mean, in the middle; in opposition to a square sail which lies across the vessel.

MNMENOMICS. See Memory.

MNEMONSYNE, in classical mythology the goddess of memory, and the mother of the Muses (q.v.), whom she bore to Jupiter. The principal seat of her worship was at Eleutheria, in Boeotia.

MOA, the name given by the New Zealanders to the large wingless or struthious birds (see BREVIPENNES) of which the bones are found imbedded in the sands of the sea-shore, in swamps, forests, river-beds, and limestone caves, and of which traditions subsist among them as birds living in their country. The largest bones belong to the great bird (Aptornis (q.v.) of Ateleonhys (q.v.), others to Phalagrythe (q.v.); and with them are found bones of a large bird (Aploenas (q.v.)) resembling a swan, supposed to be now extinct, also of the existing species of Apteryx (q.v.) and of Notornis (q.v.), much smaller birds. It is generally supposed that no large moas have been seen alive since about 1650; but it has recently been alleged that some have been seen, and rewards have been offered for the capture of them. They are represented by the New Zealanders as stupid, fat, indolent birds, living in forests, mountain fastnesses, etc., and feeding on vegetable food. Their feet are said to have been adapted for digging. They seem to have been exterminated for the sake of their flesh, feathers, and bones. The eggs were eaten. The leg-bones of the moas were filled, with marrow, and not with air, as those of other birds.

MOABITES, a pastoral people, who inhabited the mountainous country e. of the lower part of the Jordan and of the Dead sea. Their eulutes was characterized by many very odious rites, among which was human sacrifice. In the time of the Judges, the Jews were for eighteen years under the yoke of the Moabites, who were afterwards made tributary by David, but, about 900 B.C., shook off their allegiance to the Jewish kings, and afterwards took part with the Chaldeans against the Jews. Their name no longer exists, and the remnants of the people have long been included among the Arabs.

MOABITES (ante), the descendants of Moab, son of Lot, whose primitive dwelling-place was Zoar, on the south-eastern border of the Dead sea. Gradually supplanting the original Moabites, they obtained possession of the fertile highlands—extending 40 or 50 m. in length by 10 in width on the e. of the Dead sea—and of the plains below. From the most elevated part of this territory they were expelled by the Amorites, who allowed them to retain only the southern half of the table-lands and the plain. This restricted region was strongly fortified by nature, having on the n. the escarpment of the Arnon; on the w. cliffs, almost perpendicular, by the side of the Dead sea, intersected only by a few steep and narrow passes; and on the s. and e. semi-circular hills, through which pass only a branch of the Arnon and the wadys or valleys that go down to the sea. Beyond these hills lay a vast extent of uncultivated pasture-grounds, described in the book of Numbers as the wilderness which faced Moab on the east. Through this Israel seems to have approached the promised land, without traversing Moab itself, but taking their position n. of the Arnon. Here they remained during their operations against Bashan. It was at this time that Balak, king of Moab, in his fear of Israel, sent for Balaam to curse them, and for the Midianites to make war against them. From the plains of Moab Moses ascended to the top of Pisgah to view the promised land; in the land of Moab he died; somewhere in a valley of that land, over against Beth peor, he was buried; and in

U. K. X.—5
the plains of Moab all Israel went for him 30 days. After the conquest of Canaan, Eglon, king of Moab, with the assistance of the Ammonites and Amalekites, gained possession of Jericho and ruled over Israel 18 years. From this bondage they were delivered under the leadership of Ehud, a Benjamite, who killed Eglon secretly, and aroused the people to a victorious conflict in which 10,000 Moabites were slain. Afterward peace and friendship between the nations were restored. While the judges ruled, Jews sometimes took refuge in the land of Moab; and long afterward, when David was hard pressed by Saul, he obtained from the king of Moab a temporary asylum for his father and mother. Saul waged war successfully against the Moabites, and David made them tributary. After the revolt of the 10 tribes, the kingdom of Israel levied this tribute, and when, on the death of Ahab, the Moabites refused to pay it, Jechoram, with the help of Judah and Edom, attempted to hold them in subjection. The Moabites, in revenge, formed a powerful confederacy against Judah, but the different armies which composed it, panic-stricken, turned their arms against each other. Still later, they acted against the Jews as auxiliaries of the Chaldeans, under Nebuchadnezzar: yet this monarch, after levying a considerable part of the Moabite army, and taking the city of Birs Nimrud, found it impossible to subdue them, and subdued them. After the return of the Jews from captivity, they formed an intimate connection with the Moabites by intermarriages, which, however, the zeal of Ezra and Nehemiah broke up. Josephus mentions the cities between the Arnon and Jabbok as cities of Moab. Thenceforth they were almost lost to view among the Arabians; and for many centuries little was known concerning the region in which they lived. Even in more modern times few travelers ventured to explore it. Seetzen, in 1806, at the risk of his life, shed a new and unexpected light upon it. He found many ruined places still bearing the old names. In 1812 Bعرkhhardt made the same tour from Damascos to Karak, and from that point advanced to Petra. From these and subsequent travelers we learn that the plains are covered with the sites of towns on every eminence or spot suitable for one. The land is capable of rich cultivation. The form of fields is still visible, and there are remains of Roman highways which are in some places completely preserved. The names of Trajan, Marcus Aurelius, and Severus, with the numbers legible upon them. Demarcations against Moab were made by Balbano, Amos, Isaiah, Jeremiah, Ezekiel, and other prophets, who during its highest prosperity foretold that its cities should become desolate without any to dwell in them; and at the present day, while the sites, ruins, and names of many of its ancient cities can be traced, not one of them has been found inhabited by man. At the present time the American engineers of the Palestine exploration society are engaged in making a scientific survey and exploration of the land.

MOABITE STONE, THE, a stone bearing a long inscription in Hebrew-Phoenician letters, discovered at Dibân, in Moab, in 1868. It appears to have been erected by Mesha, king of Moab, mentioned in 2 Kings, vii., and the inscription refers to his wars with Israel (in the 9th c. B.C.). The negotiations set on foot for its purchase led to quarrels among the Arab tribes claiming an interest in it, and the memorial was unfortunately broken to pieces. The fragments, however, were with great difficulty collected, and are now preserved in the Louvre.

MOABITE STONE, THE (contd.). The authenticity of this stone, disputed on grounds which have little to do with critical research, is now universally acknowledged. Its date may be taken as 800 B.C., and is almost the same as that of the inscriptions on the lions of Birs Nimrud, that is, the reigns of Ashurnazirpal and Shalmaneser IV. Its characters are like those of the fourth Malta inscription, and again like that from Nora, in Sardinia. We have, then, in the 9th c. B.C., one single and save upon very rare occasions for current purposes from Sardis to Asshur, which, about the 9th or 7th c., gives rise to the second form, or true Phoenician, and to the old Hebrew of coins and gems, whose modern representative is the Samaritan. The stil of Mesha contains all letters except Teth, and which, showing few dialectic variations, appears to stand, in willingness to express vowels, between the Hebrew and the Assyrian, without the parsimony so distinctive of the Phoenician. There is a translation by Dr. Ginsburg in Records of the Past, vol. xi.

MOAT, the ditch round the ramparts of a fortress, may be either wet—i.e., full of water—or dry. In the latter, which is the commoner case, the depth should not be less than 12 ft., nor the width under 24. The more perpendicular the walls, so much the greater will be the obstruction to the enemy. In regular works the walls are usually revetted with masonry, that at the foot of the rampart being the scarp or escarp, and that below the covered way the counterscarp. See Ditch and Fortification.

MOAWIYAH, Caliph, 610-58, b. Mecca; son of an Arab chief of distinguished birth, and distantly related to Mohammed. He was made governor of Syria in 641, and during his term of office conquered the island of Rhodes, but lost Cyprus. On the proclamation of Ali as the successor of the caliph Othman in 653, Moawiyah revolted, and attempted to make himself caliph. He succeeded in getting control of most of the provinces of the empire, and took possession of Samarcand and Bokhara. His army, after making extensive conquests, was unable, after a long siege and repeated assaults, to capture Constantinople, and in 678 he entered into a treaty of peace. Moawiyah not only exerted absolute control over the Sasanian empire, but succeeded in having the caliphate declared hereditary in his family.
MOBERLY, George, D.C.L., b. St. Petersburg, 1803; son of an English merchant. He was educated at Winchester and Oxford. In 1826 he took the Oxford chancellor's prize for the best English essay, choosing for his subject, Whether a Rule or a Refined Age is the more Favorable to the Production of Works of Fiction. He took the degree of M.A. in 1828 and of D.C.L. in 1836. After a connection with Balliol college, as tutor and fellow, he became, in 1835, head-master of Winchester school, where he remained until 1866. He was then presented with the living of Brixton in the Isle of Wight, and in 1868 became a canon of Chester cathedral. In 1869 he was consecrated bishop of Salisbury. Of his numerous published works the most important are: A Few Remarks on the Proposed Admission of Dissenters into the University of Oxford, 1834; Sermons Preached at Winchester College, 1841; and Sermons on the Beatitudes, 1860. He delivered the Bampton lectures for 1868, which appeared under the title of The Administration of the Holy Spirit in the Body of Christ; and he was one of the "five clergymen" who published revised versions of various books of the New Testament between 1857 and 1870.

MOBILE, Mobilize', an adjective and verb, used respectively in regard to continental armies, to designate a state of readiness for taking the field, and the act of making ready for such an operation. The process consists in augmenting a regiment from its peace to its war complement, in calling in men on furlough, in organizing the staff of divisions and brigades, constituting the commissariat, medical, artillery, and transport services, and in accumulating provisions and munitions. As the work of mobilizing an army causes great and inevitable expense, it is only resorted to when hostilities appear imminent.

MOBILE, a co. in s.w. Alabama, having the state line of Mississippi for its western border, the Mobile bay and the Mobile river flowing into it for its e. boundary, and the gulf of Mexico on the s.; drained by the Escatawpa river; 1500 sq m.; pop. ’80, 48,602—44,709 of American birth, 21,326 colored. It is intersected by the Mobile and Ohio railroad, the New Orleans, Mobile and Texas, and the Mobile and Alabama Grand Trunk. Its surface is generally level, a large proportion being covered with pine forests growing on sandy hills. Its climate is healthy, and the water is pure. Live stock is raised. All the products of the southern states are found here; the soil being a productive, sandy loam. Lumber and rice are the chief products. Dauphin island lies directly s. the site of a French settlement in 1702, called Massacre island from the quantities of bones found there, and was the occasional seat of the colony of Louisiana in early times. From its county seat steamboats run to Montgomery, Tuscaloosa, and New Orleans, carrying on an important commerce. Its bay will admit vessels of 21 ft. draught, and the harbor of Mobile vessels drawing 13 ft., and cotton is largely exported; also, cigars, staves, shingles, resin, and turpentine. Its industries include the manufacture of tin, copper, engines and boilers, tar, and turpentine. Seat of justice, Mobile.

MOBILE, the principal city and only seaport of Alabama, is situated on the w. side of Mobile river, and at the head of Mobile bay, which opens into the gulf of Mexico. It is built with broad shaded streets on a sandy plain, rising gradually from the river, with a fine custom-house and post-office, city hall and market-house, theater, odd fellows' hall, cathedral, 30 churches, 4 orphan asylums, several hospitals, a medical college, St. Joseph's college (a Jesuit institution), a convent of the visitation, and academy for young ladies. Mobile has several ship-yards, foundries, and cotton-presses. Its chief business is the export of cotton. The average export for five years preceding the civil war was 632,306 bales; in 1874-75, 151,343 bales, value $9,654,110, were exported; there is also a large exportation of turpentine, resin, and tar. Its harbor is defended by fort Morgan. Mobile was settled by the French in 1702. Pop. '70, 32,604.

MOBILE (auto). The city is 6 m, in length by 2 or 3 broad; pop. ’80, 31,295; a decline from 1870 of 759. It is chiefly inhabited along the line of the river and to a distance of about a mile inland; is lighted by gas, and has an excellent water supply from a distance of 5 m.; it has also sufficient horse-railroad facilities for its local need. Mobile is connected with the general railroad system of the country by the Mobile and Ohio, Mobile and Montgomery, New Orleans, Mobile and Texas, and Alabama Grand Trunk railroads. There are also steamers to Montgomery and other river towns. The following tables display the trade of Mobile from 1867-68 to 1874:

By these tables it is to be observed that from 1870 to 1874 there was a general decline in the foreign trade of Mobile, as there was a falling off in the population between 1870 and 1880, according to the tenth decennial census. The early history of this city displays more than the usual proportion of disturbing influences. Originally colonized by the French, it was long the most important point in the Louisiana settlement. It was attacked by famine and by epidemic; and in 1796 was the scene of that exceptional revolt known as the "petticoat insurrection," when the women of the place became dissatisfied with Indian corn as their staple article of food, and threatened rebellion. A disastrous hurricane, followed by a flood, nearly destroyed the settlement in 1791, and necessitated its removal from the place where it then stood, supposed to have been a point some 20 m. from its present location. By the treaty of Paris in 1763, Mobile was transferred to the British government; but twenty years later it was ceded to the Spanish government, with all the rest of the British possessions on the gulf, and remained in the possession of Spain until 1813, when it was surrendered to gen. Wilkinson. In 1819 it was incorporated as a city. From Jan. 11, 1861, to April 11, 1864, Mobile was in the hands of the Confederates. On Aug. 5, in the latter year, Admiral Farragut, with his fleet, passed up Mobile bay, and the memorable engagement with the forts and the confederate ships ensued, resulting in the destruction or capture of the latter, and the surrender of forts Gaines and Morgan. Early in the following spring the place was fully invested, and the remaining fortifications carried by assault.

**MOBILE BAY (inside),** an estuary of the gulf of Mexico, in the s.w. portion of the state of Alabama. The island of Dauphin lies on the w. of the entrance, and on the e. is Mobile point, the station of a light-house with a revolving light 55 ft. high. It has an outlet on the s.w. through Grant's pass, communicating with Mississippi sound, used by steamers of light draught, and the regular course of the Mobile and New Orleans steamers. The bar, 4 m. seaward, will admit vessels of from 18 to 20 ft. draught. The depth of the bay is from 12 to 14 ft. more shallow in the n. portion than in the s., the anchorage for the cotton fleet being near the entrance, where they are loaded by lighters from Mobile. It is fed by numerous affluent. The Mobile river, flowing into the n. portion, over mud flats, changing with each season, and increasing the sedimentary deposits of the bay. At Choctaw pass, where the Mobile river enters the bay, a channel through the bar is maintained by dredging, and similar means render the Dog river navigable. Its margins are thickly wooded with groves of live oak and magnolia, especially near the n. extremity, and pine forests crown the high bluffs which rise in other portions.

**MOBILE POINT,** at the e. extremity of the entrance to Mobile bay, is the end of a long, narrow strip of sand which stretches between Navy Cove and the bay of Bon Secours to the n., and the gulf of Mexico to the south. Fort Morgan is situated here, on the ground once occupied by fort Bowyer. The latter fort, which was rudely and unscientifically built, was attacked from the sea in Sept., 1814, by a British squadron of 2 brigs. and 2 sloops of war, and on the land by a force of 150 marines and 600 Indians. The American garrison, numbering but 130 men, under Col. Lawrence, and defended by 29 pieces of artillery, sustained for 3 hours the attack of the British, who were forced to withdraw with a loss of 232 killed and wounded; and their flag-ship was grounded and burned. The American loss was 8. Fort Bowyer was finally captured by the British, Feb., 1815.

**MOBILE RIVER and BAY of Alabama.** The river is formed by the confluence of the Alabama and Tombigbee. 50 m. above Mobile, which lies at its mouth. It is a sluggish stream, with low banks and several channels. The bay is 30 m. from n. to s., and 10 or 12 from e. to west. The entrance from the gulf of Mexico, 3 m. wide, is defended by fort Morgan and fort Gaines.

**MOBILE RIVER (outside),** formed in the s. extremity of Clarke co., Ala., is the boundary line between the counties of Mobile and Baldwin, and is navigable by large steamboats. Throughout its course it takes a s. direction, and, 6 m. below the junction of the rivers which form its head, it divides into two branches; the e. being called Tensas, the w. Mobile, the latter a name derived from the Mowcheans or Mobileans, a tribe of Indians.

**MOBILIER, Crédit.** On Nov. 18, 1852, the French government sanctioned the statutes of a new bank under the name of the Société Générale de Crédit Mobilier. The
name was intended as a contrast to the Sociétés de Crédit Foncier, which are of the nature of land banks, and advance money on the security of real or immovable property; while the Crédit Mobilier proposed to give similar aid to the owners of movable property. The declared object of this bank is especially to promote industrial enterprises of all kinds, such as the construction of railways, sinking of mines, etc. Various privileges were conferred upon it under its charter; in especial, it was allowed to acquire shares in public companies, and to pay the calls made upon it in respect of such shares by its own notes or obligations; also to sell or give in security all shares thus acquired. The operations of the society were conducted upon a very extensive scale. In 1874 it subscribed largely to the government loan on account of the Russian war, to the Grand Central railway company, to the General Omnibus company of Paris, and to various other important undertakings. The dividend for this year was 12 per cent. In 1855 it lent two sums to the government—the one of 250 and the other of 357 millions of francs. Its operations were vast during this year, and the dividends declared amounted to 40 per cent. The directors had not hitherto availed themselves of their privilege of issuing their own obligations, but this they now resolved on doing. They proposed to issue two kinds—the one at short dates; the other at long dates, and redeemable by Installments. The proposed issue was to amount to 340 millions of francs; but the public became alarmed at the prospect of so vast an issue of paper-money, so that in Mar., 1856, the French government deemed it necessary to prohibit the carrying out of the proposed scheme. This was a severe blow to the institution. In 1856 its dividends did not exceed 22 per cent; in 1857 they were only 5 per cent. Several attempts had been made to resuscitate its fortunes. It was offered a new charter in 1857, by which its assets at 77,000,000 francs. In 1876 the 500-franc shares were quoted at 290 francs. The Crédit Mobilier has undoubtedly been highly useful in developing the industrial power of France, but its operations have been hazardous, and had they not been checked in time, they would in all probability have ended in disaster.

MÖBIUS, August Ferdinand, 1790–1886, b. Germany; educated at Leipzig, where he was professor of astronomy from 1815. He reorganized the Leipzig observatory, and published a number of astronomical treatises, of which the best known are Elements of Celestial Mechanics, 1843, and Principles of Astronomy. His Manual of Statics treats of the relation between geometry and statics.

MOCCASIN SNAKE or Water Moccasin, also called cotton mouth, the ancistrodon piscivorus, a venomous serpent inhabiting the southern part of the United States. It has a length of about 2 ft.; color dark brown above and a gray belly. It lives in swamps and wet places and frequents the water. It is one of the most aggressive of all serpents, and its bite is of the most dangerous character.

MOCHA, the most strongly fortified seaport, and once the capital, of the province of Yemen, in Arabia. It is situated on the Red sea, at the head of a little bay near the strait of Bab-el-Mandeb, and 130 m. w.n.w. of Aden (q.v.). All round the shore is a hot sandy waste. The principal trade is in coffee, of which 10,000 tons (of the finest quality) are annually exported to England, France, and Bombay. Other exports are dates, gums, balm, ivory, senna, etc. Pop. 5,000.

MOCHA STONES are pieces of agate or of chalcedony, containing dendritic infiltrations, often assuming appearances very like finely ramified conforee, etc. They receive the name mocha stone because, when they first became known in Europe, they were brought from Mocha. Of the same nature with mocha stones are moss agates. The resemblance of the inclosed infiltrations to plants is often merely accidental, but it appears to be sometimes really due to plants, which were inclosed in the cavity in which the silicious mineral itself was formed.

MOCKING-BIRD, or Mocking-Thrush (Mimus or Orphana), a genus of birds of the family mowulidae, having a more elongated form than the true thrushes, a longer tail, shorter wings, and the upper mandible more curved at the tip. They are all American. The best known species, the mocking-bird of the United States (M. polyglottus), is about the size of the song-thrush; the upper parts of a dark brownish ash color, the wings and tail nearly black, the under parts brownish white. The mocking-bird is common in all parts of America, from the s. of New England to Brazil; n. of the Delaware, it is only a summer visitant, but in more southern regions it is found at all seasons. It is one of the most common birds of the West Indies, and its exquisite song fills their groves with melody by night, for which reason it is there very generally known as the nightingale. By day, the mocking-bird is generally inimitable, excelling all birds in its power of imitation, now taking up the song of one bird, and now of another, and often deceiving the most practiced ear by its perfect performance. By night, its song is for the most part natural. It does not confine itself, however, to musical strains; it seems to take equal pleasure in repeating the harshest cries of the feathered tribes; and in domestication readily adds to its accomplishments the imitation of almost any sound which it is accustomed to hear, passing from one to another with great rapidity, so as to produce an incomparable medley. The mocking-bird readily learns to whistle a tune, even of considerable length, but there is no well-authenticated instance of its imitating the human voice. The pinking of a dog, the mewing of a cat, the crowing of a cock, the cackling
of a hen, the creaking of a wheelbarrow, are all within the compass of its powers. During its performances, it spreads its wings, expands its tail, and throws itself about as if full of enthusiasm and enjoyment. The mocking-bird is vocal at all seasons of the year. It enjoys almost everywhere the protection of man, and often makes its nest in a tree or bush close beside a house. Two or three broods are produced in a year. The male is extremely attentive to his mate, and manifests extraordinary courage in driving away enemies from the nest. Mocking-birds often assemble on such occasions, and birds of prey, far superior to them in size and strength, are compelled to retreat. Snakes are killed by reiterated blows on the head, and cats learn to consider the vicinity of a mocking-bird's nest unsafe. The food of the mocking-bird consists chiefly of berries and insects. Another species of mocking-bird is found in the Rocky mountains, and species of the same genus are among the finest song-birds of the temperate parts of South America.

**MODE, in music.** Every musical passage is referable to and forms part of a succession of sounds having some appreciable relation to one another. This succession of sounds is called the scale, and is a series of steps leading from a given note called the key-note, or tonic (q.v.), to its octave. The steps or degrees of the scale are of unequal size, and on the place of the smaller ones or semitones depends the mode of the music. Taking our natural scale, there are only two notes in it which can satisfy the ear as key-notes—

![Major and Minor modes](image)

viz., C and A. In the major mode, with C as key-note, the semitone or small interval falls between the third and fourth sounds; in the minor mode, with A as key-note, it falls between the second and third sounds; in the former case, the third of the key-note is a major third, in the latter a minor third. The minor mode further requires to be modified by occasionally sharpening its sixth and seventh, in order to be pleasing to modern ears. The scale of the major mode is derived from simpler harmonic proportions than that of the minor. Melodies composed in the latter mode have generally more or less of a plaintive or melancholy character. For the theory of these modes, see Music. Ancient musicians admitted of a greater variety of modes. The Greeks had six, designated the Dorian, Phrygian, Lydian, Mixo-Lydian, Ionie, and ΑΕolian. The Ionic is the modern major, the ΑΕolian the minor mode; the others are more or less intolerable to a modern ear. They are used to a limited extent in the music of the Greek church, and in the Ambrosian chant.

**MODE (mode), in music,** a term applied to the two varieties, major and minor, of the diatonic scale, or series of tones employed in modern music. It is more rarely used for key, as "the twelve major and twelve minor modes or keys." In the old Greek music each note could become, as in the modern, the key-note of a new key or scale; but, as there was no introduction of new semitones, this change of key became a change of mode in the same sense as our major and minor. At first there were only four Greek modes—the Dorian, Phrygian, Lydian, and Mixo-Lydian—but later the Ionian and the ΑΕolian modes were added. St. Ambrose chose the first four for use in the church in the 4th c., and St. Gregory introduced the others 200 years later. They were termed ecclesiastical modes, and gave rise to the eight "Gregorian tones" or chants.

**MODELING** is the process of preparing from the original pattern or design from which a work in sculpture is to be cast or carved: the technical details will be found under Sculpture. Modeling is also practiced by medallists; the head or figure intended to be cut in the die being first modeled in relief with wax on a piece of slate. Goldsmiths, silversmiths, and jewelers also model intricate and artistic forms and ornaments of pieces of plate, to be cast and chased by them, or in which jewels are to be set. Wax is the substance used when delicacy and minuteness are required. Modeling is also a branch of the potter's trade. Flaxman modeled for Wedgwood numerous figures and groups in wax. For large models, the material employed is potter's clay, which, when used by sculptors, is mixed with a portion of sandstone, finely pulverized, to make it work freely.

**MODENA,** formerly a duchy of Italy, in the n., between the Po and the Mediterranean. It was bounded on the n. by Lombardy and the papal states, on the e. by Tuscany and the papal states, on the s. by Tuscany, Sardinia, and the Mediterranean, and on the w. by Sardinia and Parma. Area, 2,371 sq. m.; pop. in 1860, about 600,000. The only rivers of importance are the Margra and the Serchio, which empty into the Mediterranean. The n.e. part of the duchy is fertile, like the Lombard plain, to which it belongs. The vine is extensively cultivated, and the other chief productions are wheat, maize, hemp, and flax. For the history of the duchy, see Modena, the capital. The modern province of Modena comprises the provinces Modena and Forlì of the old-duchy. Area, 966 sq. m.; pop. 72,273,331.

**MODENA** (anc. Matina), capital of the former duchy of same name, a fortified city of Northern Italy, 24 m. w. n.w. of Bologna. Pop., 71, 89,54. It stands between the rivers Secchia and Panaro, in a pleasant plain, noted for its rich soil and salubrious air,

---

The text presented is a mixture of natural language and musical notation. The musical notation includes symbols for major and minor modes, representing different scales in music theory.
and from its surrounding ramparts commands fine views of the Apennines. Although the social life of Modena is somewhat stagnant, it is, nevertheless, a most agreeable city. It lies on the famous Via Emilia (see EMILIAN PROVINCES), by which it is divided into the old and new city, and is connected by a navigable canal with the rivers Secchia and Panaro. Among the public buildings may be noted the cathedral of St. Geminianus, the patron of the city: a structure of the purely Lombard style. The campanile is one of the greatest in Italy; it is a square tower 574 ft. high, and 315 ft. in height, its entire façade being in white marble. The ducal palace, a picturesque structure of the 17th c., is adorned with an infinity of galleries, courts, and marble arches; it contains the splendid Biblioteca Estense, numbering 100,000 volumes, and 3,000 rare MSS.; also the valuable Este archives, a most important collection of medial records, collections of coins and medals of great antiquity, and an observatory. Schools of theology, law, medicine, and mathematics have replaced the university suppressed in 1821; there are also fine museums of natural history, a botanical garden, theaters, and good public baths. The trade of Modena is unimportant: the manufactured products are confined to linen and woolen fabrics, leather, hats, paper, glass, and pottery, besides silk manufactured to a much less extent than formerly. Modena is the birthplace of the great anatomist Fallopio, and the antiquary Sigonio.

The ancient history of Modena affords evidence that it enjoyed at an early period a considerable degree of prosperity; the splendor, wealth, and arts of the city of Modena being mentioned by Cicero, Pliny, and Strabo. In modern times Modena has shared more or less the various vicissitudes which befell Italy, and participated in the great internecine feuds of the country. In 960 a member of the great house of Este was proclaimed marquis of Modena, and in 1452 the then reigning marquis was created duke by the emperor Frederick III. In 1796 Modena formed part of the Cisalpine Republic, but was restored in 1814 by the congress of Vienna to the reigning family. The duchy had at that time an area of 2,310 sq. m., and a pop. of 586,000. In 1848 the dukedom of Modena was temporarily deprived of his rights; and in 1860 the population definitively expelled their unpopular ruler, who carried off all the property and valuables within his reach, including the silver handles of the palace doors. Modena is now a province of the kingdom of Italy; area 960 sq.m.; pop. '71, 273,331.

MODERATOR, a term used in Scotch ecclesiastical law to describe the chairman or president of a Presbyterian church court.

MODICA, the Molae of the Saracens, a city of the island of Sicily, in the province of Val di Noto, 59 m. from Syracuse. Pop. 72, 55,169. The city, which stands perched amid ruins, contains several fine buildings and, notwithstanding the humidity of the climate, the sanitary condition of the inhabitants seems satisfactory. The soil of the surrounding district is the most productive of Sicily, and yields vast quantities of corn, tobacco, oil, wine, hemp, which, with cheese, wool, soda, and butter, form the chief export trade of the place. The valley of Ipsica, or Ipsica, in the vicinity of Modica, contains remarkable rocks, in which numerous dwellings are excavated.

MODILLION, an ornamental bracket much used in classic architecture, especially in the cornices of the Corinthian and Composite styles.

MODOCs, the name of a tribe of American Indians, meaning "enemies," and applied to them by a hostile tribe. The Modocs formerly belonged to the Klamaths (q.v.), but became estranged from them and eventually antagonistic. They are supposed to have originated on the shores of lake Klamath in California. They were dull and lethargic by nature, unimpressible, with little expression to their features, and little energy or activity in their movements and habits. They had the custom of making slaves of their prisoners of war, and of buying and selling these, after the fashion of the ancient Romans and Carthaginians. They had a religion, in which a mythical deity whom they called Komoose, stood in the place of a god. In 1847 and 1849 they are said to have conducted predatory excursions against the whites. A year later Capt. Nathaniel Lyon fought a band of these Indians on Clear lake, Modoc Co., Cal., and defeated them, inflicting severe and merited chastisement. But by 1852 the Modocs appear to have forgotten this infliction, or remembered it with an unwise disposition for vengeance, for they again indulged in a massacre of white settlers, and invited fresh retribution. This was effected in a manner not according to the laws of civilized warfare, however, for the Modocs were invited by the whites to attend a pow-wow and feast, presumably of a peaceful character, and, of the 46 who accepted the invitation, 41 were ruthlessly murdered. After this act of warfare continued for many years. In 1856 a campaign against them was carried out by Gen. Custer, and a large number were slaughtered. This did not put an end to the war, however, which continued until 1864, when they acceded to the stipulations of a treaty, ratified and proclaimed early in 1870. By this treaty they agreed to give up their lands to the U. S. government, and to go upon a reservation to be set apart for the Modocs, and left in the hands of the whites, and two different reservations, but these were already occupied by their enemies, the Klamaths, a fact which kept them continually in trouble. Two chiefs had now begun to obtain considerable notoriety, not alone on the frontier, but among the settled states. These were capt. Jack, who was the leader of a band of Modocs that was making itself particularly obnoxious to the whites; and Schonchin, hereditary chief of the tribe, whose followers were less objectionable. In 1868 capt.
Jack, with his party, moved to Lost river, where they remained until 1872, when orders were given by the superintendent of Indian affairs to return them to the reservation. Troops from fort Klamath were sent against their camps, and after some fighting they were dislodged, and retreated to a district known as the "lava beds," near fort Klamath, Oregon, where they were enabled to strongly intrench themselves, owing to the peculiar natural formation of the country. On Jan. 17, 1873, the troops under gen. Wheaton entered the lava beds and attempted to drive out the Modocs, but with such ill success that they were even unable to approach nearer to them than a distance of 2 or 3 miles. The troops lost 11 killed and 21 wounded, and were forced to retire. A second attempt was made under the command of gen. Gillem, but this also resulted in failure. Commissioners were now appointed by the government to confer with capt. Jack, and endeavor to bring about a peaceful settlement of the existing troubles. A meeting was arranged for April 11, 1873, which took place according to appointment, but was treacherously concluded by the Modocs, who fired upon the commissioners, with the result of killing outright gen. Canby and Dr. Thomas, and wounding Mr. Meacham, also a commissioner. This act broke up the conference, and a fierce fight ensued, the Modocs resisting desperately until starved out and forced to surrender, an event which did not occur until nearly two months later. The troops during this part of the siege were commanded by gen. Jeff. C. Davis, to whom belongs the honor of having at length forced the stubborn savages to acknowledge their defeat. A military commission was now appointed to try the chief offenders, and capt. Jack, Schonchin, jr., and two other Modocs were condemned to die. They were accordingly executed at fort Klamath, Oct. 3, 1873. The remainder of the band were retired to a reservation in the Indian territory.

**Modulation.**

In music. When in the course of a melody the key-note is changed, and the original scale altered by the introduction of a new sharp or flat, such change is called modulation. Much of the pleasure of music is derived from a judicious use of modulation. The art of good modulation from one key to another consists in the proper choice of intermediate chords. Sudden transitions, without intermediate chords, should be employed but sparingly, and in peculiar circumstances. Every piece of music is composed in a particular key, in which it begins and ends, which generally predominates over any other keys that may be introduced in the course of the composition.

**Modifier.** In classic architecture, an arbitrary measure for determining the proportions of the various members of the orders. The diameter, semi-diameter, or one-third of the diameter are most frequently used; the first being usually divided into 60 parts (or minutes), the second into 30 parts, and the third into 20 parts.

**Modulus.** A constant coefficient or multiplier, by means of which one series or system of quantities can be reduced to another similar series or system. Thus we have the modulus of elasticity (q.v.), of friction (q.v.), and of systems of logarithms (q.v.). The system of logarithms which is universally accepted as the primary is Napier's, and from it all other systems are deduced in the following manner: Let N be a number of which the Napierian logarithm is b, e being the Napierian base, it is required to find the logarithm of N to some other base a. Let x be this logarithm, then (see Logarithms) \( N = \log_a x \), and, taking the Napierian logarithms of both sides of this equation, \( \log_e N = \log_e \log_a x \), or (since \( \log_e 1 = 0 \)) \( b = x \log_e \log_a \), therefore \( x = \frac{b}{\log_e \log_a} \), i.e., \( \log_a N = \frac{1}{\log_e \log_a} \times \log_e N \).

This multiplier, or "modulus," \( \frac{1}{\log_e \log_a} \), is independent of N, and is therefore constant for the reduction of all Napierian logarithms to the system whose base is a. If \( a = 10 \), the multiplier becomes \( \frac{1}{\log_e 10} \), the modulus of Briggs's, or the common system of logarithms, and is equal to 0.4342944...

**Modus, in English law, means a peculiar custom by which lands become exempted from payment of tithes on paying some composition or equivalent.**

**Møen, a Danish island in the Baltic sea, separated from Seeland on the n.w. by the Ulfsund, and from Falster on the s.w. by the Grénsund. It is 19 m. long, by about 5 m. in average breadth. Area, 84 sq. miles. Pop. about 15,000, who are supported by agriculture, fisheries, and commerce. It has been called the Switzerland of Denmark, and is remarkable for the irregularity of its surface. The soil is fruitful. Its chief town and seaport; Stege, has a pop. 70, 1900.**

**Møre, a lake, the ancient name of a sheet of water in Egypt, now known as Birket-el-Kerun, or El-Kerun ("the lake of the promontory"), is situated in the province of Fayum, about 50 m. s.w. of Cairo; extreme length from n.e. to s.w., 30 m.; breadth, 6 m.; it was formerly much larger. Its average depth is 12, and its greatest ascertained depth 28 feet. On the n. and w., its shores are rocky, but on the s., flat and sandy. It is connected with the Nile by a canal called Bahr-Josaf ("the river of Joseph"). The waters are brackish, on account of their being impregnated with the alkaline salts of the desert, and with the muriate-of-slime depositions of the surrounding hills. In the time of the Pharaohs, the revenue derived from the fisheries was applied to the maintenance...**
of the queen's wardrobe and perfumes. Under the Persians, they were let (during the season of the inundations, when the canal fed the lake) at $150 a day. At present, however, they only yield about £84 a year.

Mesia, an ancient Roman province, bounded by the Danube on the n., the Black sea on the e., the mountain-chains of Humus (Balkan) and Orbatus on the s., that of Scardus and the rivers Drinus (Drina) and Savus (Save) on the w.e. The river Cibarus (Cibriz) divided it into two parts, of which the eastern (Mesia inferior) is the present Bulgaria, and the western (Mesia superior) is Servia. Its original inhabitants were mostly of Thracian race. Gaulish or Celtic invaders settled in western Mesia about 277 n.c., under the name of Scordisci. The Romans first came in contact with the tribes of Mesia after the conquest of Macedonia, when C. Scipionius Curio forced his way as far n. as the Danube, and gained a victory over the Messians (75 n.c.), but the country was completely subjugated till 29 n.c. It was made a Roman province in the reign of Augustus, and flourished for more than two centuries, but as a frontier province it was much exposed to hostile invasions, and required a line of fortresses and stations all along the s. bank of the Danube. In 250 A.D. the Goths made an irruption into the country, and defeated and slew the Roman emperor, Decius. In the following year, and about the end of the 4th c., it was given up to them by the emperor Theodosius I. Slavonian tribes settled in Mesia in the 6th and 7th centuries.

Meso-Gothic Gospels. See Ulfilas (ante).

Meso-Goths, the name given to the Goths who in the 3d c. settled in lower Mesia at the mouth of the Danube. Ulfilas (q.v.) was a Meso-Goth. The name, however, became of more general use to designate those who remained in Mesia after the great migration in the beginning of the 6th century.

Moffat, a market t. and favorite watering-place of Scotland, in the co. of Dumfries, stands in the upper part of the broad and beautiful valley of the Aman, and is surrounded by hills of moderate elevation. It is 2 m. from the Beattock station, on the Caledonian railway, and 19 m. n.n.e. of Dumfries. Among other public edifices are the baths and the reading and assembly rooms. The mineral springs, the principal of which, like that of Harrogate, is saline and sulphurous, are highly celebrated; but perhaps the greatest attractions of the place are its salubrious air and exquisite environs. During the season the town is increased in population by from 800 to 1000 visitors, to suit whose convenience great numbers of elegant villas, commanding fine views of the neighboring country, have been erected. Pop. 71, 1730.—The Moffat hills extend between the counties of Lanark and Peebles in the n., and Dumfries in the s.; highest summit Hartfell, 2,650 feet. See Black's Guide to Moffat.

Moffat, Robert, a distinguished missionary, b. at Ormiston, East Lothian, Dec. 21, 1795. Having resolved to become a missionary to the heathen, he offered his services to the London missionary society, was accepted, and sent by them to South Africa. Arriving at Cape Town in 1817, he immediately proceeded beyond the boundaries of Cape Colony to Namaqualand, where he entered upon his labors at the kraal of Africander, a chief whose name had long been a terror to the people of the neighboring districts of the colony, on account of the audacious raids which he made among their settlements, and his ferocious character, but who had lately become a convert to Christianity, and now showed a warm desire for its promotion. Here Moffat labored for three or four years with great success, Christianity and civilization advancing together. But the situation, on account of the drought and sterility of the country, and its very thinly scattered population, being unsuitable for a principal mission-station, he set out in search of a better locality, and labored at several stations in succession in the countries to the n. and n.e. of Cape Colony. Wherever he went, the gospel was gladly received by some of those who heard it, and in some places by many. In every place he also guided the people in the arts of civilized life. He made several missionary tours, and his adventures were very remarkable, and are graphically described in his work, Missionary Labors and Scenes in Southern Africa (Lond. 1842), which he wrote and published during a visit of several years to Britain, rendered necessary by the state of his health. In 1842 Moffat returned to his labors in that country, and came back to England in 1870. His daughter was the wife of the celebrated Dr. Livingstone. In 1873 he was presented with the sum of £5,500 in recognition of his great services. He lectured on African missions in the nave of Westminster abbey in 1875.

Mogadore, or Suehara, a fortified t., and the principal seaport of Morocco, 130 m. w.s.w. of the city of that name, on the Atlantic ocean. Pop. about 20,000. It is the port of the capital, and was founded in 1760, on the site of an old Portuguese fort. It stands on a rocky promontory, opposite an island of the same name, long a haunt of pirates, which forms the harbor, and is said to be the best built town of the kingdom. Its streets are regular, though narrow, and it consists of two parts, each surrounded by walls. The quarter called the Fortress contains the custom-house and the treasury, and is the residence of the pasha, the vice-consuls, and the Christian merchants. The town is defended by four batteries on the island, and by a fort on the land-side; the walls are also defensible. Mogadore is the seat of considerable trade; it exports olive-oil, wool, gum, hides, feathers, gold-dust, and almonds. In 1875, 114 ves.sels, of 28,907 tons.
entered, and 211, of 27,918 tons, cleared the port. The value of the cargo of these
vessels was £367,718; of those clearing, £259,930. The imports are woollens, cottons, hardware,
etc.

MOGILA, or MOGILAS, Peter, 1597–1646; b. Moldavia; educated at the university of
Paris. After serving in the Polish army he went into a monastery at Kiev, and
became metropolitan of that town in 1625. He brought to Kiev from Paris the improved
methods of study and the more advanced theological studies which were as yet unknown
to Russia. He set up a printing press, and founded an academy and a library, to which
he gave his own collection of books. With a view to strengthen the Greek church, he
published A Confession of Faith, which contains an exposition of its doctrines, and
which remains a standard treatise on the theology of his church. He also wrote a Catechism,
a partial hagiography, and a number of dramas in verse.

MOGUER (Arab. "caves," of which there are many in the neighborhood), a t.
of Spain, in the province of Huelva, 43 m. w.s.w. of Seville, rises gently above the Rio
Tinto, near the mouth of which is its port, Palos. The streets are generally broad and
straight, but both the town and castle are much dilapidated. The old Franciscan con-
vent was ordered in 1846 to be preserved as a national memorial, but it is now fast going
to ruin, and the wood of the cells stripped off. It was here, in 1484, that Columbus,
leaving charity, was received by the prior, Juan Perez de Marchena, by whose influence
he was enabled to prosecute his discoveries, setting out from the port of Palos on Aug. 3, 1492.
It was to this port also that he returned, Mar. 15, 1493, after having accom-
plished the first voyage ever accomplished by wise discoverers land. In May 1528,
after the capture of Mexico and lodged in the same convent which gave shelter to Columbus.
Palos is now a poor decayed fishing port. Moguer has some trade in wine and
fruit. Pop. 6,600.

MOGUI, great, the popular designation of the emperor of Delhi, as the impersona-
tion of the powerful empire established in Hindustan by the Mongols (q.v.), who were
called Moguls by the Persians. The first great Mogul was Baber, the great-grandson of
Timur, who founded the Mongol empire in Hindustan in 1526. In 1803 the great
Mogul was deprived of his throne; in 1827, of even the appearance of authority,
becoming a mere pensioner of the British; and in 1858, Mohammed Bahadur, the last of
the dynasty, was condemned, and transported for complicity in the Indian mutiny.

MOHACS, a market t. of Hungary, 110 m. s.s.w. of Pesti, on the western arm of
the Danube. It contains a gymnasium, has an important cattle-market, is a station for
steamboats on the Danube, and the seat of considerable trade in wine, coal, timber,
and agricultural produce. Pop. 69, 12,149. It owes its historical importance to the great
battle fought here, Aug. 29, 1526, between Louis II., of Hungary, with 25,000 Hun-
garians, and the sultan Soliman at the head of about 200,000 Turks. The battle
resulted in the disastrous defeat of the Hungarians, who lost their king, 7 bishops, many
nobles and dignitaries, and upwards of 22,000 men. A second battle was fought here
on Aug. 12, 1687, when the Turks in their turn were defeated by an Austro-Hungarian
army under Charles of Lorraine.

MOHAIR, the wool of the Angora goat (see Goat and Angora), a native of Asia
Minor. Few animals have so beautiful a covering as the fine, soft, silky, long,
and always pure white wool of this goat. Each animal, at the annual clip in April or May,
yields from 2 lbs. to 4 lbs. of wool. It is only within the last 30 years that this wool has been in
great request in Britain, but its development as an article of trade has been
simultaneous with that of alpaca. In 1876 the amount of mohair and other goats' hair
imported was 5,848,199 lbs.; the value, £711,717. See Woolen Manufactures.

MOHAMMED (Arab. the Prophet*), the name taken, at a later period, by the founder
of Islam. He was originally called Halabi. He was born about the year 570 A.D., at
Mecca, and was the son of Abdallah, of the family of the Hashim; and of Amina, of the
family of Zuhra, both of the powerful tribe of the Kureish, but of a side-branch only,
and of little or no influence. His father, a poor merchant, died either before
or shortly after Mohammed's birth, whom his mother then (according to a doubtful tra-
tition) is supposed to have handed over, after the fashion of her tribe, to a Bedouin
woman, that she might nurse him in the salubrious air of the desert. In consequence
of the repeated fits of the child, however, which were ascribed to demons, the nurse sent
him back in his third year. When six years old he also lost his mother. His grand-
father, Abd-Al-Muttadid, adopted the boy; and when, two years later, he, too, died,
Mohammed's uncle, Abu Taib, though poor himself, took him into his house, and
remained his best friend and protector throughout his whole life. The accounts which
have survived of the time of his youth are of too legendary a nature to deserve credit;
certain, however, it seems to be that he at first gained a scanty livelihood by tending
the flocks of the Meccans, and that he once or twice accompanied his uncle on his jour-
nies to southern Arabia and Syria. In his 25th year he entered the service of a rich
widow named Chadidja, likewise descended from the Kureish, and accompanied her car-

* Or, according to Deutsch, whose view is fully corroborated and adopted by Sprenger in his Leben und Lehre Mohammed's, in allusion to Hag. ii. 7, the predicted Messiah.
avans—in an inferior capacity, perhaps as a camel-driver—to the fairs. Up to that time his circumstances were very poor. Suddenly his fortune changed. The wealthy, but much older, and twice widowed Chaddja offered him her hand, which he accepted. She bore him a son, Al-Kāšim—whence Mohammed adopted the name Abu Al-Kāšim—and four daughters: Zainab, Fāţima, Umun Khulthum, and Fāţima; and afterwards a second son, whom he called Abū Manif, after an idol worshipped among his tribe. Both his sons, however, died early. Mohammed continued his life in Mecca, but with much energy, spending most of his time in solitary contemplations. In his 35th year he is said to have, by chance only, been chosen arbiter in a quarrel about the replacing of the sacred black stone in the Ka'bah (q.v.); but not before his 40th year is there anything really important to be told of his life.

Before, however, entering on the weighty events of the subsequent period, it is by no means unimportant to advert to such traits of Mohammed's outward appearance as are yet recoverable. He was of middle height, rather lean, but broad shouldered, and altogether of strong build; slightly-curled black hair flowed round his strongly developed head; his eyes, overhung with thick eyelashes, were large and cool-black; his nose, large and slightly bent, was well formed. A long beard added to the dignity of his appearance. A black mole between his shoulders became afterwards among the faithful "the seal of prophecy." In his walk he moved his whole body violently, "as if descending a mountain." His gait and presence were altogether of an extremely imposing nature. In his 40th year Mohammed received his first "revelation," or, in other words, became first aware that he had a "mission." About the year 600 A.D. Christianity had penetrated into the heart of Arabia, through Syria on the one, and Abyssinia on the other hand. Judaism no less played a prominent part in the peninsula, chiefly in its northern parts, which were dotted over with Jewish colonies, founded by emigrants after the destruction of Jerusalem; and round about Yathrib (Medina). Besides these two all-important religious elements, several sects, remnants of the numerous ancient sects which had sprung up everywhere during the first Christian centuries; Sabians, Mandaeans, etc., on the frontiers of Syria and Babylonia, heightened the religious ferment which, shortly before the time of Mohammed, had begun to move the minds of the thoughtful. At that time there arose, according to unauthentic historical accounts, several men in the Hedjaz (Waraka, Obeid Allah, Othman, Zayd, etc.), who preached the futility of the ancient pagan creed, with its star-worship, its pilgrimages and festive ceremonies, its temples and fetiches. It had in reality long ceased to be a living faith, and only the great mass of the people clung to it as to a sacred inheritance from times immemorial. The unity of God, the "ancient religion of Abraham," was the doctrine promulgated by these forerunners of Mohammed, and many of those who, roused by their words, began to search for a form of religion which should embody both the traditions of their forefathers and a purer doctrine of the divinity, turned either to Judaism or to Christianity. The principal scene of these missionary labors was Mecca, then the center of the pilgrimages of most of the Arabian tribes, and where, from times immemorial, long anterior to the city itself, the Ka'bah (q.v.), Mount Arafat, the valley of Mina, etc., were set apart for the purpose of these snail-shell-like ceremonies of the faithful, which had taken place every year since the 5th century. It was under these circumstances that Mecca felt "moved" to teach a new faith, which should dispense with idolatry on the one, as with Judaism and Christianity on the other hand. He was 40 years of age, as we said, when he received the first "divine" communication in the solitude of the mountain Hira, near Mecca. Gabriel appeared to him, and in the name of God commanded him to "read"—that is, to preach the true religion, and to spread it abroad by committing it to writing (Sur. xxvi.). How far Mohammed was a "prophet," in the common sense of the word, has been the subject of endless and utterly futile discussions in the Christian world. That he was no vulgar impostor is now as generally recognized as that other once popular doctrine, that he was in league with the devil, is rejected by thinking men. What part his epilepsy had in his "visions," we are not able to determine. Certain it is that, after long and painful solitary broodings, a something—not clearly known to himself—at times moved him with such fearfully tumultuous vehemence as to drive him, during his revelations, is said to have roared like a camel, and to have screamed with perspiration; his eyes turned red, and the foam stood before his mouth. The voices he heard were sometimes those of a bell, sometimes of a man, sometimes they came in his dreams, or they were laid in his heart. Waraka, one of his wife's relatives, who had embraced Judaism, spoke to him of the Jewish doctrine, and told him the story of the patriarchs and Israel; not so much as it is told in the Bible, but in the Midrash; and the gorgeous hues of the legendary poetry of the latter seem to have made as deep an impression on Mohammed's poetical mind as the doctrine of the unity of God and the moral,--in its broad outlines—of the Old Testament, together with those civil and religious laws, scriptural and oral, which are either contained as germs or fully developed in this record. Christianity, especially the Lenin, influenced and his spiritual spring. All his knowledge of the New Testament was confined to a few apocryphal books, which he read with some reverence before Jesus, whom, together with Moses, he calls the greatest prophet, next to himself, his notions of the Christian religion and its founder were excessively vague. For some details on these points, however, we must refer to Koran and Mohammedan-ism.
His first revelation he communicated to no one, it would appear, except to Chaddilja, to his daughter-in-law, his step-son Ali, his favorite slave Zaid—whom he had probably freed and adopted by this time—and to his friend, the prudent and honest Abu Bekr. His other relatives rejected his teachings with scorn. Abu Lahab, his uncle, called him a fool; and Abu Talib, his adoptive father, although he never ceased, for the honor of his family, to protect him, yet never professed any belief in Mohammed's words. In the fourth year of his mission, however, he had made 40 proselytes, chiefly slaves and people from the lower ranks; and now first some verses were revealed to him, commanding him to come forward publicly as a preacher, and to defy the scorn of the unbelievers.

With all his power he now inveighed against the primeval superstition of the Meccans, and exhorted them to a pious and moral life, and to the belief in an all-mighty, all-wise, everlasting, indivisible, all-just and merciful God, who had chosen him as he had chosen the prophets of the Bible before him, so to teach mankind that they should escape the punishments of hell, and inherit everlasting life. God's mercy—this was a primitive doctrine, common to the whole east—was principally to be obtained by prayer, fasting, and almsgiving. The belief in the sacredness of the Kaaba and the ceremonies of the pilgrimage were too firmly rooted in his and the people's minds not to be received into the new creed; but certain barbarous habits of the Bedouins, such as the killing of their new-born daughters, were ruthlessly condemned by Mohammed. The prohibition of certain kinds of food also belonged to this first period, when he as yet entirely stood under the influence of Judaism; the prohibition of gambling, usury, etc., probably being of a somewhat later date. Whether he did or did not understand the art of writing and reading at this time, is not known, but he professed not to know it, and employed the services of amanuenses for his Koranic dicta, which at first consisted merely of brief, rhymed sentences, in the manner of the ancient Arabic soothsayers. [KORAN.] The Meccans did not object to his doings; they considered him a common "poet" or "soothsayer," who, moreover, was not in his right senses, or simply a liar. Gradually, however, as the number of his converts increased, they began to pay more and more attention to his proceedings; and finally, fearing mostly for the sacredness of Mecca, which the new doctrine might abolish, thus depriving them of their chief glory and the ample revenues of the pilgrimages, they rose in fierce opposition against the new prophet and his adherents, who dared "to call their ancient gods idols, and their ancestors fools." Many of the converted slaves and freedmen had to undergo terrible punishments; and others suffered so much at the hands of their own relatives that they were forced to revoke their creed; so that the prophet himself advised his followers to emigrate to Abyssinia. Mohammed himself, although protected by the strong arm of Abu Talib, was yet at that time so little-spirited and fearful, that he even raised the idols, which hitherto he had represented as nought, to intermediate beings between God and man—a dictum, however, which he soon revoked as an inspiration of Satan, thereby increasing the hatred of his adversaries, at whose head stood two members of the family of Machzum, Al-Walid and Abulhakam Amr (called by Mohammed "Father of Foolishness"), and who in every way tried to throw ridicule on him. At last it became necessary that he should be put beyond the reach of his persecutors, and Abu Talib hid him in a fortified castle of his own in the country. Hamza, his uncle, and Omar, formerly a bitter enemy of Mohammed, and who afterwards, with Mohammed and Abu Bekr, became the third head of Islam, continued in the meantime to spread the new doctrine. The Koreish now demanded that Mohammed should be delivered into their hands, but Abu Talib steadfastly refused to comply with their wishes; a feud therefore broke out between their family and that of the Hashemites, and Mohammed and all the members of his family, except, perhaps, Abu Lahab, were excommunicated. After the space of three years, however, the "peace party" in Mecca brought about a reconciliation, and Mohammed was allowed to return. A great grief befell him at this time—his faithful wife Chaddilja died, and, shortly afterwards, his uncle Abu Talib, and, to add to his misery, the vicissitudes of his career had reduced him by this time to poverty. An emigration to Taif, where he sought to improve his position, proved a failure; it was with great difficulty that he escaped with his bare life. During this epoch he had the well-known dream of his journey to Jerusalem and in the heavens on the back of the Borak (Miraq), the relation of which caused even his stanchest adherents to smile at his hallucination. Shortly after his return from Taif he married Sauda, and afterwards so increased the number of his wives that at his death he still left nine, of whom Ayishah, the daughter of Abu Bekr, and Hafsa, the daughter of Omar, are best known. In the midst of his vain endeavors to find a hearing in his own city, and those near it, he succeeded, during a pilgrimage, in converting several men from Medina, whose inhabitants had long been accustomed to hear from the mouths of the numerous Jews living in the city and its neighborhood the words Revelation, Prophecy, God's Word, Messiah: to the Meccans mere sounds without any meaning. The seed sown into the minds of these bore a fruitful harvest. The next pilgrimage brought 12, and the third more than 70 adherents to the new faith from Medina, and with these he entered into a close alliance. Mohammed now conceived the plan to seek refuge in the friendly city of Medina, and about 622 (10, 13, or 15 years—according to the different traditions—after his first assuming the sacred office) he fled thither, about 100 families of his faithful flock having preceded him some time before, accompanied by Abu Bekr, and reached, not
without danger, the town, called thence Mediat Annabi (city of the prophet), or Medina "City," by way of eminence; and from this flight, or rather from the first month of the next Arabic year, dates the Mohammedan era (Hegiraj. Now everything was cherished to the advantage of the prophet and his religion; and if formerly the incidents of his life are shrouded in comparative obscurity, they are, from this date, known often to their most insignificant details. Formerly a despised "madman or impostor," he now assumed at once the position of highest judge, lawgiver, and ruler of the city and two most powerful Arabic tribes. His first care was directed towards the consolidation of the new worship, and the inner arrangements in the congregation of his flock; his next chief endeavor was to proselytize the numerous Jews who inhabited the city, to whom, besides having received their principal dogmas into his religion, he made many important concessions also in the outer observances of Islam, and concluded alliances with many of their tribes; but he was sorely disappointed in his hopes to convert them. They ridiculed him and deplored his weak spirit to such a degree that he soon abrogated his concessions, and became their bitter adversary up to the hour of his death. The most important act in the first year of the Hegira was his permission to go to war with the enemies of Islam in the name of God—a kind of manifesto chiefly directed against the Meccans. Not being at first to fight his enemies in open field, he endeavored to weaken their power by attacking the caravans of the Koreish on their way to Syria. Being successful enough to disturb their trade, and, at the same time, to conclude alliances with the adjoining Bedouin tribes, he at last dared to break even the peace of the sacred month of Rajjab, and with this the signal to open warfare was given. A battle, the first, between 314 Moslems and about 600 Meccans was fought at Badr, in the second year of the Hegira; the former gained the victory, and made many prisoners. A great number of adventurers now flocked to Mohammed’s colors, and he successfully continued his expeditions against the Koreish and the Jewish tribes, chiefly the Beni Krumkâ, whose fortified castles he took after a long siege. Notwithstanding a severe loss which he suffered in the battle near Ohod, in which he himself was dangerously wounded, his power increased so rapidly that in the sixth year of the Hegira already he was able to proclaim a public pilgrimage to Mecca. Although the Meccans did not allow this to be carried out, he gained the still greater advantage that they concluded a formal peace with him, and thus recognized him as an equal power and belligerent. He was now allowed to send his missionaries all over Arabia, and even beyond the frontiers, without any hindrance; and in the following year he had the satisfaction of celebrating the pilgrimage for three days undisturbed at Mecca. Shortly afterwards, during his expeditions against the Jews of Chaibar and Fadak, Mohammed very nearly lost his life: a Jewess, Zinab by name, a relative of whom had fallen in the fight against him, placed a poisoned piece of roast meat before him, and although he merely tasted it, he yet, up to his death, suffered from the effects of the poison. His missionaries at this time began to carry his doctrines abroad, to Chosroes II., to Heræius, to the king of Abyssinia, the viceroy of Egypt, and the chiefs of several Arabic provinces. Some received the new gospel, but Chosra Parvis, the king of Persia, and Amru the Ghas-sunide, rejected his proposals with scorn, and the latter had the messenger executed. This was the cause of the first war between the Christians and the Moslems, in which the latter were beaten with great loss by Amru. The Meccans now thought the long-desired moment of revenge at hand, and broke the peace by committing several acts of violence against the Chuzaites, the allies of Mohammed. The latter, however, marched at the head of 10,000 men against Mecca, before its inhabitants had had time to prepare for the siege, took it, and was publicly recognized by them as chief and prophet. With this the victory of the new religion was secured in Arabia. While, however, employed in destroying all traces of idolatry in the besieged city, and fixing the minor laws and ceremonies of the true faith, Mohammed heard of new armies which several warlike Arabic tribes marched against him, and which were concentrated near Taif (630). Again he was victorious, and his dominion and creed extended further and further every day. From all parts flocked the deputations to do homage to him in the name of the various tribes, as well as the messenger of God, or at least as the prince of Arabia, and the year 8 of the Hegira was therefore called the year of the deputations. Once more he made most extensive preparations for a war against the Byzantines; but not being able to bring together a sufficient army, he had to be satisfied with the homage of a few minor princes on his way to the frontiers, and to return without having carried out his intention. Towards the end of the 10th year of the Hegira he undertook, at the head of at least 40,000 Moslems, his last solemn pilgrimage to Mecca, and there (on the mount Arafât) instructed them in all the important laws and ordinances, chiefly of the pilgrimage; and the ceremonies observed by him on that occasion were fixed for all times. (Hijri.) He again solemnly exhorted his believers to righteousness and piety, and chiefly recommended them to protect the weak, the poor, and the women, and to abstain from usury.

Returned from Mecca, he occupied himself again with the carrying out of his expedition against Syria, but fell dangerously ill very soon after his return. One night, while suffering from an attack of fever, he went to the cemetery of Medina, and prayed and wept upon the tombs, praising the dead, and wishing that he himself might soon be delivered from the storms of this world. For a few more days he went about; at last, too weak further to visit his wives, he chose the house of Ayeshah, situated near a
Mohammed. Mohammedanism.

mosque, as his abode during his sickness. He continued to take part in the public prayers as long as he could; until at last, feeling that his hour had come, he once more proceeded to the people, recommending Abu Bekr and Usma, the son of Zaid, as the generals whom he had chosen for the army. He then asked, like Moses, whether he had wronged any one, and read to them passages from the Koran, preparing the minds of his hearers for his death, and exhorting them to peace among themselves, and to strict obedience to the tenets of the faith. A few days afterwards, he asked for writing materials, probably in order to fix a successor to his office as chief of the faithful; but Omar, fearing he might choose Ali, while he himself inclined to Abu Bekr, would not allow him to be furnished with them. In his last wanderings he only spoke of angels and heaven. He died in the lap of Ayeshah, about noon of Monday the 12th (11th) of the third month, in the year 11 of the Hegira (8th of June, 632). His death caused an immense excitement and distress among the faithful, and Omar, who himself would not believe in it, tried to persuade the people of his still being alive. Abu Bekr said to the assembled multitude: "Whoever among you has served Mohammed, let him know that Mohammed is dead; but he who has served the God of Mohammed, let him continue in his service, for he is still alive, and never dies." While his corpse was yet unburied, the quarrels about his successor, whom he had not definitely been able to appoint, commenced; and finally Abu Bekr received the homage of the principal Moslems at Medina. Mohammed was then buried in the night from the 9th to the 10th of June, after long discussions, in the house of Ayeshah, where he had died, and which afterwards became part of the adjoining mosque.

This, in briefest outline, is Mohammed's career. We have not been able to dwell, as we could have wished to do, with any length, either on the peculiar circumstances of his inner life, which preceded and accompanied his "prophetic" course, nor on the part which idolatry, Judaism, Christianity, and his own reflection respectively, bore in the formation of his religion; nor have we been able to trace the process by which his "mission" grew upon him, as it were, and he, from a simple admirer of his family, became the founder of a faith to which now above 150,000,000 are said to adhere. The articles Koran and Mohammedanism contain some further details on his doctrine and its history. We have, in addition to the few observations on the points indicated at the beginning, only to reiterate that a man of Mohammed's extraordinary powers and gifts is not to be judged by a modern commonplace standard; and that the manners and morals of his own time and country must also be taken into consideration. We are far from overrating his character. He was at times deceitful, cunning, even revengeful and cowardly; and generally addicted beyond limit to sensuality. But all this does not justify the savage and silly abuse which has been heaped upon his name for centuries by ignorance and bigotedism. Not only his public station as prophet, preacher, and prince, but also his private character, his amiability, his faithfulness toward friends, his tenderness toward his family, and the frequent readiness to forgive an enemy, besides the extreme simplicity of his domestic life (he lived, when already in full power, in a miserable hut, mended his own clothes, and freed all his slaves), must be taken into consideration; and to do him full justice, his melancholic temperament, his nervousness, often bordering on frenzy, and which brought him to the brink of suicide, and his being a poet of the highest order, with all the weaknesses of a poet developed to excess, must not be forgotten. Altogether, his mind contained the strangest mixture of right and wrong, of truth and error. Although his self-chosen mission was the abolition of superstition, he yet believed in Jins, omens, charms, and dreams, and this is an additional reason against the, as we said, now generally abandoned notion that he was a vulgar designer, who by no means deceived himself about those revelations which he pretended to have received. And however much the religion of Islam may, rightly or wrongly, be considered the base and prime cause of the rottenness of eastern states and nations in our day, it must, in the first place, not be forgotten that it is not necessarily Islam which has caused the corruption, as indeed its cities are for the most part of the highest order; and in the second place, that Mohammed is not to be made responsible for all the errors of his successors. Take him all in all, the history of humanity has seen few more earnest, noble, and sincere "prophets"—using the word prophet in the broad human sense of one irresistibly impelled by an inner power to admonish, and to teach, and to utter austere and sublime truths, the full purport of which is often unknown to himself.

The most important European biographies of Mohammed are those of Spenger, Weil, Muir, Noldeke, Reimund. See also Koran, Mohammedanism, Sunna.

MOHAMMED, the name of four sultans of Turkey, of whom the most noted is Mohammed II., surnamed Bajaz or THE GREAT, the conqueror of Constantinople. He was born at Adrianople in 1430, and succeeded his father Amurath II., in 1450. His first acts were the murder of his two brothers, and the suppression of a rebellion in Karaman. Having thus secured himself on the throne, he bent all his energies to the accomplishment of the great project which had always been kept prominently in view by his predecessors—the capture of Constantinople. This city was now the sole remnant of the once mighty empire of the Caesars; and after more than a year spent in preparations, Mohammed commenced the siege April 6, 1453, with an army of 258,000 men, and a fleet of 320 vessels. The Greeks, aided by a gallant band of 3,000 strangers, under Gian
Justinian, a noble Genoese, long maintained an obstinate resistance. On the morning of May 29, a combined attack was made by land and sea without success; but the retirement from the ramparts of Justinian, who had been severely wounded, and despaired of a successful defense, caused a panic among his followers, and the simultaneous charge of a chosen body of janizaries, with Mohammed himse{r, cut their head, was irresistible. Constantine III died in the breach, and the Turks poured in over his corpse to plunder and devastate his capital. Mohammed now transferred the seat of his government to Constantinople, and sought to win back the inhabitants by promising them the free exercise of their religion. He next reduced the kingdoms of Morea and Trebizond, offsets of the Greek empire, obtained possession of Servia on the death of its last prince, and made formidable preparations for the invasion of Hungary. Belgrade was the first point of attack; and with 100,000 men, supported by a fleet of 200 ships on the Danube, Mohammed sat down before its walls. The enormous ordinance which had done such good service at Constantinople, were employed to batter the ramparts; but the valor, skill, and activity of the defenders foiled its utmost efforts. John Hunyady (a.v.), who, with 5,000 chosen troops, had re-enforced the garrison, destroyed or captured all his vessels, and soon after, by a sudden sally, defeated his army, and carried off the battered train, compelling him to raise the siege, Aug. 6, 1456. His next enterprise was the invasion of Epirus, where Scanderbeg had hitherto successfully defied the sultan's power. Three Turkish armies were destroyed in rapid succession, and a fourth and fifth under Mohammed himself met with no greater success; but the death of the gallant Epirote, in 1467, removed the only obstacle to the success of the sultan's plans, and Epirus was forthwith annexed to Turkey. The latter half of Mohammed's reign was also fruitful in important achievements, but our space will permit only a cursory notice of them. He reduced the khan of the Crimea to the condition of a vassal, deprived the Genoese of Caffa, and the Venetians of Friuli, Istria, Negropont, and Lemnos; but the knights of St. John repelled him from Rhodes, and the Venetians from Scodra. He carried his arms into Italy, and took Otranto, but died in 1481 at Nicomedes, while on the way to join his son Bajazet, who was warring with the Christians and Egyptians. His frequent contests with the Saracens of these nations had always interfered very much with the successful prosecution of his designs of conquest in Europe. Mohammed was possessed of great abilities; he was brave, enterprising, and sagacious; nor was he deficient in learning, for he spoke four languages fluently, was well versed in geography, ancient history, and the natural sciences, and was practically acquainted with the fine arts. But the brilliancy of his career, and the occasional generosity and even magnanimity which he showed, cannot obliterate the recollection of those acts of cruelty and treachery which have justly branded him as the most ruthless tyrant of the house of Osman. As the founder of the Turkish power in Europe, his memory has always been revered by the Turks.

MOHAMMED IV., 1462-92; b. Turkey: succeeded his father, Ibrahim I., in 1468. He possessed little capacity for power, and spent most of his time in the chase. He was fortunate in having as successive grand viziers two men of extraordinary talents—the Albanian Mohammed Kuprili or Kuperi, and his son, Ahmed Kuprili. Mohammed Kuprili promptly quelled the disturbances which prevailed throughout the empire at Ibrahim's death, and carried on the war with Venice which had been begun by Ibrahim. The Turkish fleet was defeated by the Venetians in the archipelago in 1461, and, five years later, another Turkish fleet was completely destroyed by them. In 1467 the Turks retook Lemnos and Negropont. In 1469 war was declared with Austria; the Turkish army, after a successful campaign in Hungary, was at length badly defeated in 1464 by the combined forces of France, Italy, and Germany. In 1461 Ahmed Kuprili succeeded his father as vizier, and continued the war with Venice. He laid siege to the city of Candia in 1467, and forced it to surrender in 1469. A treaty of peace was negotiated between the two states at once. In 1472 Mohammed IV. put himself at the head of the army and invaded Poland, but was badly defeated the next year by John Sobieski, and in 1476 Poland was granted a treaty of peace. In 1462 Turkey declared war against Austria upon the occasion of a revolt in Hungary, and in 1463 Kara Mustapha, with an army of 300,000 men, laid siege to Vienna. The imperial army had fled from the city, which was on the point of capitulating, when it was received by an army under Charles of Lorraine and John Sobieski, who defeated the Turks, whose position grew every day more precarious. Another alliance was formed against them between Venice, Germany, Russia, and Poland. In 1487 Charles of Lorraine defeated the Turkish army, which suffered heavy losses, at Mohacs, and soon after Transylvania and other Danubian provinces fell away from Turkey. Late in 1487 a mutiny broke out in the Turkish army before Belgrade; the troops marched upon Constantinople, deposed Mohammed IV. of his throne, and made his brother sultan as Solymon III. Mohammed IV. was imprisoned during the rest of his life.

MOHAMMEDANISM, the religion founded by Mohammed, or, according to him, the only orthodox creed existing from the beginning of the world, and preached by all the prophets ever since Adam. It is also called Isdun, resignation, entire submission to the will and precepts of God. In its exclusively dogmatical or theoretical part, it is Imân, faith; in its practical, Dm, religion (by way of eminence). The fundamental principles
Mohammedanism.

80

of the former are contained in the two articles of belief: "There is no God but God, and Mohammed is God's apostle." The Mohammedan doctrine of God's nature and attributes coincides with the Christian, in so far as he is by both taught to be the Creator of all things in heaven and earth, who rules, and preserves all things, without beginning, omnipotent, omniscient, omnipresent, and full of mercy. Yet, according to the Mohammedan belief, he has no offspring: "He begoteth not, nor is he begotten." Nor is Jesus called anything but a prophet and apostle, although his birth is said to have been due to a miraculous divine operation; and as the Koran superseded the Gospel, so Mohammed, Christ. The crucifixion is said to have been executed upon another person, Christ, having been taken up unto God before the decree was carried out. He will come again upon the earth, to establish everywhere the Moslem religion, and to be a sign of the coming of the day of judgment. Next to the belief in God, that in angels forms a prominent dogma. Created by fire, and endowed with a kind of incorporeal body, they stand between God and man, adoring or waiting upon the former, or interceding for and guarding the latter. The four chief angels are: The Holy Spirit, or "Angel of Revelation"—Gabriel; the special protector and guardian of the Jews—Michael, the "Angel of Death"—Azrael (Raphael, in the apocryphal gospel of Barnabas); and Israfil—Uriel, whose office it will be to sound the trumpet at the resurrection. It will hardly be necessary, after what we said under Mohammed, to point out, in every individual instance, how most of his "religious" notions were taken almost bodily from the Jewish legends; his angelology, however, the Jews had borrowed themselves from the Persians, only altering the names, and, in a few cases, the office of the chief angelic dignitaries. Besides angels, there are good and evil genii, the chief of the latter being Ibils (despair), once called Azazil, who, refusing to pay homage to Adam, was rejected by God. These Jinn are of a grosser fabric than angels, and subject to death. They, too, have different names and offices (Peri, fairies; Div, giants; Takvins, fates, etc.), and are, in almost every respect, like the Shedim in the Talmud and Midrash. A further point of belief is that the earth is divided into seven regions, corresponding very nearly to the seven regions of Paradise. Four only of the original 104 sacred books: viz., the Pentateuch, the Psalms, the Gospel, and the Koran, are said to have survived; the three former, however, in a mutilated and falsified condition. Besides these, a certain apocryphal gospel, attributed to St. Barnabas, and the writings of Daniel, together with those of a few other prophets, are taken notice of by the Moslems, but not as canonical books. The number of prophets, sent at various times, is stated variously at between 200,000 and 300,000, among whom 313 were apostles, and six were specially commissioned to proclaim new laws and dispensations, which abrogated the preceding ones. These were Adam, Noah, Abraham, Moses, Jesus, and Mohammed—the last the greatest of them all, and the propagator of the final dispensation. The belief in the resurrection and the final judgment is the next article of faith. The dead are received in their graves by an angel announcing the coming of the two examiners, Monker and Nakir, who put questions to the corpse respecting his belief in God and Mohammed, and who, in accordance with the answers, either torture or comfort him. This again is the Jewish "Chibbut hakkeber," the beating of the grave, a hyperbolical description of the sufferings during the intermediate state after death (purgatory). The soul, awaiting the general resurrection, enters according to its rank, either immediately into paradise (prophets), or partakes, in the shape of a green bird, of the delights of the abode of bliss (martyrs), or—in the case of common believers—is supposed either to stay near the grave, or to be with Adam in the lowest heaven, or to remain either in the well of Zen-Zem, or in the trumpet of the resurrection. According to others, it rests in the shape of a white bird under the throne of God. The souls of the infidels dwell in a certain well in the province of Hadramaut (Heb. Chambers of Death), or, being first offered to heaven, then offered to earth, and rejected by either, subject to unspeakable tortures until the day of resurrection. Concerning the latter, great discrepancy reigns among the Mohammedans themselves. Mohammedanism seems to have held that both soul and body will be raised, and the "Bone Luz" of the Jewish Haggadah was by him transformed into the bone Al Ajb, the rump-bone, which will remain uncorrupted till the last day, and from which the whole body will spring anew, after a forty days' rain. Among the signs by which the approach of the last day may be known—nearly all taken from the legendary part of the Talmud and Midrash, where the signs of the coming of the Messiah are enumerated—are the decay of faith among men, the advancing of the meanest persons to highest dignities, wars, seditions, and tumults, and consequent dire distress, so that a man, passing another's grave, shall say: "Would to God I were in his place?" Certain provinces shall revolt, and the buildings of Medina shall reach to Yahâb. Again: the sun will rise in the west, the Beast will appear, Constantinople will be taken by the descendants of Isaac, the Antichrist will come and be killed by Jesus at Lund. There will further take place, a war with the Jews, Gog and Magog's (Dajug and Majuj's) eruption, a great smoke, an eclipse, the Mohammedans will return to idolatry, a great treasure will be found in the Euphrates, the Kaaba will be destroyed by the Ethiopians, beasts and inanimate things will speak, and finally, a wind will sweep away the souls of those who have faith, even if equal only to a grain of mustard seed, so that the world shall be left in ignorance. The time of the resurrection even Mohammed could not learn from Gabriel: it is a mystery. Three blasts will announce it: that of conser-
nation, of such terrible powers that mothers shall neglect the babies on their breasts, and that heaven and earth will melt; that of examination, which will annihilate all things and beings, even the angel of death, save paradise and hell, and their inhabitants; and forty years later, that of resurrection, when all men. Mohammed first, shall have their souls breathed into their restored bodies, and will sleep in their sepulchers until the final doom has been passed upon them. The day of judgment, lasting from one to fifty thousand years, will call up angels, genii, men, and animals. The trial over, the righteous will enter paradise, to the right hand, and the wicked will pass to the left, into hell; both, however, have first to go over the bridge Al Sitâh, laid over the midst of hell, and finer than a hair, and sharper than the edge of a sword, and beset with thorns on either side. The righteous will proceed on their path with ease and swiftness, but the wicked will fall down headlong to hell below—a place divided into seven stories or apartments, respectively assigned to Mohammedans, Jews, Christians, Sabians, Magians, idolaters, and—the lowest of all—to the hypocrites, who, outwardly professing a religion, in reality had none. The degrees of pain—chiefly consisting in intense heat and cold—vary; but the Mohammedans, and all those who professed the unity of God, will finally be admitted to paradise, which is divided into nine parts—Paradise is divided from hell by a partition (Orf), in which a certain number of half-saints will find place. The blessed, destined for the abodes of eternal delight (Janmat Aden, Heb. Gan Eden)—of which it is, however, not quite certain whether it is created already—will first drink of the pond of the prophet, which is supplied from the rivers of paradise, whiter than milk, and more odoriferous than musk. Arrived at one of the eight gates, they will be met by beautiful youths and angels; and their degree of righteousness (prophets, religious teachers, martyrs, believers) will procure for them the corresponding degree of happiness. It may, however, not be superfluous to add that, according to the Mohammedan doctrine, it is not a person's good works or merits which gain his admittance, but solely God's mercy; also, that the poor will enter paradise five hundred years before the rich; and that the majority of the inhabitants of hell are women. As to the various felicities which await the pious (and of which there are about a hundred degrees), they are a wild conglomeration of Jewish, Christian, Magian, and other fancies on the subject, to which the prophet's own exceedingly sensual imagination has added very considerably. Feasting in the most gorgeous and delicious variety, the most costly and brilliant garments, odors, and music of the most ravishing nature, and above all, the enjoyment of the Hûr Al Òyûn, the black-eyed daughters of paradise, created of pure musk, and free from all the bodily weaknesses of the female sex, are held out as a reward to the commonest inhabitants of paradise, who will always remain in the full vigor of their youth and manhood.* For those deserving a higher degree of recompense, rewards will be prepared, of a purely spiritual kind—i.e., the "beholding of God's face" (Shechinah) by night and by day. A separate abode of happiness will also be reserved for women, but there is considerable doubt as to the manner of their enjoyment. That they are not of a prominently spiritual nature is clear from the preceding. It is explained and the matter is carried one stage further. The latter section曙t the inter- cepted with God that she might be admitted into paradise, whereupon he replied that old women were not allowed in paradise, which dictated—causing her to weep—he further explained by saying that they would first be made young again. The last of the precepts of pure faith taught by Mohammedanism, is the full and unconditional submission to God's decree (Islam), and the predestination of good and evil, which is found, from the beginning, inscribed on a "preserved table." Not only a man's fortunes, but his deeds, and, consequently, his future reward or punishment, are irrevocably, and thus unavoidably, pre-ordained (fate): a doctrine which is not, however, taken literally by all Moslems, but which has no doubt contributed largely to the success of Islam, by inspiring its champions with the greatest indifference and contempt for the dangers of warfare; their destiny being immutably fixed, under any circumstances. Thus far, briefly, the Iman, dogmatical or theoretical part of Islam. The Din, or practical part, which contains the ritual and moral laws, inculcates as the chief duties the following four: prayer, alms-giving, fasting, and pilgrimage. Prayer, "the key of paradise," comprises also certain religious purifications, as the most necessary preparations to the former. They are of two kinds: the Ghusl, or total immersion of the body, required as a religious ceremony, on some special occasions; and the Wudâ', a partial ablution, to be performed immediately before the prayer. This is of primary importance, and consists of the washing of hands, face, ears, and feet up to the ankles—a proceeding generally accompanied at each stage by corresponding pious

* "The whole earth will be as one loaf of bread, which God will reach to them like a cake; for meat they will have the ox Balam and the fish Nîm, the lobes of whose rivers will suffice seventy thousand men. Every believer will have eighty thousand servants, and seventy-two girls of paradise, besides his own former wives, if he should wish for these, and a large tent of pears, jacinths, and emeralds: three hundred dishes of gold shall be set before each guest at once, and the last morsel will be as grateful as the first. Wine will be permitted, and will flow copiously, without inebriating The faithful will have at their disposal both the only drink and the noblest beverage, and besides the most resplendent pearls and jewels. If they desire children, they shall beget them, and see them grow up within an hour. Besides the ravishing songs of the angel Israfil and the daughters of paradise, described, while the voices of their beings, the clashing of bells suspended from them, and the clashing of their fruits, which are pears and emeralds, make sweetest music."

U. K. X.—6
Mohammedanism.

sentences, and concluded by the recital of the 97th chapter of the Koran. In the case of water being beyond reach, dry dust or sand may supply its place. "The practice of religion being founded on cleanliness," it is not sufficient that the believer himself should be purified, but even the ground or the carpet upon which he prays must be as clean as possible, and the use of a special prayer-carpet (Seggadch) is therefore recommended. Every Mohammedan is obliged to pray five times in the space of every twenty-four hours. The prayer (Salah) itself consists partly of extracts from the revealed book, the Koran (Fard), partly of pieces ordained by the prophet without allegation of a divine order (Sunnah). The first time of prayer commences at the Maghrib, or about sunset; the second, at the Asr, or nighttime; the third, at the Subh, or daybreak; the fourth, at the Dhuhr, or about noon; the fifth, at the Asr, or afternoon. The believers are not to commence their prayers exactly at sunrise, or noon, or sunset, lest they might be confounded with the infidel sun worshippers. These several times of prayer are announced by the Ministers (q.v.) from the minarets or mugals of the mosque. The chant, sung to a very simple but solemn melody, sounds harmoniously and sonorously down to the height of the mosque, through the midday din and roar of the cities, but its impression is one of the most strikingly poetical in the stillness of night; so much so, that even many Europeans cannot help congratulating the prophet on his preferring the human voice to either the Jewish trumpet-call of the time of the Temple, or the Christian churchbells. The day-call (the Adan) consists chiefly of the confession of faith (God is most great—Mohammed is God's apostle—come to prayer, come to security) repeated several times; the night-calls (Ul. the first; Ebed, the second), destined for persons who desire to perform supererogatory acts of devotion, are much longer. The believer often changes his posture during his prayers; and a certain number of such inclinations of head and knees, prostrations, etc., is called a Saka. It is also necessary that the face of the believer be turned towards Mecca, in the direction of Mecca (q.v.), the exterior wall of the mosque marking the direction. The Minstrels (Mehrab). All sumptuous and pompous apparel is laid aside before the believer approaches the sacred place; and the extreme solemnity and decorum, the unaffected humility, the real and all absorbing devotion which pervades it, have been unanimously held up as an example to other creeds. Women, although not strictly forbidden to enter the mosque, yet are not practically allowed to pray there, lest their presence might be hurtful to true devotion. Besides these prayers, there are others ordained for special occasions, as on a pilgrimage, before a battle, at funerals, during an eclipse, etc. That the Moslems do not pray to Mohammed, but simply invoke his intercession, as they do that of the numerous saints, the relatives of the prophet, and the first propagators of Islam, need, after what we said under MOHAMMED, not be dwelt upon here. For the particulars of the service in the mosque, the reader is referred to that heading. It may be remarked in passing, that Mohammedanism has no clergy in our sense of the word, the civil and religious law being bound up in one. See also MOLLAH, MUFTI.

Next in importance stands the duty of giving alms. These are twofold—legal (Zakah) and voluntary (Sadaqah; Heb. Zadakah, piety, righteousness); but the former, once collected by the sovereign, and applied to pious uses, has now been practically abrogated. The Sadaqah is, according to the law, to be given once every year, of cattle, money, corn, fruits, and wares sold, at about the rate of from two and a half up to twenty per cent. Besides these, it is usual to bestow a measure of provisions upon the poor, at the end of the sacred month of Ramadan.

The duty of fasting follows. [FASTEs.] During the whole month of Ramadan, the Moslem is commanded to refrain from eating, drinking, smoking, smelling perfumes, bathing, and every unnecessary indulgence in worldly pleasure, from daybreak until sunset. From that period till the morning, he is allowed to eat, drink, and enjoy himself. The Arabian years being lunar, it often happens that the Ramadan falls in midsummer, when the fasting, more especially the abstaining from drinking, is excessively mortifying. None are exempt from this duty save the sick, travelers, and soldiers in time of war; but they are bound to fast an equal number of days during some other months. Nurses and pregnant women are entirely free from fasting. It is Mohammed's special and express desire that no one should fast who is not quite equal to it, lest he might injure his health, and disqualify himself for necessary labor. Of the other commandable fast-days, the Ashura, on the 10th of Moharram (the Jewish Yom Kippur), deserves special mention. There are very few Moslems who do not keep the Ramadan, even if they neglect their other religious duties; at all events, they all pretend to keep it most strictly, fasting being considered "one-fourth part of the faith," nay, "the gate of religion."

Of the fourth paramount duty of the Mohammedan—viz., the pilgrimage to Mecca—we have spoken both under that heading, and more fully, in the article IMAAM. Suffice it here briefly to recapitulate that the Ka'ba (q.v.) is to be encompassed seven times, the celebrated black stone being kissed at each round, that Mount Arafa is to be visited, the sacrifice of the Ransomed (the Ransom, in memory of Ismael's sacrifice) to be performed, and a number of minor ceremonies to be gone through by the pilgrim, and that he who neglects to perform the sacred pilgrimage, "might as well die a Jew or a Christian."

To the "positive" observances of Islam may also be reckoned the "Saghir," or minor, and "Kebr," or great festivals. [FESTIVALS.] The firs' Al-Fitr, or breaking the
fast), following immediately upon the Ramadán, begins on the first day of the month of Shawál, and lasts three days. The second (Id al-Kurban, or sacrifice) begins on the 10th of Dhu-l-Hegge, when the pilgrims perform their sacrifice, and lasts three or four days. Yet, although intended to be the more important of the two, the people have in most places changed the order, and, by way of compensation for the previous fast, they make the lesser festival which follows the Ramadán the more joyful and the longer of the two. The day set aside for the weekly day of rest is the Friday—not, as is generally supposed, because both the Jewish Sabbath and the Christian Sunday were to be avoided, but because, from times long before Mohammed, the people used to hold public assemblies for civil as well as religious purposes on that day. The celebration of the Moslem days of religious solemnity is far less strict than is the custom with the other Shemitic religions. Service being over, the people are allowed to return to their worldly affairs, if they cannot afford to give themselves up entirely to pleasure or devotion for the rest of the day.

Thus far, briefly, the principal positive laws of Islam relating to faith and practice. We shall now touch upon the fundamental prohibitory laws contained in the Koran.

First of all, the drinking of wine, which includes all strong and intoxicating liquors, as giving rise to "more evil than good," is rigorously forbidden; and although of late, chiefly through European influence, very many Moslems have lost their religious scruples on that score, and not only secretly but openly indulge in spirits, yet the great bulk of the faithful refuse even to make use of the proceeds of the sale of wine or grapes. Some over-scrupulous believers even include opium, coffee, and tobacco in the prohibition; but general practice has decided differently. The prohibitory laws respecting food resemble closely those of Judaism: blood, the flesh of swine, further, animals which have died from disease or age, or on which the name of some idol has been invoked, or which have been sacrificed unto an idol, or which have been strangled, or killed by a blow, a fall, or by some other beast, are strictly forbidden. "Pure" animals must be slaughtered according to certain fixed rules, and the name of God is to be invoked before the operation, without, however, the usual addition of the benevolent epithets, since these would ill befit the sufferings of a fellow-creature. Fish, birds, game are mostly allowed for food, yet there are in nearly all cases certain religious ceremonies to be observed, before they become fit for the believer's table.

All games subject to chance ("casting lots by arrows")—such as dice, cards, tables, bets, etc.—are considered so wicked, that a gambler's testimony is invalid in a court of law. (The Talmud only rejects the testimony of the habitual "dice-[Kubia, i.e., Cube] gambler and better upon does.") Chess and other games depending on skill—provided they do not interfere with the regular performance of religious duties, and that they are played without any stakes whatsover—are allowed by the majority of Moslem theologians. Usury is strictly prohibited. Taking interest upon any loan, however large or small, or profiting in trade through any questionable means, save by buying and selling, is severely condemned.

To prevent the faithful from ever falling back into idolatry, the laws relating to images and pictures have been made very stringent. Whosoever makes an imitation of any living being in stone, wood, or any other material, shall, on the day of judgment, be asked to endow his creation with life and soul, and, on his protesting his inability of doing so, shall undergo the punishment of hell for a certain period.

The civil and criminal laws of Mohammedanism, founded both on the Koran and the Traditions (Sunna), are, in some instances, where the letter of the written or oral precept allows of various explanations, or where the case in question is not foreseen, interpreted according to the opinion of one of the four great masters of Islam: Abu Hanifa, Ma'mon, Ans, Shafi'ot, Ibn Hanbal, within the pale of their respective sects. The principal points, however, upon which all Mohammedans agree are the following: Polygamy is allowed, not, as is commonly supposed, without any restriction, but: "Take in marriage of the women who please you, two, three, or four; but if ye fear that ye cannot act equitably, one; or those whom your right hands have acquired"—i.e., your slaves. These are the explicit words of the Koran (iv. 3), so that four wives, and a certain number of concubine slaves, is the whole extent to which a Moslem may legally go. The prophet's example proves nothing to the contrary, since he was endowed with special privileges, and not subject to the common law in many respects. It is, moreover, added, as an advice, that to marry one or two is quite sufficient for a man, if he apprehend any inconvenience from a larger number of wives. A Moslem may, if urged by excessive love, or if unable to obtain a wife of his own creed, marry a Christian woman or a Jewess, but a Mohammedan woman is not, under any circumstances, to marry an unbeliever. In all cases, however, the child born of a Moslem, whatever the mother's faith, is a Moslem; nor does the wife, who is an unbeliever, inherit at her husband's death. Forbidden degrees are: the mother, daughter, sister, half-sister, aunt, niece, foster-mother, or a woman related to the faithful "by milk in any of the degrees which would preclude his marriage with her, if she were similarly related to him by consanguinity;" the mother of his wife, even if he be not properly married to the latter yet; the daughter of his wife, if the latter still be his legal wife; his father's wife and his son's wife; or two sisters at the same time; or wives who stand to each other in the relation of aunt and niece; or the unmanipulated slave, or another man's slave, if he have already a free wife. A simple declaration of a man and
woman at the age of puberty, before two witnesses, of their intention to marry each other, and the payment of part of the dowry (which is indispensable, and must amount to at least ten dirhems, or about five shillings), is sufficient for a legal marriage. A girl under age is given away by her natural or appointed guardian, with or without her consent. To see the face of any woman who is neither his wife nor his concubine, nor belongs to any of the forbidden degrees, is strictly forbidden to the believer.

Divorce is a comparatively light matter with the Mohammedans. Twice, a man may send away his wife and take her back again without any ceremony; the third time, however—if he unite the triple divorce in one sentence at once—he dare not receive her again in wedlock until she has been married properly to another man in the meantime. Mere dislike is sufficient reason for a man to dissolve the conjugal ties, and his saying: "Thou art divorced," or "I divorce thee," together with the payment of part of the wife's dowry, is all that is required from him by the law. A wife, on the other hand, is bound to her husband forever, unless she can prove some flagrant ill-usage or neglect of conjugal duty on his part; and even then, she forfeits part, or the whole, of her dowry. A divorced woman is obliged to wait, like a widow, for a certain period before marrying again: if pregnant, until delivery; three months, or four months and ten days, according to circumstances. If she have a young child, she is to suckle it until it be two years old, and the father is to bear all the expenses of the maintenance of mother and child. A woman proving disobedient to her husband, may be declared by the kadi "nashizheh," i.e. rebellious, and the husband is no longer bound to maintain her. Yet, he cannot be forced to divorce her under these circumstances, so that the woman is generally in so sore a plight that she is obliged to premise good behavior for the future, and the husband has then either to take her back to his house, or to set her free by a formal divorce. On the other hand, it often happens that a woman prefers a mere separation, to continuing to live with her husband; in which case, she gets herself, of her own accord, inscribed a "nashizheh." If a slave becomes a mother by her master, and he acknowledges the child to be his own, the latter is free, and the mother is to be emancipated at the master's death, and may not be given away, or otherwise disposed of by him, during his lifetime. A free person, wishing to marry his or her slave, must first emancipate this slave; and if the slave of another person has been married by a free man or woman, and afterward becomes the latter's property, the marriage becomes illegal, and can only be renewed by a legal contract and emancipation.

The privilege of primogeniture does not exist in the Mohammedan law, but males generally receive a double share. A person may not bequeath more than one-third of his property, unless there be no legal heirs. Children, whether begotten with the legal wife, or slave, or concubine, or only adopted, and their descendants, are the first heirs; next come the claims of wives, parents, brothers, sisters, in their order. Where there is no legal heir, the property falls to the crown.

The law is very lenient toward debtors, the Koran recommending the creditor to remit a debt "as alms." Insolvency and inability to work for the discharge of the claim, solve all further obligations. The most conscientious performance of all private contracts, however, is constantly recommended in the Koran.

Murder is either punished with death, or by the payment of a fine to the family of the deceased, according to their own pleasure. There must, however, be palliating circumstances in the latter case. The Bedouins, however, have expanded the law of blood-revenge in a terrible manner, and up to this day the "vendetta" often rages not only between family and family, but between whole tribes, villages, and provinces. Unintentional homicide is expropriated by freeing a believer from slavery, and paying to the family a certain sum in proportion to the rank and sex of the deceased. He who has not the means of freeing a believer, is to fast for two months by way of penance. According to the strict letter of the law, a man is not liable to capital punishment for killing his own child or an infidel; but, practically, no difference is generally made by the Mohammedan governments (chiefly the Turkish) in our day. Murder is punished with death, and no fine frees the culprit.

The Mosaic law of retaliation, in case of intentional wounds and mutilation, holds good also for Islam; that is (not, as has ignorantly been supposed, that the corresponding limb of the offender is to be cut off), a certain proportionate fine in money is to be paid to the injured. The payment for any of the single limbs of the human body—the nose—is the full price of blood, as for a homicide; for a limb which is found twice, like hand or foot, half; for a finger or toe, the tenth part, etc. Women and slaves have smaller claims. Injuries of a dangerous, or otherwise grievous nature, pay the full price; those of an inferior kind, however, bring the perpetrator within the province of the lash or cudgel, which is supposed to have "come down from heaven, to be used by the judge to palliate the punishment of virtue and duty."

The Koran orders theft—of no less than the value of half a crown—to be punished by cutting off the chief offending limb: the right hand; the second theft is punishable by the loss of the left foot; the third, of the left hand; the fourth, of the right foot, etc.; but the ordinary punishments of imprisonment, hard labor, and the bastinado, have been substituted in our days. The property stolen must not, however, have been of easy access to the thief, nor must it have consisted of food, since he may have taken this to satisfy the craving of his hunger.
Unchastity on the part of a woman was, in the commencement of Islam, punished by imprisonment for life, for which afterward, however, stoning was substituted in the case of a married woman; and a hundred stripes and a year's exile in the case of an unmarried free woman; a slave to undergo only half of that punishment. Yet, it is necessary that he who accuses a "woman of reputation" of adultery or fornication, shall produce four (male) witnesses, and if he be not able to do so, he is to receive fourscore stripes, nor is his testimony ever after to be received, for he is considered an "infamous prevaticator"—unless he swear four times that he speaks the truth, and the fifth time imprecate God's vengeance if he speak false. Yet, even this testimony may be overthrown by the wife's swearing four times that he is a liar, and imprecating the fifth time the wrath of God upon herself, if he speak the truth. In the latter case, she is free from punishment; the marriage, however, is to be dissolved. Fornication in either sex is, by the law of the Koran, to be visited with a hundred stripes.

Infidelity, or apostasy from Islam, is a crime to be visited by the death of the offender, if he have been warned three times without recanting. Severer still, that is, not to be averted by repentance or revocation of any kind, is the punishment inflicted for blasphemy—against God, Mohammed, Christ, Moses, or any other prophet. Instantaneous death is the doom of the offender; for if apostasy may be caused by error and misguidance, "blasphemy is the sign of complete wickedness and thorough corruption of the soul."

A further injunction of the Koran, for the carrying out of which, however, the time has well-nigh gone by, is that of making war against the infidels. He who is slain while fighting in defense and for the propagation of Islam, is reckoned a martyr; while a deserter from the holy war is held up as an object of execration, and has forfeited his life in this world as well as in the world to come. At first, all the enemies taken in battle were ruthlessly slain; later, however, it became the law to give the people of a different faith against whom war was declared the choice of three things: either to embrace Islam—in which case they became Moslems at once, free in their persons and fortunes, and entitled to all the privileges of Moslems; or to submit to pay tribute—in which case they were allowed to continue in their religion, if it did not imply gross idolatry or otherwise offended against the moral law; or to decide the quarrel by the fortune of war—in which case the captive women and children were made slaves, and the men either slain, unless they became converts at the last moment, or otherwise disposed of by the prince. The fifth part of the spoil belongs "to God," that is, the sanctuary (Kaaba, etc.), to the apostle and his kindred, to the orphans, the poor, and the traveler.

We need hardly urge that the Koran is not a systematically arranged code, and that all the laws and regulations hitherto enumerated, although contained in it, either bodily or, as it were, in germs—further developed by the Sunna (q.v.)—are to a great extent only mentioned in an incidental manner, thrown together and mixed up, often in the strangest manner, with the most heterogeneous dicta, dogmas, moral exhortations, civil and criminal laws, etc., and are principally to be considered as supplementary to the existing laws and regulations which they either abrogated, confirmed, or extended, according to the pressing demand of circumstances during the prophet's life. In cases for which subsequent ages found no written rules laid down by the prophet, traditional oral dicta were taken as the norm, and later still, precedents of the caliphs were binding. Hence contradictions in theory and practice have crept in, according to the different traditions and decisions of the imams or expounders of the law, besides the various interpretations put upon the book itself within the pale of the different Mohammedan sects. The secular tribunals, and the distinction between the written civil law of the ecclesiastical courts and the common law, aided by the executive power, is, fortunately for the cause of human culture and the spread of civilization, getting clearer and clearer every day.

That part of Islam, however, which has undergone (because not to be circumscribed and defined by doctors) the least changes in the course of time, and which most distinctly reveals the mind of its author, is also its most complete and its most shining part—we mean the ethics of the Koran. They are not found, any more than the other laws, brought together in one, or two, or three Surahs, but "like golden threads" they are woven into the huge fabric of the religious constitution of Mohammed. Injustice, falsehood, pride, revengefulness, calumny, mockery, avarice, prodigality, debauchery, mistrust, and suspicion are weighed against as ungodly and wicked; while benevolence, liberality, modesty, forbearance, patience and endurance, frugality, sincerity, straightforwardness, decency, love of peace and truth, and above all, trusting in God and submitting to his will, are considered as the pillars of true piety, and the principal signs of a true believer. Nor must we omit to point out expressly that Mohammed never laid down that doctrine of absolute predestination and "fatality" which destroys all human will and freedom, since the individual's deeds cannot alter one iota in his destiny either in this world or in the next. So far from it, foolhardiness is distinctly prohibited in the Koran (ii. 96). Caution is recommended. Prayer, the highest ceremonial law of Islam, is modified in case of danger. It is legal to earn one's livelihood on Friday after prayer, and to shorten the readings in the Koran for the sake of attending to business. All of which is enough to show that the Moslem is not to expect to be fed pursuant to a
divine decree whether he be idle or not. On the other hand, a glance at the whole system of faith, built on hope and fear, rewards and punishments, paradise and hell, both to be man's portion according to his acts in this life, and the incessant exhortations to virtue, and denunciations of vice, are sufficient to prove that aboriginal predestination, such as St. Augustine taught it, is not in the Koran, where only submission to the Lord's will, hope during misfortune, modesty in prosperity, and entire confidence in the divine plans, are supported by the argument, that everything is in the hands of the highest being, and that there is no appeal against his absolute decrees.

And this is one instance of the way in which most of Mohammed's dicta have been developed and explained—both by sectarian and enemies within and without Islam—in such a manner that he has often been made to teach the very reverse of what he really did teach; and thus monstrosities now found in his creed, if carefully traced back to their original sources, will, in most cases, be seen to be the growth of later generations, or the very things he abrogated. That, again, the worst side of his character, the often wanton cruelty with which he pursued his great mission, the propagation of his faith, should by his successors have been taken as a thing to be principally imitated, is not to be wondered at, considering how brilliant the results of the policy of the bloody sword had proved. Scarcely a century had elapsed after Mohammed's death, and Islam reigned supreme over Arabia, Syria, Persia, Egypt, the whole of the northern coast of Africa, even as far as Spain; and notwithstanding the subsequent strifees and divisions in the interior of this gigantic realm, it grew and grew outwardly, until the crescent was made to glare from the five great suns of St. Paul—from Constantinople, and the war cry "Allah Allah resounded before the gates of Vienna. From that time, however, the splendor and the power of Mohammedanism were lost to wane. Although there are counted about 130 millions this day all over the globe who profess Islam, and although it is, especially at this present juncture, making great progress among the African races, yet the number of real and thorough believers is infinitely small; and since it has left off conquering, it has lost also that energy and elasticity which promises great things. Its future fate will depend chiefly, we should say, on the progress of European conquest in the east, and the amount of western civilization which it will, for good or evil, import into those parts.

We cannot consider in this place what Islam has done for the cause of human culture, or, more exactly, what was its precise share in the development of science and art in Europe. We refer to the special articles which treat of these subjects, and particularly to the biographies found in the course of this work of men eminent in every branch of human knowledge who have issued from the ranks of Islam. Broadly speaking, the Mohammedans may be said to have been the enlightened teachers of barbarous Europe from the 9th to the 13th century. It is from the glorious days of the Abbaside rulers, that the real renaissance of Greek spirit and Greek culture is to be dated. Classical literature would have been irredeemably lost, had it not been for the home it found in the schools of the "unbelievers" of the "dark ages." Arabic philosophy, medicine, natural history, geography, history, grammar, rhetoric, and the "golden art of poetry," schooled by the old Hellenic masters, brought forth an abundant harvest of works, many of which will live and teach as long as there will be generations to be taught.

Besides the Koran, the Sunna, and the native (Arabic, Persian, Turkish, etc.) writers on the foregoing subject, we mention as further references the works of the European scholars—such as Avaton, Burckhardt, Hyde, Sprenger, Cliardlu, Reland, D'IHerbelot, Sacy, Hammer, Bureckhardt, Sprenger, Burton, Mitir, Garin de Tassy, Lane, Well, Geiger, Noldeke. See Koran, Mohammed, Shites, Shafites, Sunna, Mohammedan Sects.

MOHAMMEDAN SECTS. "My community." Mohammed is reported to have said, "will separate itself into 73 sects; one only will be saved, all the others shall perish." This prophecy has been largely fulfilled. Even during the illness, and immediately after the death of the founder, many differences of opinion arose among his earliest adherents. We have endeavored to show, both under KORAN and MOHAMMADANISM, how the fundamental book of Islam left certain points undecided by the very fact of its poetical wording, and how, further, the peculiarity of the Arabic idiom at times allowed many interpretations to be put upon one cardinal and dogmatic sentence. To add to this uncertainty, a vast number of oral traditions sprang up and circulated as an expansive corollary to the Koran. Political causes soon came to assist the confusion and contest, and religion was made the pretext for faction-fights, which in reality had their origin in the ambition of certain men of influence. Thus "sects" increased in far larger numbers even than the prophet had foretold, and though their existence was but short-lived in most instances, they yet deserve attention, were it only as signs and tokens of the ever-fresh life of the human spirit, which, though fettered a thousand times by narrow and hard formulas, will break these fetters as often, and prove its everlasting right to freedom of thought and action.

The bewildering mass of these currents of controversy has by the Arabic historians been brought under four chief heads or fundamental bases. The first of these relates to the divine attributes and unity. Which of these attributes are essential or eternal? Is the omnipotence of God absolute? If not, what are its limits? Further, as to the doctrine-
of God's predestination and man's liberty—a question of no small purport, and one which has been controverted in nearly all "revealed" religions—How far is God's decree influenced by man's own will? How far can God connivence evil? And questions of a similar kind belonging to this province. The third is perhaps the most comprehensive "basis," and the one that bears most directly upon practical doctrines—viz., the promises and threats, and the names of God, together with various other questions chiefly relating to faith, repentance, infidelity, and error. The fourth is the one that concerns itself with the influence of reason and history upon the transcendental realm of faith. To this chapter belong the mission of prophets, the office of Iman, or head of the church, and such intricate subtleties as to what constitutes goodness and badness; how far actions are to be condemned on the ground of reason or the "law," etc.

One broad line, however, came to be drawn, in the course of time, among these innumerable religious divisions, a line that separated them all into orthodox sects and heterodox sects; orthodox being those only who adopted the oral traditions or Sunna (see Sunni).

Much more numerous than the orthodox divisions are the heterodox ones. Immediately after Mohammed's death, and during the early conquests, the contest was chiefly confined to the question of the Imamat. But no sooner were the first days of warfare over, than thinking minds began to direct themselves to a closer examination of the faith itself, for which and through which the world was to be conquered, and to the book which preached it, the Koran. The earliest germs of a religious dissension are found in the revolt of the Kharejites against Ali, in the 37th year of the Hegira; and several doctors shortly afterwards broached heterodox opinions about predestination and the good and evil to be ascribed to God. These new doctrines were boldly, and in a very advanced form, openly preached by Wasi Ibn Aan, who, for uttering a moderate opinion in the matter of the "sinner," had been expelled from the rigorous school of Basra. He then formed a school of his own—that of the Separatists or Motazilites (q.v.), who, together with a number of other "heretical" groups, are variously counted as one, four, or seven sects.

We now come to the second great heretic group, the Seftatians. The Seftatians (attributiohists), held a precisely contrary view to that of the Motazilites. With them, God's attributes, whether essential or operative, or what they afterwards called declarative or historical, i.e., used in historical narration (eyes, face, hand), anthropomorphisms, in fact, were considered eternal. But here, again, lay the germs for more dissonant and more sects in their own midst. Some taking this notion of God's attributes in a strictly literal sense, assumed a likeness between God and created things; others giving it a more allegorical interpretation, without, however, entering into any particulars beyond the reiterated doctrine, that God had no companion or similitude. The different sects into which they split were, first, the Asharites, so called from Abul Hasan al Ashari, who, at first a Motazilite, disagreed with his masters on the point of God's being bound to do always that which is best. He became the founder of a new school, which held (1) that God's attributes are to be held distinct from his essence, and that any literal understanding of the words that stand for God's limbs in the Koran is reprehensible. (2) That predestination must be taken in its most literal meaning, i.e., that God preordains everything. The opinions on this point of man's free will are, however, much divided, as indeed to combine a predestination which ordains every act with man's free choice is not easy; and the older authors hold it is well not to inquire too minutely into these things, lest all precepts, both positive and negative, be argued away. The middle path, adopted by the greater number of the doctors, is expressed in this formula: There is neither compulsion nor free liberty, but the way lies between the two; the power and will being both created by God, though the merit or guilt be imputed to man. Regarding moral sin, it was held by this sect that if a believer die guilty of it without repentance, he will not, for all that, always remain a denizen of hell. God will either pardon him, or the prophet will intercede on his behalf, as he says in the Koran: "My intercession shall be employed for those among my people who shall have been guilty of grievous crimes;" and further, that he in whose heart there is faith but of the weight of an ant, shall be delivered from hell-fire. From this more philosophical opinion, however, departed a number of other Seftatian sects, who, taking the Koranic words more literally, transformed God's attributes into grossly corporeal things, like the Mosshabehites, or Assimilators, who conceived God to be a figure composed of limbs like those of created beings, either of a bodily or spiritual nature, capable of local motion, ascent, or descent, etc. The notions of some actually went so far as to declare God to be "hollow from the crown of the head to the breast, and solid from the breast downward; he also had black curled hair." Another subdivision of this sect were the Jabarians, who deny to man all free agency, and make all his deeds dependent on God. Their name indicates their religious tendency sufficiently, meaning "Necessitarians."

The third principal division of "heretical sects" is formed by the Kharejites, or "rebels" from the lawful prince—i.e., Ali—the first of whom were the 12,000 men who fell away from him after having fought under him at the battle of Selc'vin, taking offense at his submitting the decision of his right to the caliphat (against Mawiyuh) to arbitration. Their "heresy" consisted, first, in their holding that any man might be called to the Imamat though he did not belong to the Koorish, nor was even a freeman, provided
he was a just and pious man, and fit in every other respect. It also followed that an
unrighteous Imam might be deposed, or even put to death; and further, that there was no
absolute necessity for any Imam in the world.

Of the fourth principal sect, the Shiites, or "Sectaries," the followers of Ali Ibn Abi
Taleb, we have spoken under that special heading.

It remains only to mention a few of the many pseudo-prophets who arose from time
to time in the bosom of Islam, drawing a certain number of adherents around them,
and threatening to undermine the church founded by Mohammed, by either declaring
themselves his legal successors, or completely renouncing his doctrines. The first, and
most prominent among these, was Mosayliman (q.v.). Next to him stands Al-Aswad,
originally called Alhala, of the tribe of Aus, of which, as well as of that of a number of
other tribes, he was governor. He pretended to receive certain revelations from two
angels, Solaik and Shoraik. Certain feats of legendarism, and a natural eloquence,
procured him a number of followers, by whose aid he made himself master of several
provinces. A counter-revolution, however, broke out the night before Mohammed's
death, and Al-Aswad's head was cut off; whereby an end was put to a rebellion of exactly
four months' duration, but already assuming large proportions. In the same year (11
Hegira), but after Mohammed's death, a man named Toleila set up as prophet, but
with very little success. He, his tribe and followers, were met in open battle by Khalid,
and at the head of the troops of the faithful, and being beaten, had all finally to submit to
Islam.

A few words ought also to be said regarding the "veiled prophet," Al-Mokanna, or
Borkai, whose real name was Hakem Ibn Hashem, at the time of Al-Mohdi, the third
Abbaside caliph. He used to hide the deformity of his face (he had also but one eye) by
a gilded mask, a circumstance which his followers explained by the splendor of his
comeliness being too brilliant (like that of Moses) to be borne by ordinary mortals.
Being a proficient in juggling besides, which went for the power of working miracles,
he soon drew many disciples and followers around him. At last he arrogated the office
of the Deity itself, which, by continual transmigrations from Adam downward, had at
last resided in the body of Abu Moslem, the governor of Khorassan, whose secretary
this new prophet had been. The caliph, finding him growing more and more formidable
every day, sent a force against him, which finally drove him back into one of his
strongest fortresses, where he first poisoned and then burned all his family; after which
he threw himself into the flames, which consumed him completely, except his hair. He
had left a message, however, to the effect that he would reappear in the shape of a gray
man, sitting on a gray horse, and many of his followers for many years after expected
his reappearance. They wore, as a distinguishing mark, nothing but white garments.
He died about the middle of the 2d c. Hegira.

Of the Karthumians and the Isma'illis, we have spoken under these special headings.
We can scarcely enumerate among the prophets Abul Teyeb Ahmed Al-Motanebeli, one
of the most celebrated Arabic poets, who mistook, or pretended to mistake, his poetical
inspirations for the divine allatius, and caused several tribes to style him prophet, as
his surname indicates, and to acknowledge his mission. The governor of his province,
Lulh, took the promptest steps to stifle any such pretensions in the bud, by imprisoning
him, and making him formally renounce all absurd pretensions to a prophethcal office.
The poet did so with all speed. He was richly rewarded by the court and many princes
for his misdeeds, to which henceforth he cling exclusively; but the riches he thus
accumulated became the cause of his death. Robbers attacked him while he was returning
from his home in the desert, and seized upon the treasure bestowed upon him by Ada-
foodawla, sultan of Persia.—The last of these new prophets to be mentioned is Baba,
who appeared in Amasia, in Natalia, in 638 Hegira, and who had immense success,
chiefly with the Turkmuns, his own nation, so that at last he found himself at the head
of nearly a million men, horse and foot. Their war-cry was, God is God, and Baba—
not Mohammed—is his prophet. It was not until both Christians and Mohammedans
combined for the purpose of self-defense, that this new and most formidable power was
annihilated, its armies being routed and put to the sword, while the two chiefs were
decapitated by the executioner.

MOHAVE, a co. in n.w. Arizona, having the navigable Rio Colorado for its w.
boundary, separating it from California, and the Bill Williams river and Santa Maria
creek for its s. boundary; about 6,500 sq. m.; pop. 76, 822. Its surface is mountainous,
largely covered with timber, and with broad valleys varying from 2 to 10 m. in width.
Its soil is for the most part unproductive, but the river banks are susceptible of cultiva-
tion, bearing now a wild growth of cottonwood, mesquite, and the nutritious grass that
furnishes good pasturage. It contains the celebrated cañon of the Colorado, a stupen-
dous chasm with rocky walls from 3,000 to 6,000 ft. high extending for 300 miles. Gold,
copper, and lead are found; and it has rich silver mines and quartz mills. Its trade is

MOHAVE DESERT, a valley in s. California lying principally in s. Bernardino
county. It is a desert only in name, as large parts of it afford good pasturage, and
water is easily procurable in wells, though the streams in the valley are small, and do
not flow into the ocean. In some portions the summer heat is intense, and vegetation is scanty. Much of the district is said to be below the level of the sea. Mohave river, in s. Bernardino co., California, flows e.n.e., and is lost in the Mohave desert.

MOHA'VES, the name of a tribe of Indians who occupy lands along the Colorado and Mohave rivers, in Arizona. They belong to a nation of the Pima family—the Yumas—and are naturally a brave and warlike race, though not quarrelsome. They favor agriculture as a pursuit more than most of the tribes, and some of them are semi-civilized in their manner of living, occupying decently constructed dwellings. About 1000 of them dwell on a reservation appointed by the U. S. government, comprising about 130,000 acres. The remainder, twice or three times as many, are scattered. They are rapidly diminishing in numbers through the influence of disease. No attempt is being made to educate them, nor are there any missions among them.

MOHAWK, a river of New York, named from a tribe of Indians. It rises in Oneida county, 20 m. n. of Rome, and runs e.s.e. into the Hudson at Waterford, 10 m. above Albany. It is 135 m. long, and has numerous and picturesque waterfalls, especially at Little Falls, Cohoes, and Waterford, affording abundant water-power. In its populous valley are the Erie canal and New York Central railway.

MOHAWKS. See AGEGIE.

MOHICANS, MOHEGANS, or MAHICANNI, once a powerful and warlike sub-tribe of North American Indians, of the great Algonquin family, which, in the 17th c., inhabited the territory n.w. of Long island sound, and e. of the river Hudson, now included in the states of New York, Connecticut, and Massachusetts. Being compelled to give way to the conquering Iroquois confederacy, they retired to the valley of the Hoosatonic river in Connecticut, and were consequently one of the first tribes who came into collision with, and were dispossessed of their territory by the early British settlers. They subsequently lived dispersed among the other tribes, and all traces of them have now nearly disappeared. Their name has become widely known through Mr. J. Fenimore Cooper's celebrated novel, The Last of the Mohicans.

MOHILEV, or MOGLIEV, a government of European Russia, lying between Minsk and Smolensk, contains 18,500 English sq.m., with a pop. (1879) of 947,625. The inhabitants are mostly Russiaks, though there are also many Russians, Germans, Jews, and even Bohemians. The country is generally a plain, with here and there an occasional undulation; the soil is very fertile, and the climate most agreeably mild. Agriculture has here reached a high degree of perfection, and the same may be said of arboriculture and horticulture. The natural pasturage is of fine quality, and affords abundant nourishment to immense herds of cattle. The forests are extensive. The country is watered by the Dnieper and its numerous affluents, which form the means of communication with the Black sea ports, and of the transit of corn, timber, and masts, of which last large quantities are annually floated down to Kherson. Bog iron-ore is found in abundance. The inhabitants are celebrated for their activity and industry; and Mohilev, from its great natural advantages, has now become one of the richest provinces of Russia. In early times, Mohilev belonged to the territory of the Russian prince of Smolensk but was subsequently conquered by the grand duke of Lithuania, and was, along with Lithuania, united to the kingdom of Poland. In 1772 it was seized by Russia at the first partition of Poland; and in 1796 was joined to the government of Vitebsk, under the name of White Russia; but since 1802 it has formed a separate government.

MOHILEV, or MOGILEV, the capital of the government of the same name in European Russia, and one of the finest towns of Russia, is situated in the center of the government, on the right bank of the Dnieper, 100 m. s.w. of Smolensk. It is the seat of a Greek archbishop, and of the Roman Catholic primate of Russia and Poland, besides being the favorite residence of many of the Russian nobility. It possesses a fine Greek cathedral, built in 1780, 20 Greek, 1 Lutheran, and 4 Roman Catholic churches, several synagogues, and a variety of religions, educational, and charitable institutions. Its streets are wide, straight, and well paved, and there is a fine promenade bordered with trees, whence a beautiful view of the valley of the Dnieper is obtained. Pop. '67, 38,922, of whom one-third are Jews. There is a large export trade to the chief ports of the Baltic and Black seas.

MOHILEV, or MOGLOW, a district town on the s.w. frontier of the government of Podolia. European Russia, is situated on the left bank of the Dniester, 50 m. e. by s. from Kam' nieuz, Pop. '67, 9,758. It carries on an active trade with the adjacent Russian provinces, and with the Turkish principalities of Moldavia and Wallachia. The climate is so mild, that silk and other products of warm climates are extensively produced.

MOHIL, Heggo, von, 1805–72, b. Stuttgart; studied medicine and natural sciences at Tübingen, and was professor of botany and director of the botanic garden in Tübingen 1835. His works were numerous, and he is of high authority on vegetable physiology.
MOHL, JULIUS VON, b. at Stuttgart, 1800; studied Persian and Chinese at Tiibingen, Paris, London, and Oxford; was professor of oriental literature in Tiibingen, 1826-32: went to Paris and became professor of Persia at the college de France in 1845, and in 1852 director of the oriental department of the national printing-office. His principal work is his edition of Firdusi's Shah Nameh, and many Chinese and other oriental works. He published also Dante et les origines de la litterature italienne.

MOHLER, JOHANN ADAM, one of the most distinguished modern polemical divines of the Roman Catholic church, was b. of humble parentage at Igersheim, in Wurttemberg, May 6, 1796. He received his early education at the gymnasium of Mengentheim, whence, in his 17th year, he was transferred, for the higher studies, to the lyceum of Efiingen; and soon afterward entered upon the theological course in the university of Tiibingen. He received priest's orders in 1819, and for a short time was employed in missionary duty; but, in 1820, he returned to college life, for two years was engaged as classical tutor; but, in 1822, the offer of a theological appointment in the university of Tiibingen finally decided his choice of the study of divinity. He was permitted, before entering on his studies, to spend some time in making himself acquainted with the routine of the theological courses of other universities—as Gottingen, Berlin, Prague, Vienna, and Landsbut; and in 1823 he entered upon his new position. In 1828, in which year he was also admitted to the degree of doctor of divinity, he was appointed ordinary professor of theology. His earliest publication was a treatise On the Unity of the Church (1825), which was followed, in 1827, by a historic-theological essay on Athanasius and the Church of his Time, in Conflict with Arius. But his reputation, both posthumous and among his own contemporaries, rests mainly on his well-known Symbolism; or the Doctrinal Differences between Catholics and Protestants, as represented by their Public Confessions of Faith (1832). This remarkable book at once fixed the attention of the theological world. It passed through five large editions in six years. It was translated into all the leading languages of Europe, and drew forth numerous criticisms and rejoinders, the most considerable of which is that of Dr. F. C. Baur (q.v.), 1833. To this Mohler replied in 1834, by a work entitled Further Researches into the Doctrinal Differences of Catholics and Protestants. The polemical bitterness evoked by these controversies made it desirable that Mohler should leave the university of Tiibingen. He was invited to Beshan, and also to Bonn, but ultimately selected (1835) the university of Munich, then in the first flush of its efficiency, under king Louis. His first appointment was nominally the chair of biblical exegesis, but he really devoted himself to the department of church history; and when his opening course was eminently successful; but, unhappily, a naturally delicate constitution began to give way under the constant fatigues of a student's life; and although he continued, under all these disadvantages, to maintain and to add to his reputation, and although, in 1837, the invitation to the Bonn professorship was renewed in still more flattering terms, he gradually sunk under consumption, and died April 12, 1838. His miscellaneous works were collected and published posthumously, in 2 vols. 8vo (1839-40), by his friend, the now celebrated Dr. Doblinger. Mohler may be regarded as at once the most acute and the most philosophical of the modern controversialists of his church. He deals more, however, with the exposition of the points and the grounds of the doctrinal differences of modern sects, than with the discussion of the scriptural or traditional evidences of the peculiar doctrines of any among them.

MIDORE, a former gold coin of Portugal, of the value of 4,800 reis, or nearly 27s. sterling. It was also called tibonine.

MOIGNO (DE VILLEBEAU), FRANCOIS NAPOLEON MARIE, 1804; b. in Morbihan, France; educated in Jesuit schools and colleges; was made abbe in 1830. In 1836 his advancement in mathematical studies gave him a professorship in Paris. He afterwards contributed articles on religious subjects to the Encyclopaedia and other church journals, and in 1849 published Lecons de Calendrier Differenciel et Integral. In 1844 he became the scientific director of church history; and when his traveling course was eminently successful; but, unhappily, a naturally delicate constitution began to give way under the constant fatigues of a student's life; and although he continued, under all these disadvantages, to maintain and to add to his reputation, and although, in 1837, the invitation to the Bonn professorship was renewed in still more flattering terms, he gradually sunk under consumption, and died April 12, 1838. His miscellaneous works were collected and published posthumously, in 2 vols. 8vo (1839-40), by his friend, the now celebrated Dr. Doblinger. Mohler may be regarded as at once the most acute and the most philosophical of the modern controversialists of his church. He deals more, however, with the exposition of the points and the grounds of the doctrinal differences of modern sects, than with the discussion of the scriptural or traditional evidences of the peculiar doctrines of any among them.

MOIR, DAVID MACBETH, 1798-1851; b. at Musselburgh, Scotland; was educated at the grammar school, and at the age of 13 was apprenticed for four years to Dr. Stewart, a medical practitioner. At the close of his apprenticeship he finished his course at Edinburgh, and received his diploma as surgeon in 1816. Towards the close of his college course he sent forth an anonymous publication entitled The Bombardment of Algiers and other Poems. In 1812 he appeared in print with two short essays in prose in a local magazine. Returning home he devoted himself to literature. In 1817 he joined Dr. Brown as a partner in an extensive medical practice in Musselburgh. His evenings and nights he spent in literary study. Having previously contributed in prose and verse to
the Scot's Magazine and to Constable's Edinburgh Magazine, he became a constant contributor in prose and verse to Blackwood's Magazine, which was started about that time. His verse was both comic and serious. Among his clever comic effusions were The Era of St. Jerry and The Axe of the Wagonner. His serious poems had the signature A., from which he obtained the literary cognomen of Delia. His connection with Blackwood continued till his death. In 1823 he formed a strong friendship for John Galt, the novelist, who, being suddenly called off to America before finishing his novel The Last of the Lairds, commissioned Moir to write the concluding chapters for him. In 1824 he published The Legend of Genivieve and other Tales and Poems, comprising selections from his magazine articles, with some original additions. In 1824 he began in Blackwood his novel of The Autobiography of M. de Rocque, which was continued for nearly three years, and published in a volume. Though urged to remove to the metropolis, where he would have a more literate practice and a larger circle of literary friends, he preferred the scenes of his early days and his practice among the poor. His practice was so extensive that for ten successive years he never slept a night out of Musselburgh. In 1829 he published Outlines of the Ancient History of Medicine, being a View of the Healing Art among the Egyptians, Greeks, Romans, and Arabians. In 1832 he greatly exerted himself to check the cholera, and published, as secretary of the board of health, Practical Observations on Malignant Cholera, and Proofs of the Contagion of Malignant Cholera. In 1843 he published Domestic Verses, in which he records with tenderness the loss of his two sons. In 1846 he was thrown from a carriage and rendered lame for life. In 1851 he delivered a course of six lectures on the poetical literature of the past half century at the Edinburgh philosophical institution, which were afterwards published. In the same year he published Sélim, his last contribution to Blackwood's Magazine. His contributions to Blackwood alone number 370. The poems of Moir are graceful and pathetic. A selection of his poetical works in two volumes was published by Thomas Aird with a memoir of the author.

MOIRA, EARL OF. See Hastings, Francis Rawdon.

MOIRE, the French name (formerly moheire, and supposed to be taken from the Eng. moheir, which is itself probably of eastern origin) applied to silks figured by the peculiar process called watering. The silks for this purpose must be broad and of a good substantial make; thin and narrow pieces will not do: they are wetted and then folded with particular care to insure the threads of the fabric lying all in the same direction, and not crossing each other except as in the usual way of the web and the warp. The folded pieces of silk are then submitted to an enormous pressure, generally in a hydraulic machine. By this pressure the air is slowly expelled, and in escaping draws the moisture into curiously waved lines, which leave the permanent marking called watering. The finest kinds of watered silks are known as moires antiques.—The same process has been applied to woolen fabrics called moireen, which is only an alteration of the word moire.

MOIREE METALLIQUE, a French term applied to tin-plate upon which a peculiar figuring like that caused by frost on windows is produced by dipping plates, in a heated state, into nitro-muriatic acid, and then washing with water to remove the acid. When dry the plates are varnished or lacquered, and have a pretty effect. The cheapness and ease of the process have made it very common for inferior articles in tin.

MOISSAC, a t. of France, in the department of Tarn-et-Garonne, on the river Tarn, 15 m. n.w. of Montauban. The church of St. Pierre dates from the year 1190, and contains some excellent carvings and curious fantastic sculptures. Moissac is the center of an important trade in grain. Pop. 78, 767.

MOKAN'NA, or AHA-BEN-HAKEM. See Mohammedan Sects, ante.

MOLA, a city and sea-port of the Italian province of Bari, delightfully situated among gardens and olive groves on the Adriatic, 13 m. from Bari. It contains fine churches and other edifices, and excellent streets. From all accounts it seems to have exceedingly little trade of any kind. Pop. 12,181.

MOLASSE, See Molasse, ante.

MOLASSES, See Sugar.

MOLAY, Jacques de, 1244-1314; b. Burgundy; of the families of Longy and Raon. Nothing is known of his early life but that he was admitted to the order of knights templars at Baune, in the diocese of Autun, and was promoted to be grand-master about 1298. This was in the reign of Philip IV., who was endeavoring to replace the feudal system in France by a powerful monarchy, and who viewed with fear and distrust the growing influence of the knights templars. The success which had characterized the crusades and which had been largely the work of this and the other Christian orders, had now deserted them. Syria had again fallen a prey to the Mohammedans, and the knights templars and hospitals had retired to Cyprus, whence they sent forth a cry for help to the Catholic hierarchy and the Christian powers throughout
Europe. But Europe was itself torn by the dissensions of petty potentates. De Molay, however, determined to effect by strategy what he could not control by force; and taking advantage of the movement of the Mogul Tartars against Syria and Egypt, ingratiated himself with the grand khan, and actually received command of one wing of his army, with which he invaded Syria in the spring of 1299. With the troops under his control he recovered Jerusalem from the infidels, and so awakened enthusiasm that a new crusade was urged upon the pope and the kings of France and England. But the unexpected success which had been achieved by Tartar aid was short-lived. In the following year the army of the grand khan was destroyed and Jerusalem again lost to the Christians. The templars returned to the island of Tortosa near Tripoli, with Jacques de Molay still at their head. They were attacked and defeated in 1302, and obliged to flee to Cyprus. It was now that Philip IV. undertook to carry out the project which he had formed to destroy the order whose supremacy he feared. The order was at this time powerful, well-organized—comprising most of the great nobles of Europe—and wealthy to a degree to excite the cupidty of so greedy a monarch as Philip. In the grasp of a mind so broad and a temperament so energetic as those of De Molay, its possible future might well occasion dread to the ambitious and envious. With a design to impose upon the credulity of De Molay, Philip pretended to be anxious for a new crusade, and at his instigation Clement V. called the grand masters of the templars and hospitalers to Europe. The call was answered by De Molay, among the rest, who appeared in Paris in Aug., 1306, accompanied by a chosen band of distinguished knights of the order, and loaded with treasure. He made a triumphal entry into the capital, a fact which did not tend to allay the suspicions or alter the determination of the king, though he received his visitor with hospitality. The intelligence which the pope, De Molay took the opportunity to ask an investigation of sinister rumors which had been spread abroad by the enemies of the order. The pope, under the influence of Philip, directed that such an investigation should be undertaken; when the latter, assuming the order to be permission for active proceedings against the order, procured the arrest of every templar in France, and Oct. 13, 1307, Jacques de Molay was seized in the house of the temple and summoned before the inquisition. Although the pope was indignant at this liberty on the part of Philip, and took action to suspend the power of the inquisition in the premises, the king persisted in his determination, and in May, 1310, caused 34 of the templars to be burned at the stake. De Molay was now put under examination by a papal commission, and was condemned to death. He was dragged to the stake, loaded with fetters, "a feeble old man, bent and whitened by age and captivity," and died protesting to the end the innocence of the order—of which he was the last grand-master.

Mold (anciently Monte Alto; Welsh, Wyddgrug), a parliamentary borough in the county of Flint, situated on the Alun, 12 m. W.S.W. of Chester. Though Flint is the county town, the assizes and quarter-sessions for the county are held here. The town possesses a good market, a fine old church, and several dissenting chapels. It is connected with England by a branch of the Chester and Holyhead railway. The neighborhood abounds with mineral wealth, coal and lead being the principal produce; it has also numerous interesting relics of antiquity—e.g., so-called Druidic circles, Roman roads and encampments, Saxon earthworks, an ensign called Bryn Bili (formerly surmounted by a castle), and a castellated building known as the tower of Rheinallt ab Gruffydd, the two latter having been scenes of frequent contentions between the English and Welsh. Many old families have mansions in the neighborhood, whose pleasing variety of scenery renders it attractive. Pop. of parliamentary borough (1871), 4,534.

Moldau (Bohemian, Vltava), the chief river of Bohemia, and an important tributary of the Elbe, rises in the Bohemwald mountains, on the s.w. frontier, at an elevation of 3,750 ft. above the level of the sea, and flows s.e. to Hohenfurth, where it bends northward, and pursues that direction to its confluence with the Elbe opposite Melnik, after a course of 270 miles. Its course to the point of confluence is longer than that of the Elbe, and the navigation of that river is greatly facilitated by the body of water which it contributes. It succeeds on the left, or Westewn and the Beran; and on the right, the Lischitz and the Szawa. The chief towns on its banks are Kraum, Budweis, and Prague. It becomes navigable from Budweis.

Moldavia and Wallachia, two states forming the so-called Dacian Principalities, which, since Dec. 23, 1861, have been united under one prince and one administration, and officially bear the single name of Roumania or Romania. Formerly subject to the Porte, Romania proclaimed its own absolute independence in 1857, and had its claim recognized at the Berlin Congress of 1878. Reliable statistics as to the Dobrudscha (q.v.), then granted to Roumania in return for Rommanian Bessarabia (q.v.), ceded to Russia, are not yet forthcoming.

1. Moldavia (Ger. Moldau, Turk. Bogdan) is bounded on the n. and e. by Russia, on the s. by Wallachia, and on the w. by Hungary. Area, since the cession of Bessarabia, about 15,000 sq. miles. The country forms, geographically, part of the great plain of south Russia, except towards the w., where there are spurs from the Carpathians. It is watered by the Pruth, the Sereth, and the Danube, and is almost everywhere fertile, pro-
Moldavia.

ducing considerable quantities of grain, fruit, and wine. But the riches of the country consist mainly in its cattle and horses, of which immense numbers are reared on its splendid and far-stretching pastures; swine and sheep are also numerous; and the rearing of bees, owing to the multitude of lime-trees, is extensively carried on. The great plains of the land are locusts and earthquakes. Minerals and precious metals are said to be abundant, but they have not yet been worked. The mountains of Oltau and the Carpathian mountains. Trade is almost exclusively in the hands of the numerous Jews, Germans, Greeks, and Russians who have settled in the country. The capital of Moldavia is Jassy (q.v.); but the great center of trade is Galatz (q.v.), where, of late, several British merchants have established houses. The principal exports are grain, wool, lambs’ skins, hides, feathers, maize, tur, tallow, honey, beeswax, cattle, and salt (in blocks); the imports are chiefly the manufactured products of Western Europe. Moldavia is divided into 13 districts, each of which has a prefect or governor, a receivers-general of taxes, and a civil tribunal consisting of a president and two other judges.

2. Wallachia, the larger of the united Danubian principalities, is bounded on the n. by the Austrian empire and Moldavia, on the e. and s., by the Danube, and on the w. by the Austrian empire and the Danube. Length from the western frontier to cape Kalakra on the Black sea, 205 m.; greatest breadth, 150 m.; area, 27,500 sq. miles. The greater part of Wallachia is quite flat; but in the n., where it borders on Hungary and Transylvania, it gradually rises up into a great mountain-wall, impassable save in five places. It is destitute of wood throughout almost its whole extent; and especially along the banks of the Danube, is covered with marshy swamps, miles upon miles in breadth. The principal river flowing through the country is the Aluta, which joins the Danube at Nikopol. The climate is extreme: the summer heats are intense; while in winter, the land lies under deep snow for four months. The principal products are corn, maize, millet, wine, flax, tobacco, and olive-oil. The vast treeless heaths afford sustenance to great herds of cattle, sheep, and horses. As in Moldavia, agriculture is an important branch of industry; and the swampy districts of the south are haunted by immense numbers of wild water-fowl. In minerals—especially gold, silver, copper, and rock-salt—the soil is rich, but only the last of these is extensively worked. Bucharest is the capital of Wallachia and of Roumania. The pop. of Roumania, though the loss of Bessarabia was not balanced by the gain of the Dobrudzha, was still estimated in 1876 at near 5 millions.

Administration.—The ruler of the principalities—styled by the Roumans domnii or domnitor; officially called by the sublime porte voisel (prince); by the Turks generally, ijaner-effendii (lord of the unbelievers); and by the Russians, hospodar or gospodari (prince)—receives his investiture from the sultan, but is otherwise independent. By the treaty of Paris (1856) and the convention (1858), Moldavia and Wallachia were politically united under one prince, with a special ministry for each country, two elective assemblies, and a central commission, which had its seat at Fokshani. But in Nov., 1861, the sultan sanctioned the administrative union of the two states; and in the following month it was publicly proclaimed at Bucharest and Jassy. The first ruler of Roumania, Prince Alexander John Corn, was forced to abdicate in 1866, when Karl h., son of the count of Hohenzollern-Sigmaringen, was chosen his successor. At the same time a new and more popular constitution was adopted by a constituent assembly elected by universal suffrage. The legislative power is vested in two houses, a senate and a chamber of deputies. The former consists of 76 and the latter of 157 members, of whom 82 are for Wallachia and 75 for Moldavia. The members of both houses are chosen by indirect election—i.e., the first voters nominate electors, who choose the members. All citizens who have reached their 25th year, and who can read and write, are voters in the first instance, and every Rouman who possesses a small yearly income is eligible for a seat in parliament. The prince has a suspensive veto over all laws passed by both chambers. He is also chief of the executive, which is composed of a council of seven ministers, heads of the departments of the interior, of foreign affairs, of war, of finance, of justice, of commerce and agriculture, and of religion and public instruction. Judges and the executive at the request of the superior authorities. The legal code are founded upon the civil law and the customs of the principalities; but though the system of jurisprudence has been much amended, many reforms remain to be effected, especially in the administration of the laws, which is said to be most corrupt.

Religion.—The established religion of Roumania is that of the Greek church, to which nearly the whole population belong; but all forms of Christianity are tolerated, and their professors enjoy equal political rights. At the head of the Greek clergy stand the metropolitan archbishops of Moldavia and Wallachia, the latter of whom is primate of Roumania. Every bishop is assisted by a council of clergy, and has a seminary for priests; the superintendent of the preaching clergy is the proto-papa of the diocese. The ecclesiastical wealth of the country was formerly very great, but the increased expenditure that followed the union of the two states rendered the scheme of raptoilie the only means left to the government to extricate itself from its difficulties—indeed, in a word, the convent-properties were wrested from the hands of the Greek monks, and placed under the administration of the state. It had been the fashion to establish such convents in Turkey as supports to the orthodox faith, and the institutions in the principality itself were richly endowed in land and other ways: it was resolved to apply the revenues
to the relief of national needs, such as schools, hospitals, the support of the poor, etc., and to give only the overplus to the clergy. This has considerably increased the revenue of the state. The administration, however, is now put upon a better footing.

Education.—There are upwards of 2,000 elementary schools, besides normal schools, gymnasia, private schools, etc., in all about 2,500 schools. There are two universities. Education is gratuitous and compulsory. There are numerous French boarding-schools, and French is now the language of the educated circles, especially ladies (as Greek used to be), but the state language and the proper national tongue is the Romanian.

Army.—The military force of Roumania is organized on the plan of the Russian army, and the staff-officers are principally Russian. The militia is formed by the peasantry in the proportion of two men for every 100 families; but along the banks of the Danube all the inhabitants capable of bearing arms are organized into a military force. By the law of 1877 all natives of Roumania from twenty to forty are liable to military service in the standing army, four years active and four in the reserve. The militia is composed of all who have been in the standing army at any age between twenty and thirty-six. In 1877 the entire Romanian military force numbered 144,668 men, but of these only 42,449 belonged to the regular or "permanent" army.

Commerce.—The total value of the imports of Roumania in 1874 amounted to 92,000,000 lei (≈ franc), or about £3,700,000; and of the exports, 158,000,000 lei, or about £6,320,000. The principal article of export is grain, especially wheat and maize. Romanian industry has largely profited by the construction in recent years of several lines of railway. In 1869 the first line, 42 English miles in length, was opened from Bucharest to Giurgeo at the Danube, and in subsequent years a network of railways was completed, connecting the capital with Western Europe through the towns of Ploesti, Buzau, Braila, Telekach, Roman, and Suceava, and from thence to Lemberg in Austria. In 1878 there were about 300,000 miles of telegraph in the principalities. The estimated revenue in 1879 was £1,383,500, just balanced by the expenditure; the public debt was, in 1880, about £24,400,000.

Race, Language, and Literature.—The great majority of the inhabitants are known in western Europe as Wallachs, but they call themselves Români. The Wallachs, however, are not confined to the principalities, but inhabit also the southern part of Bukowina, the greater part of Transylvania, eastern Hungary, a part of the Banat, Bessarabia, some districts in Podolia and Kherson, and portions of eastern Servia. They are also found in Macedonia, Albania, and Thessaly. They are a mixed race, produced by the amalgamation of the emperor Trajan's Roman colonists with the original Dacian population, and subsequently modified by Greek, Gothic, Slav, and Turkish elements. This mixture is seen in their language, three-fourths of the words of which are Latin (the Dacian has disappeared), while the remaining fourth is made up of words from the other four languages. Wallachian literature is rich in popular songs; since the 16th c., many works in prose and verse have been printed, and of late years two political journals in the Wallachian tongue have been established, one at Bucharest, and another at Jassy. A Grammaria Ducio-Rumania was published by Johann Alexi (Vienna, 1826); and a Historia Linguae Ducio-Rumania by Laurianus (Vienna, 1849). A large Latin-ROMANIC-Hungarian dictionary was carefully executed by the bishop of Fagarasch, Joh. Bob (3 vols, Klausenburg, 1839).

Social Condition.—Very recent statistics on this point are not attainable. In Moldavia there are rather less, in Wallachia considerably more than 3,000 bojars, besides whom there is an extensive inferior nobility. In Wallachia every twenty-eighth man is a nobleman; every one hundred and thirty-third a merchant; and in the capital every twentieth is a merchant. The free peasants, or yeomen, called Brătșea, are not numerous—in all Wallachia there are under 5,000. Gipsy communities are an important element in the population; upwards of 150,000 of this mysterious race are or were subjects belonging to the rich bojars and the monasteries. In 1844 about 50,000 were emancipated, and settled in colonies in different parts of the land; they call themselves Români, or Români. The common people are on the whole good-humored, frugal, sober, and cleanly; murder and larceny are almost unknown. Their dwellings, however, are, as may be supposed, of the most wretched description; composed chiefly of interlaced willow-witches, covered with mud, cane, and straw.

History.—In the ancient times Moldavia and Wallachia formed an important part of Dacia (q.v.), and the two countries have in general experienced the same vicissitudes. At the period of the ancient nations and in the following centuries they were the scene of the struggles between the Gothic, Hunnic, Bulgarian, and Slav races—the Avari, Chazars, Petchenegi, Uzd, and Magyars, who alternately ruled or were expelled from the country. These peoples all left some traces (more or less) of themselves among the Romanian Dacian inhabitants, and thus helped to form that composite people, the modern Wallachs. In the 11th c. the inhabitants of Moldavia and Wallachia were converted to the Christianity of the Eastern or Greek church. Their incursions, however, frightfully devastated the country. In the 11th c., the Kuman, a Turkish race, established in Moldavia a kingdom of their own. Two centuries later the great storm of Mongols broke over the land. It now fell into the hands of the Nogai Tatars, who left it utterly wasted, so that only in the forests and mountains was any trace left of the native Wallachian population. In the latter half of the 13th c., a petty Wallach chief of Transylvania, Radu Negru of Fogarasch, entered
Mole.

Wallachia, took possession of a portion of the country, divided it among his boyars (noble followers), founded a senate of 12 members, and an elective monarchy, and gradually conquered the whole of Wallachia. Rather less than a century later (1554), a similar attempt, also successful, was made by a Wallach chief of the Hungarian Marnavash, of the name of Bogdan, to re-people Moldavia. In the beginning of the 16th c., both principalities placed themselves under the protection of the Porte, and gradually the boyars lost the right of electing their own ruler, whose office was bought in Constantinople. After 1711 the Turks governed the countries by Fanariot princes (see Fanariots), who in reality only farmed the revenues, enriched themselves, and impoverished the land. In 1802 the Russians wrested from Turkey the right of surveillance over the principalities. A great number of nobles—through family marriages with the Fanariots—were now of Greek descent, the court-tongue was Greek, and the religious and political sympathies of the country were the same. Hence the effort of the principalities in 1821 to emancipate themselves from Turkish authority, which was only the prelude to the greater and more successful struggle in Greece itself. In 1822 Russia forced Turkey to choose the princes or hospodars of Wallachia and Moldavia from natives, and not from the corrupt Greeks of Constantinople; and after 1829, to allow them to hold their dignity for life. The principalities, united under one ruler in 1858, were brought under one administration in 1861. For subsequent history, see Romania.

MOLE, Talpa, a genus of quadrupeds of the order insectivora, and family talpidae. All the talpidae live chiefly underground, and their structure is adapted to their mode of life. In their general form, the character of their fur, the shortness of their limbs, the great muscular strength of the fore-parts, and great breadth of the fore-paws, the elongated head, the elongated and flexible snout, the smallness of the eyes, and the complete concealment of the ears, they all resemble the Common Mole (T. Europaea), with which also they pretty nearly agree in the nature of their food, their mode of seeking it, their denticion, and the shortness of their alimentary canal. The common mole is abundant in most parts of Europe, except the utmost n. and the utmost south. In Britain it is very plentiful, except in the n. of Scotland; but is not found in Ireland nor in some of the Scottish islands. Instead of its ordinary uniform black color, it is occasionally found yellow, white, or gray, and even orange. Its silky or velvety fur lies smoothly in every direction, the short hairs growing perpendicularly from the skin; a peculiarity which preserves it clean as the animal moves either backwards or forwards in its subterranean galleries. The fore-paws are not only very broad, but are turned outwards, for the better throwing back of the earth in burrowing. They are terminated by five long and strong claws. The phalangeal bones are remarkable for breadth and an elongated bone of the carpus gives additional strength to the lower edge of the paw. The two bones of the forearm are fastened together. The shoulder-blades and the clavicles are very large; and the sternum has an elevated ridge as in birds and bats, for the attachment of powerful muscles. The muscles which move the head are also very powerful, and the cervical ligament is even strengthened by a peculiar bone; the mole making much use of its head in burrowing. Of the shoulder muscles, under further lines are the very small, with five toes. The eyes are black and very small, capable of being partially retracted and exerted. The senses of hearing, taste, and smell are very strongly developed in the mole. The cutting-teeth are very small and sharp; the canines long and sharp; the true molars broad, with many sharp conical elevations. This dentition adapts the animal for feeding not only on worms and grubs, but also on frogs, birds, and small quadrupeds, which accordingly are its occasional prey, although earthworms are its chief food. The mole is an excessively voracious animal; digestion is rapid, and no long interval can be endured between meals, hunger soon ending in death. When pressed by hunger, it will attack and devour even one of its own kind; and its practice is immediately to tear open the belly of any bird or quadruped which it has killed, and inserting its head, to satiate itself with the blood. In eating earthworms, it skins them with remarkable dexterity. In quest of them, it works its way underground, throwing up the earth in mole-hills; more rarely in the fine nights of summer, it seeks for them on the surface of the ground, when it itself apt to be picked up by an owl equally in want of food. The habitation of the mole is of very remarkable construction; a hillock of earth larger than an ordinary mole-hill, and containing two circular galleries, one above the other, with five connecting passages, and a central chamber which has access to the upper gallery by three passages; whilst about nine passages lead away from the lower gallery in different directions. The end of a passage entering a gallery on one side is never opposite to the end of a passage entering on the other. To afford all facility of escape in case of any alarm, a passage leads at first downwards from the central chamber, and then upwards again till it joins one of the high roads which the mole keeps always open, which are formed by pressing the earth till it becomes smooth and compact, and are not marked by any mole-hills thrown up, and which not only serve for escape when necessary, but lead to those parts of the creature's appropriate domain where the ordinary nursery or rearing for worms is to be prosecuted. The nest in which the female mole produces her young is not this habitation, but is formed generally under a mole-hill rather larger than usual, where two or three runs meet, and is lined with leaves and other warm materials. The mole breeds both in spring and autumn, and generally produces four or five young at a birth. The attachment of the parent moles seems to be strong, but transitory.
It has been sometimes alleged that moles eat vegetable as well as animal food, and that they are injurious to farmers, by devouring carrots and other roots; but it appears rather that they only gnaw roots when in the way of their mining operations, or perhaps, also, in quest of grubs which they contain. Moles are generally regarded as a pest by farmers and gardeners, owing to the injury which mole-hills do to lawns and pastures, the burying up of young plants, and the disturbance of their roots. But they are certainly of use in the economy of nature in preventing the excessive increase of some other creatures; and probably also contribute to the fertility of some pastures, for the continual tillage which they carry on. Mole-traps of various kinds are in use, which are planted, if the mole-catcher is skilful, in the often-traversed roads of the animals. Mole-catching has long been a distinct trade in Britain.

The name mole is abbreviated from the old English name *moundearp*, or *mouldiearp*, still provincially used, and which is derived from the Anglo-Saxon *mole*, mould, and *scorpan* to throw up.

Another species of mole (*T. ecaudata*) is found in the most southern parts of Europe; very similar to the common mole, but rather smaller, and having the eye always covered by the eyelid, so as to justify Aristotle's statement that the mole is blind.—A species, also very similar to the common mole, is found in North America.

Among the other *talpide ae* are the Changeable Mole, or Cape Mole (*chrysochloris capensis*) of South Africa, which is remarkable as the only one of the mammalia that exhibits the splendid metallic reflections so frequently seen in some other classes of animals, the Shrew Mole (q.v.) and the Star Nose (q.v.) of North America.

MOLE. See NAEVUS.

MOlé, Louis Mathieu, Comte, a French statesman, and a descendant of the famous French statesman and magistrate, Mathieu Molé (b. 1584; d. 1653), was b. at Paris, Feb. 12, 1759, and died in 1848. His father, president of the parliament of Paris, died by the guillotine in 1791. His mother was a daughter of Malchesnes. Molé was for the time a sort his own preceptor, and displayed a wonderfully precocious love of hard work and independent reflection. In 1805 he published *Essais de Morale et de Politique*, in which he vindicated the government of Napoleon on the ground of necessity. The attention of the emperor was drawn to him; he was appointed to various offices in succession, and raised to the dignity of a count, and to a place in the cabinet. After Napoleon's return from Elba, he refused to subscribe the declaration of the council of state banishing the Bourbons forever from France, and declined to take his seat in the chamber of peers. In 1815 Louis XVIII. made him a peer, and he voted for the death of Ney. In 1817 he was for a short time minister of marine, but afterwards acted independently of party, and was one of the principal orators in the chamber of peers. In 1839 he became minister of foreign affairs in Louis Philippe's first cabinet, but only for a short time. In 1839 he succeeded Thierry as prime minister; but, in the eyes of the liberal party, he displayed too entire a devotion to the wishes of the king, and thus rendered his ministry very unpopular, so that in 1839 he felt it necessary to resign. In 1840 he was chosen a member of the Académie Française. From that time he took little part in political affairs, but after the revolution of 1848 exerted himself, but in vain, to rally and unite the party of order in the assembly to which he had been elected. He died at Champlâtreux, Nov. 23, 1855. Molé was fiercely attacked and abused in the latter part of his political career, but it is not now believed that he was servile toward the court. He detested anarchy, and believed in the necessity of a strong government; but he loved genuine liberty, and always placed the constitution above the king. When Louis Napoleon's coup d'état extinguished the republic, Molé proudly said that henceforth he could have nothing to do with politics.

MOLE-CRICKET, Gryllotalpa, a genus of insects of the cricket (q.v.) family (acrididae or Gryyllidae), remarkable for burrowing habits, and for the great strength and breadth of the fore-legs. The other legs are also large and strong, but of the form usual in the family.—The best known species (*G. vulgaria*) common in many parts of Europe, and pretty abundant in some places in England, but very local—is almost 2 in. long; of a velvety brown color; the wings, when folded, do not cover much more than one-half of the abdomen, although large when expanded. It uses its fore-legs not only for digging burrows in earth, but for cutting through or tearing off the roots of plants which come in its way; its front feet are fitted with strong claws for digging in the earth and vegetable substances, and often does no small injury to crops. The chirping, and somewhat musical call of the mole-cricket, produced in the same way as that of the common cricket, is heard chiefly in the end of spring and beginning of summer, and only in the evening or at night. In some parts of England this sound has gained it, the name of night-crow. Another local English name is croaker. The female mole-cricket prepares a curious nest, a rounded subterranean cell, about as large as a hen's egg, having a complicated system of winding passages around it, and communicating with it. In this cell she deposits from 100 to 400 eggs. The young live for some time in society. They run actively, both in the larva and pupa states. The mole-cricket is very combative, and the victor generally eats the vanquished.—A species of mole-cricket (*G. didactyla*) does great injury to the plantations of sugar-canes in the West Indies.—A curious Indian insect, of a closely allied genus
Mole.
Molesworth.

{\textit{Schizodactylus mæstruous}}, has prodigiously long wings, which as well as the wing-covers, are rolled into spiral coils at the tips.

MOLECULE, MOLECULAR VOLUMES. See \textit{Atom}; ATOMIC THEORY; CHEMISTRY. ante.

MOLENBEEK, ST. JEAN, a t. in Belgium, in the suburbs of Brussels; pop. 37,292. It has a museum of natural science.

MOLE-RAT, \textit{Spalax} or \textit{Asaphis}, a genus of rodent quadrupeds of the family \textit{muridae}, having teeth almost like those of rats, but in many respects resembling moles, as in general form, shortness of limbs, concealment of ears, smallness or even rudimentary condition of eyes, and burrowing habits—although their food is altogether different, consisting wholly of vegetable substances, and chiefly of roots. One species (\textit{S. typhlus}) inhabits the s. of Russia and some parts of Asia. It is also known as the \textit{Podalictus marimo}, blind rat, sleek, zemu, etc. The mole-rat makes tunnels and throws up hillocks like the mole, but its hillocks are much larger.—Another species, found in the Malay archipelago, is as large as a rabbit.—Nearly allied is the \textit{Coast Rat} or \textit{Sand Mole} of s. Africa (\textit{bathyergus marinuus}), also as large as a rabbit, with other species of the same genus, also natives of s. Africa, which drive tunnels through the sandy soil, and throw up large hillocks.

MOLESCOTT, Jacob, b. Holland, 1822; took a medical degree at Heidelberg, and began the practice of medicine at Utrecht, whence he removed, in 1847, to Heidelberg, where for seven years he lectured on physiology at the university. A real or supposed tendency towards materialism, in his lectures, alarmed the authorities, and he resigned. Soon after he was appointed professor at Zurich, and in 1861 he was called to the chair of physiology at Turin. His physiological researches, particularly in regard to diet, muscular formation, the eloxed and blood aneurysm of value. Without asserting the impossibility of a spiritual life, he explains the origin and the condition of animals by the working of physical causes. His characteris-it formula is: "No thought without phosphorus." His most important works are: \textit{Lehre der Nahrungsmitteln}, 1850, which has been translated into English by Dr. Bonner as \textit{The Chemistry of Food and Diet}; \textit{Physiologie der Nahrungsmitteln}, 1850; \textit{Ursehe und Wirkung in der Lehre vom Leben}, 1857; and \textit{Von der Selbstdenauung im Leben der Menschheit}, 1871.

MOLESKIN AND COR DUBOY are varieties of fustian (q.v.), a term which is used in a generic sense to include also velveteen, velvety, thick set, thick set cord, beaverette, and other stout cotton cloths for men's apparel—a class of goods largely manufactured in Lancashire. The general structure of these fabrics is described under \textit{Fustian} and \textit{Velvet}. They are, in point of fact, all of the nature of velvet, with a nap or pile on the surface, and most of them are twilled.

When cloth of this kind leaves the loom, its surface is covered with loops like Brussels carpet, and these are then cut open with a ripping knife of a peculiar shape, which the operatives learn to use with great dexterity. The hairy and uneven appearance which the cloth has in this state its operation is subsequently improved by the shearing process. The cloth is next steamed in hot water, to get rid of the paste used in dressing the yarn, and is then ready to be passed through the brushing or teaseling machine, which consists of blocks of wood with concave surfaces covered with card brushes, working backwards and forwards in a lateral direction against wooden rollers, encased in tin plate, over which the cloth passes. The tin plate is made rough with the bars of punched holes. In the next operation, the fustian is singed by passing the nap side quickly over a red-hot metal cylinder. The brushing and singeing are repeated three and occasionally four times, to give the cloth a smooth appearance. It is then washed, bleached with chloride of lime, and dyed—usually of some shade of olive, slate, or other quiet color.

The different names given to fustian cloths depend upon their degree of fineness, and the manner in which they are woven and finished. Thus, smooth kinds, of a strong twilled texture, are called \textit{moleskins} when worn before dyeing, and \textit{beaverettes} when cropped after dyeing. Corduroy, or king's cord, is produced by a peculiar disposition of the pile-threads. In all fustians, there is a warp and weft thread, independent of the additional weft-thread forming the pile; but in corduroys, the pile-thread is only "thrown in" where the cored portions are, and is absent in the narrow spaces between them.

Until a comparatively recent period, the quantity of fustian cloths annually consumed in the British islands must have been very large, but the increased price of cotton, and the introduction of cheap wooden fabrics, have now very much curtailed the use of them. They are still, however, largely worn by certain classes of mechanics and laborers.

MOLESTATION, in Scotch law, means disturbing the possession of heritage, and an action of molestation is a remedy for the trespasses.

MOLESWORTH, GUILFORD LINDSAY, b. England, 1828; educated at the college of civil engineers at Putney. In 1852 he became chief assistant engineer of the London, Brighton, and South Coast railroad, but soon resigned to conduct the constructions at Woolwich arsenal during the Crimean war. After practicing his profession in London for a number of years, he went to Ceylon, and in 1862 became chief engineer of the gov-

U. K. X.—7
Molesworth.  

About 1867 he was appointed director of public works; and in 1871 consulting engineer to the Indian government. He has published a *Pocket-book of Engineering Formulae*.

MOLESWORTH, Sir William, Right Honorable (eighth baronet), English statesman, was b. in 1810. Linearly descended from an old Cornish family of large possessions (the first baronet was president of the council in Jamaica in the time of Charles II., and subsequently governor of that island), he early showed promise of distinction. His university career at Cambridge was, however, cut short by his sending (under circumstances of great provocation) a challenge to his tutor to fight a duel. He continued his education at the university of Edinburgh, and subsequently at a German university. After making the usual tour of Europe, he returned home, and threw himself, in 1831, into the movement for parliamentary reform. Next year, although only just of age, he was elected member of parliament for Cornwall (East). He sat for Leeds from 1837 to 1841, and the two subsequent years, and in 1845, while partly recovery four years, he did challenge to a duel which he gave himself a second and sounder political education. He was the intimate friend of Bentham and James Mill, and was regarded as the parliamentary representative of the "philosophical radicals." Having been a great admirer of Hobbes, he accumulated materials for a life of the "Philosopher of Malmesbury," which remains in MS., uncompleted. In 1839 he commenced and carried to completion, at a cost of many thousand pounds, a reprint of the entire miscellaneous and voluminous writings of that eminent author. The publication was a valuable contribution to the republic of letters, and the works of Hobbes were placed by Molesworth's munificence in most of our university and provincial public libraries. The publication, however, did him great disservice in public life, his opponents endeavoring to identify him with the freethinking opinions of Hobbes in religion, as well as with the great philosopher's comprehensive system of despotism. In 1845, he was appointed to the Southwark (which he continued to represent until his death), and entered upon a parliamentary career of the greatest energy and usefulness. He was the first to call attention to the abuses connected with the transportation of criminals, and as chairman of a parliamentary committee brought to light all the horrors of the convict system. He pointed out the maladministration of the colonial office, explained the true principles of colonial self-government, prepared draught constitutions for remote dependencies, and investigated the true and natural relations between the imperial government and its colonial empire. Molesworth's views, although at first unpalatable to the legislature, have been adopted by successive administrations, and are now part and parcel of the colonial policy of Great Britain. In January, 1853, he accepted the office of first commissioner of public works, in the administration of the earl of Aberdeen; and in 1855 the post of secretary of state for the colonies, in that of viscount Palmerston. This appointment gave great satisfaction to our dependencies; but before he could give proof of his administrative capacity, he was (Oct. 22, 1856) struck by the hand of death, while yet in the full vigor of life and intellect. He established the *London Review*, a new quarterly, in 1835; and afterwards purchased the *Westminster Review*, the organ of the "philosophical radicals." The two quarters being then merged into one, under the title of the *London and Westminster*, Molesworth contributed to it many able articles on politics and political economy.  

MOLESWORTH, William Nassau, b. England, 1816; was educated at Cambridge and entered the English church. He was presented to St. Andrews, Manchester, in 1841, and to St. Clement, Spotland, Rochdale. He has been an advocate of co-operation, and has taken part in the well-known experiment of co-operation at Rochdale. His most important writings are *A History of the Reform Bill of 1832* and *History of England from the Year 1830*, 3 vols., 1871-73.

MOLFETTA, a city of southern Italy, in the province of Bari, situated on the Adriatic, 18 m. n.w. of Bari; pop. 72, 36,829. The neighborhood yields excellent fruits, especially almonds and oranges, and has extensive olive plantations. Fish abound along the coast. The city contains a magnificent cathedral, and is partly inclosed by walls; it is conjectured that it occupies the site of some early forgotten town, from the numerous vases, urns, and other relics of antiquity found in its vicinity.  

MOLIÈRE, Jean Baptiste (properly, Jean Baptiste Poquelin)—the name of Molière not having been assumed till he had commenced authorship, was b. at Paris, Jan. 15, 1622. His father, Jean Poquelin, was then an upholsterer, but subsequently became a valet-de-chambre to the king. Regarding the boyhood of Molière almost nothing is known, but his credulous biographers have put together whatever tradidtional gossip they could find floating on the breath of society. Voltaire, while recording these *contes populaires*, as he calls them, pronounces them *très-faux*. All that we really are certain of is that in his 14th year he was sent to the Jesuit college de Clermont in Paris, where he had for a fellow-student prince Armand de Conti, and that, on leaving the college, he attended for some time the lectures of Gassendi. He was charmed, we are told, by the freedom of thought permitted in speculative science, and, in particular, conceived a great admiration for Lucretius, the Roman poet-philosopher, whom he undertook to translate. Of this translation, only a single passage remains, interpolated in the *Misanthrope* (act ii, scene 4). About 1641 he commenced the study of
law, and appears to have even passed as an advocate; but the statement of Tallemant des Réaux that he actually ventured into the precincts of theology, is generally rejected. Molière detested priests. So gay, humorous, and sharp-eyed a humanitariun would have felt quite miserable under the restraints of a monkish life. In 1645 he suddenly appeared upon the stage as member of a company of strolling players, which took the name of the Illustré Théâtre, and performed at first in the faubourg of Paris, and afterwards in the provinces. For the next 12 years we can only catch an occasional glimpse of him. He was playing at Nantes and Bordeaux in 1648, at Narbonne and Toulouse in 1649, at Lyons in 1653 (where his first piece, L'Eléphant, a comedy of intrigue, was brought out), at Lyons and Narbonne again in 1655, at Grenoble during the carnival, and also at Rouen in 1658. During these now obscure peregrinations, he seems, although an industrious actor, to have been also a diligent student. He read Plutus, Terence, Rabelais, and the Italian and Spanish comedies, besides—which, indeed, the rest would have been of little avail—making a constant use of as quick eyes as ever glittered in a Frenchman's head. At Paris, by the powerful recommendation of his old schoolfellow, the prince de Conti, Molière's company got permission to act before the king, who was so highly pleased, that he allowed them to establish themselves in the city under the title of the Troupe de Monsieur. In 1659 Molière brought out Les Precieux Ridicules, the fine satire of which—lasing at times, however, into caricature—was instantly perceived and relished. "Courage, Molière!" cried an old man on its first representation; "c'est la véritable comédie." The old man was a prophet. Veritable comedy dated in France from that night. Ménage, the critic, is reported to have said to Chapelain the poet, as they were going out of the theater: "Henceforth (as St. Remi said to Clovis), we must burn what we have worshiped, and worship what we have burned. In 1660 appeared Sansanative, the first Cœur de L'Enfant, or the Baby's Heart of Life, in which Molière completely passes out of the region of farce into that of pure comic satire—and Les Fâcheurs. In the following year, Molière married Armande-Grisinde Béjart, either the sister or daughter (for it is still undetermined) of Madeleine Béjart, an actress of his troupe, with whom he had formerly lived in what the French politely call "intimate relations." That, however, there is the slightest ground for supposing that the great comedian incestuously married his own daughter, nobody now believes, though the revolving calumni was freely circulat ed even in Molière's lifetime. His literary activity continued as brisk as before. Among several pieces belonging to this year, the most celebrated is L'École des Femmes, which excited, not without reason, the most violent indignation among the clergy and the devout, for there was an excessive indecency in the expression, and the author indulged in a caricature of religious mysteries that could not but be offensive. Molière defended himself with incredible audacity in his L'Impromptu de Versailles. Le Tartuffe, written in 1664, was prohibited from being brought upon the stage; but Molière was invited by his literary friends, Boileau and others, to read it in a semi-public manner, which he did with the greatest approbation. In 1665 Louis XIV. bestowed a pension of 7,000 livres on Molière's company, which now called itself the Troupe du Roi. Next year appeared Le Misanthrope, the most artistic of all his comedies; shortly after followed by Le Médicis Malgré Lui. When Tartuffe was at last brought upon the stage in 1669, it obtained a superb success. The truth, the variety, the contrast of the characters, the exquisite art shown in the management of the incidents, the abundance of the sentiments, and the wonderful artifices of feeling—laughter, anger, indignation, tenderness—make this, in the opinion of most critics, Molière's masterpiece. To the same year belongs L'Aveu. In 1670 appeared Le Bourgeois Gentilhomme, a very pleasant satire on a very prevalent vice among wealthy tradesmen—viz., the vulgar ambition to pass for great gentlemen. Then came Les Fourberies de Scapin (1671), followed by Les Femmes Savantes (1672), full of admirable passages; and Le Malade Imaginaire (1673), the most popular if not the best of all Molière's comedies. While acting in this piece, he was seized with severe pains, which, however, he managed to conceal from the audience; but on being carried home, hemorrhage ensued, and he expired at ten o'clock at night (Feb. 17, 1673). As Molière had died in a state of excommunication, and without having received the last acts of religion—which, however, he had implored—the archbishop of Paris refused to let him be buried in consecrated ground; but the king interfered—a compromise was effected, and he was privately interred in the cemetery of St. Joseph, being followed to the tomb by a hundred of his friends with lighted torches. In 1792 his remains were transferred to the museum of French monuments, from which they were removed to Père Lachaise in 1817. Molière ranks as the greatest French comic dramatist—perhaps the greatest of all comic dramatists. Among the best editions of Molière's works are those of Auger (1819-25), Aimé-Martin (1833-36), Moland (1851), and Despois (1874 et seq.). A complete English translation of Molière's works is that by Van Laun, in 6 vols. (Edin. 1875-76). The best biographies are by Taschereau (1825-27), and Bazin (1851). The books devoted to Molière and his works would themselves form a large library.

MOLINA, Fray Alonso de, 1496-1584; b. Spain; entered the order of St. Francis. He went to Mexico to convert the natives soon after the Spanish conquest, and familiarized himself with the Aztec language. He made translations into Aztec of the catechism and of a confessional manual. He also wrote a grammar of that language, but his great work is his Aztec-Spanish Dictionary, completed in 1571.
Molina, Louis, a celebrated Spanish Jesuit theologian, was b. at Cuenca, in New Castile, in the year 1535; and having entered the Jesuit society in his 18th year, studied at Combara, and was appointed professor of theology at Evora, where he continued to teach for 20 years. He died at Madrid in 1600 in the 65th year of his age. Molina's celebrity is mainly confined to the theological schools. His principal writings are a commentary on the Summa of St. Thomas (Cuenca, 2 vols. 1593; a minute and comprehensive treatise On Justice and Right (Cuenca, 6 vols. 1592; reprinted at Mainz in 1650); and the celebrated treatise on The Reconciliation of Grace and Free-Will, which was printed at Lisbon in 1588, with an appendix, printed in the following year. Although it is to the last-named work that Molina's celebrity is mainly due, we must be content with a very brief notice of it. The problem which it is meant to resolve is almost as old as the origin of human thought itself, and has always led, in the 4th c., to the well-known Pelagian controversy (q.v.). In reasoning with the freedom of man's will the predetermination of the elect to happiness, and of the reprobate to punishment, Molina asserts that the predestination is consequent on God's foreknowledge of the free determination of man's will, and, therefore, that it in no way affects the freedom of the particular actions, in requital of which man is predestined, whether to punishment or to reward. God, in Molina's view, gives to all men sufficient grace whereby to live virtuously, and merit happiness. Certain individuals freely cooperate with this grace; certain others resist it. God foresees both courses, and this foreknowledge is the foundation of one or of the other decree. This exposition was at once assailed in the schools on two grounds—first as a revival of the Pelagian heresy, inasmuch as it appears to place the efficacy of grace in the consent of man's will, and thus to recognize a natural power in man to elicit supernatural acts; second, as setting aside altogether what the Scriptures represent as the special election of the predestined, by making each individual, according as he freely receives or resists the grace offered to all in common, the arbiter of his own predestination or reprobation. Hence arose the celebrated dispute between the Molinists and the Thomists. It was first brought under the cognizance of the inquisitor-general of Spain, by whom it was referred to pope Clement VIII. This pontiff, in 1597, appointed the celebrated congregation, De Averreda, to consider the entire question; but notwithstanding many lengthened discussions, no decision was arrived at during the life-time of Clement; and although the congregation was continued under Paul V., the only result was a decree in 1607 permitting both opinions to be taught by their respective advocates, and prohibiting each party from accusing the adversaries of heresy. The dispute, in some of its leading features, was revived in the Jansenist controversy (see JANSENISM), but with this striking difference, that whereas the rigorous Jansenists denied the freedom of the will when acted on by efficacious grace, all the disputants in the scholastic controversy—even the Thomists—maintain that, in all circumstances, the will remains free, although they may fail to explain how this freedom is secured under the action of efficacious grace.

See AQUINAS.

MOLINE, a t. in Rock Island co., III., on the e. bank of the Mississippi and on the line of the Western Union, Chicago, Rock Island and Pacific, and the Rockford, Rock Island and St. Louis railroads; pop. of township about 6,000. Fine water-power is obtained by a dam reaching from the shore to an island in the river, and from 20 to 25 factories are constantly in operation manufacturing steam-engines, pumps, plows, paper, and many other articles. The place has 3 banks, a weekly paper, a public library, many churches, and a very fine public school.

MOLINELLA, a t. in the province of Bologna, in n. Italy, between the Reno and Po rivers. Pop. 10,751. The chief industry is the manufacture of cheese and hemp. The town was incidently situated on separate islands formed by changes in the course of the Po; these islands have been joined and built over.

MOLINISM, the name given to the system of grace and election taught by Louis Molina (q.v.). This system has been commonly taught in the Jesuit schools; but a modification of it was introduced by the celebrated Spanish divinity Suarez (q.v.), in order to save the doctrine of special election. Suarez held, that although God gives to all grace absolutely sufficient for their salvation, yet he gives to the elect a grace which is not alone in itself sufficient, but which is so tempered to their disposition, their opportunities, and other circumstances, that they infallibly, although yet quite freely, yield to its influence. This modification of Molina's system is called Coexistism. Molinism must not be confounded either with Pelagianism or semi-Pelagianism, inasmuch as Molinism distinctly supposes the inability of man to do any supernatural act without grace (q.v.).

MOLINO DEL REY. An outpost of Chapultepec, about 25 m. from the city of Mexico, where occurred a battle Sept. 8, 1847, between the American troops under Gen. William Scott and the Mexicans commanded by Gen. Santa Anna. Scott's force numbered about 10,000 men; the Mexicans about 7,000 picked men, with a reserve of 12,000. Scott had captured Contreras and Churubusco, and sat down under the walls of Chapultepec from Aug. 26 to Sept. 7, while an armistice existed to enable Nicholas P. Trist, peace commissioner, to conclude an amicable arrangement if possible. At the close of the armistice, the peace negotiations having proved ineffectual, Scott attacked Molino del Rey, which comprised a number of massive stone buildings, about 500 yards in extent, commanded by the defenses of the great fortified castle of Chapultepec, where were
14,000 Mexicans. This position had been originally a flour-mill (mollino), and was afterwards a foundry for the manufacture of arms, and now a fortress defended by Mexican veterans. It was attacked by Scott on the morning of Sept. 8, and, though the battle was a hard fought one on both sides, it was carried by storm on the same day, thus opening the way to the capture of Chapultepec and the city of Mexico.

MOLINOS, Michael de, was b. of noble parentage at Pat cata, in the kingdom of Aragon, Dec. 21, 1627. He received holy orders and was educated at Pamplona, and afterwards at Cisalba, at which university he obtained his theological degree. After a career of considerable distinction in his native country, Molinos went to Rome, where he soon acquired a high reputation as a director of conscience and a master of the spiritual life. His private character was in keeping with this public reputation. He steadily declined all ecclesiastical preferment, and confined himself entirely to his duties in the confessional, and in the direction of souls. An ascetical treatise which he published, under the title of The Spiritual Guide, added largely to the popularity which he had acquired in his personal relations; but there were not wanting many who, in the specious, but visionary principles of this work, discovered the seeds of a dangerous and seductive error. Among these, the celebrated preacher, F. Segnerl, was the first who ventured publicly to call them into question; but his strictures were, by the friends of Molinos, ascribed to jealousy of the influence which Molinos had acquired with the people. By degrees, however, reports unfavorable to the practical results of this teaching and even to the moral and religious character of Molinos and his followers, began to find circulation; and eventually, in the year 1685, he was cited before the holy office, and submitted to closed imprisonment and examination. In addition to the opinions contained in his book, a prodigious mass of papers and letters, to the number, it is said, of 20,000, found in his house, were produced against him, and he was himself rigorously examined as to his opinions. The result of the trial was a solemn condemnation of 68 propositions, partly extracted from his Spiritual Guide, partly, it would appear, drawn from his papers or his personal professions. These doctrines Molinos was required publicly to abjure, and he was himself sentenced to close imprisonment, in which he was detained until his death in 1696, when he had entered on his 70th year.

The opinions imputed to Molinos may be described as an exaggeration of the worst and most objectionable principles of quietism (q.v.). According to the propositions which were condemned by the inquisition, Molinos pushed to such an extreme the contemplative repose which is the common characteristic of quietism, as to teach the utter indifference of the soul, in a state of perfect contemplation, to all external things, and its entire independence of the outer world, even of the actions of the very body which it animates; insomuch that this internal perfection is compatible with the worst external excesses. These consequences are by no means openly avowed in the Spiritual Guide, but they appear to follow almost necessarily from some of its maxims, and they are said to have been plainly contained in the papers of Molinos, which were produced at his trial, and to have been admitted by himself. After the death of Molinos, no further trace of his teaching appears in Italy, but it was revived in more than one form in France.

MOLLAH, among the Turks, is the title of a superior judge. The mollahs are divided into two classes: the first of these, four in number, from whom the mollahs at the court of the pashas are elected, possesses jurisdiction over the more important pashaliks (Adrianople, Brusa, Damasc-is, Cairo); and the second, who only hold their office for the space of a lunar month at a time, and the lowest rank of whom is formed by the mibs, over the inferior provinces, towns, and villages. The mollah is an exponent of civil and criminal law, and of the religion of the state; he is therefore necessarily both a lawyer and an ecclesiastic. Under him is the cadi or judge, who administers the law, and superior to him are the kadihasker and the muffit (q.v.). They all are, however, subject to the shiekh al islam or supreme mufith. In Persia, the office of mollah is similar to what it is in Turkey; but his superior is there the "sadr," or chief of the mollahs. In the states of Turkistan, the mollahs have the whole government in their hands.

MOLLASE, an extensive miocene or middle tertiary deposit, occupying the central lake-region of Switzerland between the Alps and the Jura. It consists chiefly of a loose sand, but at the foot of the Alps it usually takes the form of a conglomerate called "Nagel-flue," which is said to attain the astonishing thickness of from 6,000 to 8,000 ft. in the Righi, near Lucerne, and in the Speer, near Wesen. The mollasse contains a few shells and some vegetable remains, among which are several palms.

MOLLER, George, 1784-1852: b. Hanover; studied architecture in Carlsruhe and Italy. After his return from Italy he was appointed government architect to the grand duchy of Darmstadt. He designed the ducal palace at Wiesbaden, and a number of the public buildings as well as private residences at Darmstadt. He discovered the original design of the Cologne cathedral, the two towers of which have been finished in accordance with his published fac-simile of that design. His most important publications are: Monuments of German Art and Movements of German Architecture.

MOLLITIES OSSUUM, or Osteomalacia, a destructive disease of the bones, characterized by softening and fragility. It has been carefully studied by Curyling, Solly.
Mollusca.

Stanley, Macintyre, and Litzmann, and also by Paget and Dalrymple. The bones become bent, their extremities swollen, and their shafts broken in various parts of the body. No callus follows the fracture as in healthy bone, and in consequence the body of the patient becomes much distorted. On examining the bones after death, they are found light, soft, and gritty to the feel; exceedingly brittle, and of a reddish brown color. CAVITIES of various sizes, and of a round or oval shape, are also found, usually filled with an oily, reddish, grumous fluid, but sometimes with clear serum. The red grumous matter exhibits a cell development, and Solly regards it as a subsequent morbid product, and not simply altered fatty matter colored with blood. Dalrymple found candidate corpuscles in it, and regards it as malignant, in which opinion others agree. Virechow, however, considers the peculiar cellular condition results from retrograde conversion of osteous into medullary substance. Paget regards molluscs ossum as including two diseases—one more common in England, attended with fatty degeneration, and another called osteoporosis by the Germans, in which there is simply removal of earthy matter, and more common in Germany and France. He also believes the Eng- lish affection generally attacks the bones of the extremities, while that form more often seen on the continent attacks the bones of the trunk. The cause of molluscs ossum is rather obscure, but is frequently connected with rheumatic symptoms. In some cases a connection has been traced to syphilis. The physiological conditions which accompany it are those of mal nutrition generally, abnormal digestion, assimilation, and disassimila- tion. It is a disease of adults, rarely attacking persons under 20 years of age, and the aged are also not exempt. Its subjects are more often females than males, and, in a majority of cases, it is connected with the child-bearing state. Of 131 cases collected by Litzmann of Kiel, there were 97 females in whom the disease occurred during preg- nancy, or was discovered immediately after it. Of the remaining 34, 16 were females and 18 males. According to the same authority, the seat of the disease varies as it occurs within the child-bearing period or not. In the 55 child-bearing women the whole skeleton was affected in 6 cases only, and all the bones except those of the head in two; whilst in the 46 other cases not connected with the child-bearing period, all parts of the skeleton were diseased in 21, and all the bones except those of the head in 6. The urine always contains large quantities of earthy matter, chiefly phosphate of lime, which has been absorbed from the bony tissue and excreted in the kidneys. The pelvis, or chamber of the kidney, is sometimes filled with phosphatic accretions, forming a solid calculus. At the commencement of the disease the diagnosis is very difficult, as the symptoms simulate those of rheumatism. It is important, however, to make the dis- tinction as soon as possible, which may be done as soon as the phosphatic condition of the urine is manifested. It is readily distinguished from rickets, as the latter is peculiarly a disease of childhood, and has no tendency to spontaneous fracture of the bones. The treatment offers little encouragement, although judiciously selected tonics will sometimes afford temporary relief, and arrest for a short time the progress of the disease; but its tendency is progressive. In the latter stages opiates are indicated to relieve pain and produce sleep, and, with wine or other stimulants, are the only medicines required.

Mollusca, one of the great animal sub-kingdoms, including so wide a range of dis- tinct forms that it is difficult to frame a definition that shall be applicable to all of them. The lowest forms, termed polyzoa (q.v.) or bryozoza, present so strong a resemblance to zoophytes, that until recently they were as stated with the latter; whilst, on the other hand, in some of the most highly organized of this sub-kingdom, the cephalopoda, there is a decided approximation towards the vertebrated series, as is shown by the presence of a rudimentary cartilaginous skeleton, and a peculiarity in the development of the embryo. The bilateral symmetry of external form which is almost universal in articu- lated and vertebrated animals, is here seldom met with; and taking them as a whole, the mollusca are characterized by the absence rather than by the presence of any definite form. The bodies of these animals are always of a soft consistence—a property to which they owe their name, which was devised for them by Cuvier, before whose time they were included in the Termes of Linnaeus's arrangement. The shell, when it exists, is not to be regarded as an exo-skeleton giving attachment to muscles, and regulating the form of the animal, but merely as an appendage designed for the protection of the body from which it derives its shape; indeed, it is only where the body is uncovered by a shell, or where the locomotive organs can be projected beyond it, that any active move- ments can be effected. The whole fabric is inclosed in a thick, soft, flexible skin, called the mantle, and is on the surface of this envelope that the shell is formed by the devel- opment and subsequent calcification of epithelial cells. In many of the mollusca the shell is composed of a single piece, which is usually a spiral tube, closed at one end, and gradually increasing in size towards the open extremity, from which the animal is able to protrude itself. Shells of this description are called univalves. In others, the shell is composed of two pieces or valves, attached to each other at one point by a hinge, which is furnished with an elastic ligament that serves to open the valves, when it is not opposed by the action of the adductor muscles, whose office it is to keep the shell closed. Shells of this kind are termed bivalves. These differences in the character of the shell correspond with differences in the conformation of the animals inhabiting them. The
bivalve mollusca exhibit no traces of a head, and hence are termed acephalous mollusca, while the univalves have a distinct head, provided with organs of the special senses, and hence, by way of distinction, some writers have termed them cephalophora (or head-bearing). Many mollusca are altogether unprovided with a shell, or have only a small calcareous plate embedded within the mantle. These are termed naked mollusca. It is worthy of notice that the small univalve still in the egg, is almost always furnished with a delicate pellicular shell, even when it is ultimately to be naked, in which case the embryonic shell is cast off soon after the animal makes its escape from the egg.

For the mode of formation, etc., of the shell, see Small.

The movements of many of the mollusca are executed by means of a muscular structure concentrated in some particular part or parts of the mantle, and termed the foot. In some (the gastropoda), the foot forms a sort of flattened disk, by the alternate contraction and expansion of different parts by which the animal can slowly crawl forwards; whilst in others (the free-moving bivalves) it is a tongue-like organ, which can be protruded between the valves, and by its sudden extension, after being previously bent upon itself, can enable its possessor (the common cockle, for example) to take considerable leaps. The foot is also the agent by means of which certain species burrow in the sand or mud, and others bore into the solid rock. Many mollusca, however, are firmly attached to a single spot, except during their larval state; and as they do not require a foot, we find it either altogether undeveloped (as in the oyster), or serving to support a glandular organ, from which filaments of silky or horny matter (called the byssus) are secreted, which serve to attach the animal (the common mussel, for example) to rocks, stones, etc., beneath the water. Many of the subdivisions of the mollusca present modes of locomotion altogether independent of a foot, as, for example, the bythora, which are described in the article Tunicata; those bivalves which possess a branchial or respiratory chamber, into which water is drawn, and again expelled by muscular action, a recoil being thus produced which serves to drive the animal through the water; the pteropoda (q.v.), which are furnished with a pair of broad flattened fins (which may possibly be regarded as a modified foot) at the sides of the head, by means of which they swim with tolerable rapidity; and the cephalopoda, in which the mouth is surrounded by a number of arms, which serve not only as organs of motion, but for the capture of prey.

The nervous system in the mollusca is developed in accordance with two distinct types. In the lowest group of this sub-kingdom (the molluscoids), there is only a single ganglion with afferent and efferent fibers radiating in every direction; while in the higher groups there are several ganglia lying somewhat irregularly in different parts of the body, and communicating by nervous threads with a larger mass placed in the head, or in the neighborhood of the esophagus. This mass consists of several ganglia, which from their position are termed supraesophageal, and is united by filaments with other ganglia lying below the esophagus, so as to form a ring or collar around that organ. The supraesophageal ganglia furnish the nerves to the special organs of the senses. Most of the mollusca possess special organs of touch in the form of lips or of special lobes around the mouth; of tentacles or arms upon the head, or of cirri upon other parts of the body, which in addition to the special organs, the mollusca appear to possess considerable sensibility. When tentacles are present, they are either two or four in number; and they can be protruded and retracted at pleasure, as every one must have noticed in the case of these organs (popularly known as horns) in the snail. Organs of sight are not universally present. In many mollusca there is only one rudimentary eye, while in others there is a large number of imperfect eyes (termed ocelli), which do not of necessity lie in the region of the head. In the higher mollusca there are two eyes, sometimes placed directly on the head, and sometimes on the tentacles; and in the highest group (the cephalopods) the eyes are as fully developed as in fish.

Organs of hearing, in a simple form, are almost always present. They usually consist of round vesicles in the neighborhood of the esophageal ring, from which they receive a nervous filament. They contain a clear fluid and a small concretion of carbonate of lime, which is sometimes roundish, and sometimes of a crystalline form, and are in a perpetual state of vibration, in consequence of ciliary action in the interior of the vesicle. Whether there are any special organs of smell and taste in the mollusca is still undecided.

The organs of vegetative life (of digestion, circulation, etc.) are much more fully developed in the mollusca than those of animal life. The alimentary canal, which presents almost every variety of form from a simple cavity to a complicated intestine, is always provided with two distinct openings, a mouth and an anus, the latter being often situated (as in the gastropoda and pteropoda) on the right side of the anterior part of the body. The liver is always present, existing in a mere rudimentary form in the polyzoa, constituting a large part of the body in the acephalous bivalve mollusca (as the mussel and cockle), and a still larger part in the gastropoda (as the snail), while in the cephalopoda it is constructed upon nearly the same plan as in fishes. Other secreting organs, such as salivary glands, pancreas, and urinary organs, are also present in the more highly developed mollusca.

The circulation of the blood is effected (except in the polyzoa) by means of a distinct heart, which usually communicates with a regular, closed vascular system; but in some cases the venous system is imperfect, and the blood which has been transmitted by the
arteries to the system in general is not confined within distinct vessels, but meanders through sinuses or passages excavated in the tissues, and through them it reaches the respiratory apparatus, whence it is transmitted by closed vessels (veins) to the heart. The blood is nearly colorless (sometimes of light blue or green tint), and contains but few floating corpuscles. In all but the very lowest mollusca there is a distinct respiratory apparatus, which, excepting in the case of the terrestrial gastropoda (as, for example, the snail), is constructed with a view to aquatic respiration, and is composed of branchiolar or gills. These branchiae usually consist of a series of membranous plates (arranged like the leaves of a book or the teeth of a comb), over which the water flows. They are sometimes attached to the surface of the body, but are most commonly inclosed within the mantle, or placed in a cavity in its interior called the branchial or respiratory chamber. In many of the bivalves, the openings for the ingress and egress of water are prolonged into tubes or siphons, which are sometimes of considerable length; the tube through which the water enters being termed the *oral* siphon, while through which it escapes is termed the *anal* siphon. In all the aquatic mollusca except the cephalopoda, the renewal of the water in contact with the surface of the gills is mainly due to ciliary action. In the air-breathing gastropodans mollusca (of which the snails and slugs are well-known examples), there is a pulmonary sac or bag into which the air penetrates by an opening on the right side of the body near the neck.

There are considerable differences in the modes of propagation of the mollusca. In the molluscoidea—i.e. the polyzoa and tunicata—there is both propagation by gemmation (like that of zoophytes, q.v.) and sexual reproduction, the sexes being distinct in the polyzoa, and united in the same individual (constituting hermaphroditism, q.v.) in the tunicata. In the lamellibranchiata, or bivalve mollusca, and in the cephalopoda, the sexes are separate; while in the gastropodans the sexes are most commonly separate, although a considerable number are hermaphrodites, which, however, require mutual impregnation to fertilize the ova. The eggs vary greatly in form; in some cases they are laid separately, but most commonly they are aggregated together in a mass, while in some marine species many eggs are enclosed in a leathery capsule, while numerous capsules are united to form a large mass. A comparatively few mollusca produce living offspring, the ova being retained in the ovicord until the extrusion of the young animal.

The molluscs are widely diffused through time and space. They were amongst the earliest animal inhabitants of our globe, and are everywhere found in fresh and salt water (except at great depths), and in every latitude of the earth. The great majority are marine animals, and it is in the tropical regions that the largest and most beautiful forms are developed. It is impossible to form even an approximate estimate of the number of mollusca. According to Levasseur (Synopsis der drei Naturwissenschaften; erste Theil, 1860, p. 77), there are 16,732 living, and 4,590 fossil species, exclusive of polyzoa; and it is probable that only a small proportion of the naked or shell-less mollusca is yet known.

The uses of many species of mollusca for food are too well known to require notice, and as bait for fishing, mussels and some other molluscs are of great value. The animals of this subkingdom are divisible into the molluscoidea and the true mol-luscans, the former being distinguished from the latter by the very low development of the branchial system, which is composed of only a single gauhanum, giving off nerves in different directions, and by their propagating by gemmation. The molluscoidea are divisible into: Class 1. Polyzoa or Bryozoa. Examples—*Phumadella*, *Plumatella*. Class 2. Tunicata. Examples—*Ascidia*, *Salpa*. The true mollusca are divisible into: Class 3. Brachiopoda or Paliolibranchiata. Examples—*Terebratula*. Class 4. Lamel-ibranchiata. Examples—*Oyster*, *Mussel*, *Cockle*. Class 5. Gastropoda. Examples—*Snail*, *Cray*, *Limpet*, *Doris*. Class 6. Pteropoda. Examples—*Clio*, *Hydrea*. Class 7. Cephalopoda. Examples—*Cuttle-fish*, *Nautilus*. The distinctive characters of these classes are given in separate articles.

The literature of this subject is very extensive. Amongst the most important works on the mollusca generally may be mentioned Cuvier, Mémoire pour servir à l'Histoire et à l'Académie des Sciences avec 35 pl. (Paris, 1817, 4to); Lamarck, Hist. Nat. des Animaux sans Verre, 4 pl. ed.; Deshayes and Milne-Edwards (11 vols. 8vo); Woodward, Manual of the Mollusca; and the third volume of Bronn's great work, published at Leipsic in 1861, entitled Classen und Ordnungen des Tierreiches; while for information on the mollusca of Great Britain, the reader is especially referred to Forbes and Hanby, Molluscan Animals and their Shells (4 vols. 8vo); Gosse, A Manual of Marine Zoology for the British Isles; and Alder and Hancock, Mollusca (published by the Ray society).

**Fossil Mollusca.**—The hard shells of most Mollusca fit them for long preservation, and make them the most frequent organic remains in the fossiliferous rocks from the Silurian upwards. The tunicata and the nudibranchiate gastropodans, having no hard parts that could be preserved, are without fossil representatives; the glassy and translucent fragile shell of the pteropoda is only known fossil from a few species in the tertiary strata; unless, indeed, the comparatively large forms (commensusor and theta) from the older rocks have been rightly referred to this order. The remaining four orders—the cephalopodans, gastropodans, brachiopodans, and lamellibranchiata—have existed together from the earliest
period. The tetrabranchiate cephalopoda were developed in great profusion and variety in the paleozoic and secondary periods; and as they decreased, the dibranchiate group took their place, and continued to increase in numbers until it reached its greatest development in the seas of our own day. Of the chambered shells like the pearly nautiliis, it is estimated that over 1,400 species are known, of which only five or six exist in the ocean now; the cuttle-fishes and squids, on the other hand, are represented in the secondary and Tertiary rocks by about 100 species, while at least twice as many are known as living species.

The living gasteropoda exceed the fossil in the proportion of 4 to 3. This dis-proportion will appear greater when we remember that the fauna of the present seas is set against the faunas of some thirty different periods, yet it must not be forgotten that we can never be acquainted with more than a fraction of the entire animal life of any bypast age. Almost contemporaneous with the first living organisms, this group has gone on increasing to the present time, when the numbers are so great that more than 8,000 living species have been recorded. A genus of air-breathing univalves has been described by Lyell, from the coal-measures of Nova Scotia. A single species—a modern-looking phyas,—has been obtained from the Purbeck limestone, the newest of the secondary rocks. They are more frequent in tertiary beds.

The brachiopoda, or lamp-shells, like the nautiliis group, have their history chiefly written in the rocky tablets of the earth. Of 1,300 known species, only 75 are living, and these are comparatively rare, or are at least found in inaccessible localities, whereas, in some periods of the earth's history, as when the chalk and mountain limestone beds were being formed, and especially during the Devonian period, the individuals abounded to an enormous extent. The genus lingula, seven species of which live in the modern seas, can be traced through the intervening strata, down to the first fossiliferous bed, to which, indeed, it gives the name of "lingula bed;" but this species, though externally not to be distinguished from the existing shell, has a pedicle groove in the ventral valve—a character sufficient, perhaps, for the establishment of a different genus. Indeed, none of the genera of the paleozoic rocks still exist; the want of exact information is the only excuse for the continued application of the names of recent genera to the ancient inhabitants of the globe.

The conchifera have been gradually increasing in numbers and importance from the earliest period, and they attain their maximum development in the existing seas. The more simple forms, with an open mantle, are common in the paleozoic strata; the siphalonated families, unknown in the older rocks, appear in considerable number in the secondary strata, and continue to increase upwards. The recent species number about 3,000, while the fossil are nearly twice as many.

MOLLUSCOIDA, a division of the sub-kingdom Mollusca (q. v.), also in the article INVERTEBRATE ANIMALS.

MOLL WITZ, a village of Prussian Silesia, in the government of Breslau, seven m. w. of Breslau. Pop. 619. To the e. of it lies the celebrated battle-field where Frederick II. of Prussia gained his first victory over the Austrians under marshal Neipperg April 10, 1741. According to the usual account, Frederick, on seeing his right wing and center thrown into confusion and routed, put spurs to his charger, and fled from the field; but the advance of three battalions of Prussian infantry stopped the Austrians, while by this time marshal Schwarin, who commanded on the Prussian left, routed the Austrian right wing, and compelled the whole to retreat. The Austrians suffered immense loss in killed, wounded, and prisoners. The immediate result of this victory was an alliance between France and Prussia, to dissolve which Austria was compelled to surrender the province of Silesia to Frederick, in 1742.

MOLLY MAGUIRES, a secret order which existed in 1851-57, and probably still exists, in the anthracite coal mining region of north-eastern Pennsylvania. Here 400 collieries employed 69,000 men; Americans, Germans, Welshmen, Englishmen, and Swedes comprising one-half the number, the remainder being Irish. Among the latter half originated, in the locality named, the order of Molly Maguires, a branch of the "ribbonsmen" of Ireland. The order, however, had a much wider existence, and is alleged to have been affiliated with the "ancient order of Hibernians," elsewhere a peaceable and reputable organization. Until 1865 and '66 the order of Molly Maguires had not become generally known for the murders and other outrages which then distinguished it. In 1875, having gained control of a combination which forced a general strike in the coal-regions, it succeeded in obtaining an ascendency in the councils of the miners, and from that period was prominent in assassinations and other outrages, committed usually on the persons and against the property of justices of the peace, police officers, and mining bosses. The number of murders increased between 1869 and '71, and fell off after the latter year, and until that of the great strike of 1875. According to some of those who made an investigation into the antecedents of the Molly Maguires, they originated in the trade-unions, and not in the A. O. H. or among the ribbonmen. None, of Catholic Irishmen or their descendants were admitted to membership; the order was organized in divisions, each having a chief official known as a "body-master," and there were signs and passwords to enable members to distinguish each other. These signs and passwords were given to the members by the body-masters, who received
them from the county delegate, who got them from the state delegate, to whom they were furnished by the national delegate or national board in New York city: to the latter they came quarterly from Ireland, by the hands of the steward of one of the transatlantic steamships. *A central and governing organization known as "The Board of Erin," was said to be the origin of the order, and this board quarterly met in England, Scotland, or Ireland. So extended were the ramifications of this order in Pennsylvania, that it was made known during the trials of the Molly Maguires in 1877, that one of their body-masters in the Pottsville district held the high office of county commissioner. The final exposure, capture, and punishment of the Molly Maguires was largely due to the energy and determination of Franklin B. Gowen, president of the Philadelphia and Reading railroad co. and coal co.; through the immediate instrumentality of James McFarlan, a detective, who joined the Molly Maguires, became acquainted with their members and the secrets of their organization, and was at length enabled to afford information which disclosed the names of criminals connected with a majority of the murderers committed by the order. A large number were apprehended, tried, and condemned, and their execution—that of a number of them occurring on the same day—so alarmed the members of the order that it ceased to possess any extended influence.

**MOLO**, a city of the Philippine islands, on an island of the same name, 4 m. from Hilo. See **PHILIPPINES**. In ancient times, it was a Chinese colony, and is now occupied by Messizos and their descendants, most of them having a mixture of Chinese blood. Pop. 16,000.

**MOLOC** (more correctly **Molech**), also **Milkom**, **Malkom** (**their** king), from Heb. **Melech**, king, the chief Ammonite deity (the Chemosh of the Moabites), whose worship consisted chiefly of human sacrifices, purifications, and ordains by fire, mutilation, perpetual virginity, and the like; practices specially inveighed against in the Mosaic records. Every stranger who should devote his offspring to this idol was to be put to death by stoning. It is not quite certain which was the particular manner of this sacrifice. Rubbinical tradition represents Molech as a human figure of brass or clay, with a crowned bull's head, upon whose extended arms were laid the doomed children. A fire within the hollow statue soon scorched them to death, while their shrieks of agony were deafened by a loud noise made by the priests upon various instruments. But although this description nearly coincides with that of the statue of the Carthaginian Kronos, and although so late a traveler even as Benjamin de Tudela speaks of having seen the remains of an ancient Ammonite temple at Gebal, with the fragments of an idol somewhat corresponding to the above representation, yet nothing certain is known about this point at present: nay, even the burning of the children itself has been questioned; and it is contended, yet without much show of reason, that the victims were merely carried through two pyres of fire by way of solemn purification or baptism. It seems, however, certain that the worship of Molech, in whatever shape it may have been, was common throughout the Canaanite nations. The Carthaginians, through whom it was probably spread over the whole east, worshipped Kronos in rites of fire and bloodshed; and human beings, children or grown-up persons, prisoners or virgins, were, either on certain periodical festivals, or on sudden emergencies, offered up throughout almost all the lands and islands which the merchant-people of antiquity may be supposed to have touched at.

The description of the Kronian statue, as given by classical writers, differs only in that small respect from the one given above, that the child fell, according to the former, from the hands of the god into a burning fire below, instead of being slowly burned to death. On fire worship in general, which is the main idea of "Molech"—probably worshiped originally as the symbol of the sun—we have spoken under **GEBELES**. The name itself gives no clue to its special nature, nor does any comparison with cognate roots lead any further. Molech, or Melech, is the supreme king or deity of the people, who have enshrined him as their tutelary god. Naturally, the princes of Ammon are the princes of Melech = their (**the Ammonites**) king or god, and his priests were high in social rank.

Respecting the special history of this worship among the Israelites, we can only say that, although we do not see any more reason to suppose its wide spread at early times (on account of the frequent occurrence of the word "king" in doubtfull passages) than there is the slightest ground for assuming (as has been done by Fazmer and others) that the whole Mosaic religion originated in a Molech-service (a notion which hardly required a serious refutation for its instant explosion), yet there is no doubt that it had its secret, although few adherents, even before the Canaanite women in Solomon's harem reintroduced it publicly. The Valley of Hinnom and the Mount of Olives were the chief places of these abominable rites; the former being afterwards adopted as the name for hell, even in Islam. Not until the time of Joshua was the Molech, not the priest, the people's priest become a designation for a kind of irresistible dread influence, at whose shrine everything would be sacrificed, even as the deduced father offered his own child to the terrible idol.

**MOLOCH**, a genus of saurian reptiles, of the family **Agamidae** (see **AGAMA**). **M. horridus**, an Australian species, is perhaps the most ugly and repulsive in appearance of all the saurian tribes. The whole surface of the body is covered with irregular plates and strong sharp spines; the upper surface of the head is crowned with two very large spines;
and on the back of the neck are large rounded protuberances, covered with granular scales and spines. The moloch is, however, a perfectly inoffensive creature.

**MOLOGA**, a district t. in the w. of the government of Jaroslav. in European Russia, is situated near the confluence of the Mologa and Volga, 68 m. w.n.w. of Jaroslav. It is a town of great antiquity, and first belonged to the principality of Rostof, afterwards to Jaroslav, but from 1321 till 1471 it had its own princes. There was formerly an extensive fair at Mologa. The timber-trade, and the carriage of goods by river-boats and rafts, now occupy the majority of the inhabitants. Pop. 67, 3,715.—The river Mologa is one of the links between the Volga and the Neva.

**MOLOSSIA, or Molossis, a division of ancient Epirus, comprising the n.e. district, its chief town was Ambracia. The country was famous, in ancient times, for its breed of shepherd dogs.**

**MOLOSSUS, a genus of bats (chiroptera).** The head and ears are large; hind limbs robust, giving the animal more power of running than most others of the order; tail long, enveloped at its base, but most frequently free at the extremity. It has a wide geographical distribution, in Africa, Asia, and South America, principally the two latter, in warm regions. Dental formula:

\[ i_1 \sim 1 - 1 ^t \quad c_1 \sim 1 - 1 \quad m_1 \sim 5 - 5 \]

**MOLTKE, HELLMUTH, Count von, Field-marshal of the German empire, and chief of the general staff, who planned the Prussian campaign of 1866 against Austria, and the German campaign of 1870-71 against France. He belongs to an old family who had their seat for centuries in Mecklenburg, where Moltke was born, Oct. 26, 1800. Soon after his birth, his father, a military officer, left Mecklenburg and acquired an estate in Holstein. He and his brother were sent to the military academy in Copenhagen, where iron discipline and military frugality laid the foundation of his later character. In 1822 he entered the Prussian army as cornet. His parents having by this time lost all their fortune, he was left without any means whatever, and had to undergo many hardships to maintain himself in his position, from the very modest pay the Prussian officers receive; yet he managed to save enough to take lessons in modern languages, which afterward proved of great advantage to him. His eminent abilities soon procured him a place in the general staff. The time between 1843 and 1859 he spent in Turkey and Asia Minor, whither he was sent by the Prussian government to report on the war between that country and Mehemet Ali. Several anonymous publications of his, descriptive of the country and the war, are worthy of notice. After his return, he rapidly advanced through the different stages to the rank of general, continuing, however, on the general staff. His wonderful strategical powers were of immense service in the wars with Denmark (1863-64), Austria (1866), and France (1870-71); bringing them all to triumphant issues. At the end of the Austrian war he was rewarded with the order of the Black-Eagle, in 1870 he was created a count, and in 1871 he was raised to the rank of field-marshal. He published a work on the Franco-German war. Moltke is a man of great modesty and simplicity; he is reserved, and so little given to talk, that he has acquired the surname of "the Silent." The same composure and equanimity that he possesses in council, he also preserves in the heat of battle. See **GERMANY.**

**MOLUCCAS, or ROYAL ISLANDS, properly so called are Ternate, Tidore, Makian, Motir, and Batjan, lying to the w. of Gilolo, and washed by the Moluccas strait or passage, which separates Gilolo from Celebes. Ternate, the most important, is a volcanic mountain with plains at its base. The top is in 0° 48' 30" n. lat., and 127° 26' 30" e. long. Area 331 sq. miles. Pop. 8,394, of whom 100 are Europeans. The town is on the e. side and contains the sultan's palace, the Dutch residency, Protestant church, government school, etc. The island is fertile and well watered; the natives peaceful. They cultivate rice, cotton, tobacco, etc., trade with the adjacent islands, and build vessels, from the light skill and the tent-boat to the war-galley of 60 or 80 rowers, carrying two or more pieces of light artillery. Tidore is s. of Ternate, its n. point being 11° 11' n. lat., and 127° 7' e. long. Area 35 sq. miles. Pop. 8,157. The island is a volcano, 5,532 ft. high, and fertile for 3,000 feet. The natives are less gentle but more industrious than those of Ternate, and diligently cultivate the soil, weave, and fish. They are Mohammedans, and have many mosques. The sultans of Ternate and Tidore are subsidized by and subject to the Netherlands, exercising their authority under the surveillance of the resident. Makian lies in 0° 18' 30" n. lat., and 127° 24' e. long., is very fertile, yields much sago, rice, tobacco, canary-oil, etc., and has important fisheries. Pop. 5,000. The natives are industrious, make good nets, spin yarns, and weave coarse striped fabrics. Further n. in 0° 28' n. lat., and 127° 26' 50" e. long., is Motir, which formerly yielded a considerable quantity of cloves, and later sent much earthenware to all the Spice islands. Batjan, the only remaining Royal island, lies between 0° 13' to 0° 55' s. lat., and 127° 22' to 128° e. long., is 50 m., in length, and 18 in breadth, has many mountain peaks from 1500 to 4,000 ft. in height, the sources of numerous rivers. The greatest part of
this beautiful island is covered with ebony, satin-wood, and other valuable timber trees. Sago, rice, coconuts, cloves, fish, and fowls are plentiful, and a little coffee is cultivated. Coal is abundant, gold and copper in small quantities. The inhabitants, 3,800, who are lazy and sensual, are a mixed race of Portuguese, Spaniards, Dutch, and natives.

These islands are all volcanic. Ternate being a mountain, sloping upwards to 5,583 ft., to which Tidore bears a striking resemblance. Makian is an active volcano, which, so late as Dec., 1861, threw forth immense quantities of lava and ashes, by which 326 lives were lost, and 15 villages in part or in whole destroyed. Motir is a trachyte mountain, 2,296 ft. in height; and Batjan, a chain with several lofty peaks. Total population of the Moluccas proper, 23,551.

To the s.w. of Batjan lie the Obi group, consisting of Obi Major, Obi Minor, Typha, Gunona, Pisang, and Maya, of which Obi Major, in 1° 25' s. lat., and from 127° to 128° e. long., is by far the largest, having an area of 598 sq. miles. It is hilly and fertile, being covered, like the smaller islands of the group, with sago and nutmeg trees. They are uninhabited, and serve as lurking-places for pirates and escaped convicts. In 1671 the Dutch built a block-house, called the Brill; and a few years later the sultan of Batjan sold the group to them for $800; but the station being found unhealthy, the company abandoned it in 1768.

The Moluccas, or Spice Islands, in the broad use of the term, lie to the e. of Celebes, scattered over nearly 11 degrees of lat. and long., between 3° s. to 8° n. lat., and 126° to 135° e. long., including all the territories formerly ruled over by the sultans of Ternate and Tidore. They are divided into the residences of Ambon (q.v.), Banda (q.v.), and Ternate; a fourth residency being Menado (q.v.). Over the northern groups of the Spice islands the Netherlands exercise an indirect government, the sultans of Ternate and Tidore requiring to have all their appointments of native officials ratified by the resident. The southern groups are directly under European rule. The residency of Ambon consists of that island, sometimes called Leu-Timor, or Hitu, from the two peninsulas of which it is formed, Burm, the Ulasser group, and the w. part of Ceram. That of Banda includes the Banda, Keiling, Key, Arun, and other islands, also the eastern portion of Ceram. Under the residency of Ternate are placed the Moluccas proper, Great Banda, and the neighboring islands, and the S.w. of Papuan. In 1871, pop. of the Moluccas and dependencies, 4,214 Europeans and 750,869 natives.

Ambonaya, the Banda and Ulasser islands, chiefly supply the cloves, nutmegs, and mace which form the staple exports. The Banda islands are Neira or Banda-Neira, Great Banda, Ay or Way, Rhun, Rozingah, and Goenong-Api, containing an area of 588 sq. miles. In 1857, pop. 6,101, of whom 400 were Europeans; that of the whole residency, 110,302, including the eastern part of Ceram. The principal island of the group is Neira, s.e. from Ambonaya, in 4° 33' s. lat., and 130° e. long., separated by narrow straits from Goenong-Api on the w. and Great Banda on the east. The coast is steep, and surmounted by several forts and batteries, which command the straits and roadstead. The town of Neira, on the s. side of the island, is the capital of the Dutch residency of Banda, has a Protestant church, school, and hospital. The Banda islands have a rich soil, and are planted with nutmeg-trees, producing, in 1860, upwards of a million of nutmegs. The whole area of the archipelago is 1860 sq. miles. The land is nearly doubled since 1851. Pine-apples, the vine, banana, cocoa-nut, and other fruit-trees thrive, and are abundant. Ay is the prettiest and most productive of the group. Goenong-Api is a lofty volcano. There are wild cows, hogs, and deer; sea-carp and mackerel, which last are dried, and form with sago the food of the slaves. The c. monsoon begins in May, and the w. in December, and are accompanied with rain and storms. The climate is not particularly healthy.

The Ulasser, which, with Ambonaya, produce the cloves of commerce, are Saparoua, Oma or Haroukou, and Nousa-Laut. They lie to the e. of Ambonaya, in 3° 40' s. lat., and 128° 33' e. long., and have an area of 107½ sq. miles. Saparoua is the largest, and is formed of two mountainous peninsulas, joined in the middle by a narrow strip of undulating grassy land. Recently there were about 100,000 trees, producing 185,000 lbs. of cloves. The pop. amounts to 11,965, of whom 7,340 are Christians, and have 12 schools. Oma.-The sumptuous attendance of scholars—Oma, separated from Saparoua by a strait of a league in width, has 11 villages, of which Harouka and Oma are the chief. It is mountainous in the s., and has several rivers and sulphurous springs. The produce of cloves has amounted in one year to 40,000 lbs.; and the villagers possess 50,000 cocoa palm leaves, besides other fruit-trees. The woods abound with deer and wild hogs, the rivers with fish. Sago is grown, but not in sufficient quantities to meet the wants of the people, who draw further supplies from Ceram. The beautiful village of Harouka, on the w. coast, is the residence of the Dutch postholder, who is president of the council of chiefs. Here is the head office of the clove-produce. There are two forts on Oma, several churches, and 6 schools, with 700 pupils. Pop. 7,188, one-half Christians, the other Mohammedans.—Nousa-Laut lies to the s.e. of Saparoua. It is planted with clove-trees, which in one year produced 120,000 lbs. There are upwards of 30,000 cocoa-nut trees. The inhabitants, who formerly were pirates and cannibals, amount to 3,479 souls, are all Christians, and have schools in every village—in 1859 they were attended by 870 pupils.
The clove-tree and the nutmeg are indigenous to all the Spice islands, but the clove cultivation is confined to Amboyna and the Talleesers, the nutmeg to the Banda islands. Till 1824 the Dutch prohibited the planting of these trees in other parts, and caused those of native growth to be rooted out, in order to prevent smuggling, and to retain the supply of these spices to the European market. The Spice islands are generally healthy both for Europeans and Asiatics; and though the plants are sometimes very hot, mountains are always near, where it is pleasantly cool in the mornings and evenings. Besides the spice-trees, the bread-fruit, sago, cocoa-nut, banana, orange, guava, papaw, also ebony, iron-wood, and other valuable timber-trees, are abundant. The natives of some of the islands are Alios; of others, Malays on the coasts, and Alios in the interior. In Ceram are also Papuan negroes, brought originally from Bali and Papua as slaves.

The resident and other Dutch officials reside in the city of Amboyna, the streets of which are broad, planted with rows of beautiful trees, and cut each other at right angles. There are two Protestant churches, a town-house, orphanage, hospital, and theater, besides a useful institution for training native teachers, with which is connected a printing-press. Nutmegs, cloves, and cinnamon, are also found.

In 1851 the clove-produce amounted to 850,523 lbs., the number of trees planted being 405,659, of which one-third part were fruit-bearing; nutmegs, 537,861 lbs., and mace, 133,986 lbs.; the trees planted being 424,573, of which 297,372 were bearing. The total cost of the nutmegs and mace delivered in the Netherlands that year was £55,568 sterling, realizing £94,466. In 1859 the Moluccas sent to Java for the account of government, 2,012 piculs of mace (the picul = 133 lbs.), 81,101 of cloves, 6,536 of nutmegs, and 28 of cocoa-nut soup; the value being £59,416. The produce of nutmegs, in 1851, was 463,399 lbs.; in 1859 it had risen to 852,654, and in 1860 to 1,044,637. The clove crop varies much, as the following table will show: 1856, 617,250 lbs.; 1857, 1,896; 1858, 223,518; 1859, 300,888; 1860, 328,117. Amboyna and Banda have been free ports since 1857; but as government monopolizes the labor, there is no fair competition, and the people are slaves of the soil, their chiefs being paid in proportion to the produce delivered.

In 1521 Antonio de Brito first appeared to take possession of the Moluccas in the name of the king of Portugal; and after a long period of violence, intrigue, and perfidy, the Portuguese were driven out by the Dutch and natives, at the beginning of the 17th century. The change was of no advantage to the natives, for the Dutch, having obtained the exclusive right of buying all the cloves, at a nominal value, a series of wars ensued, which resulted in the subjugation of the Spice islands. Recently, new sultans of Ternate and Tidore have been appointed, with less power than their predecessors; and the wars with the Alios of Ceram, in 1859 and 1860, have brought them more fully under Dutch rule.

MOLY, a fabulous plant, said to be a panacea for all diseases, given by Hermes to Odysseus as a protection against the magical charms of Circe. It was supposed to be a variety of garlic. There is a kind of garlic still called "sorcerer's garlic," probably a reminiscence of the Circe legend.

MOLYBDENUM (sym. Mo; equiv. 48—new system, 96; sp. grav. 8.62) is a rare metal, which, in a state of purity, is of a silvery white color, has a strongly metallic luster, is brittle, and very difficult of fusion. It never occurs native, and its principal ore is the bisulphide, which much resembles graphite. It is also occasionally found oxidized in molybdic acid, leaf. The metal may be obtained by roasting the bisulphide in a free current of air, when the sulphur goes off oxidized as sulphurous acid, and the molybdic acid consists of very pure London proto-molybdenum. Molybdenum is usually treated and handled in the same manner as platinum. By the action of charcoal, the reduced metal is then obtained from the acid.

Molybdenum forms three compounds with oxygen—the protioxide (MoO), the binoxide (MoO), and molybdic acid (MoO). Of these three, the last alone has any practical value. Molybdenic acid is a white, glistening, crystalline powder, which is almost insoluble in water, fuses at a red heat, and unite, with bases, to form well-marked salts, the molybdates, which are either colorless or yellow. A solution of molybdate of ammonia is one of the most delicate tests for phosphoric acid.

Molybdenum forms various compounds with sulphur, chlorine, etc., none of which are of any practical importance, except the native bisulphide.

MOLYNEUX, WILLIAM, LL.D., 1656–98; b. Ireland; educated at Trinity college, Dublin, and afterwards a member of the middle temple, London. He had been instructed in mathematics by his father, Samuel Molyneux, who had written a work on gunnery, and he soon turned his attention from law to mathematics and optics. He was one of the founders and the first secretary of the Dublin philosophical society. Two years later he was made a member of the London royal society, and was sent by the English government to examine the fortifications in the Netherlands. In 1688 he was forced to leave Ireland on account of the political troubles there, but he came back after the battle of the Boyne. In 1692 he represented the Dublin university in the Irish parliament. His main work, the first in English upon the subject, is a treatise on optics, called Dioptrica. This book was revised by Halley, who included in the appendix his theorem for finding the foci of optic glasses. He also published a Translation of the Six Metaphysical Dissertations of Descartes, and numerous papers in the proceedings of the royal society. One of his
non-scientific works contains some interesting reminiscences of the war in Ireland—his Journal of the Three Months' Campaign of his Majesty in Ireland, 1690.

MOMBASSA, or MOMBRAZ, a seaport, of east Africa, in the territory of the sultan of Zanzibar, on a small coraline island off the coast, in the middle of an estuary formed by two small rivers, in lat. 4° 4's., and long. 39° 43' e., about 150 m. n. of Zanzibar island. The shores of the island are rocky and abrupt; and although the channel may be forded at low water, the attempt is attended with danger. The town has the usual Arab characteristics of ruin, neglect, and filth in a striking degree. The only object of interest, particularly, in 1596, by the Portuguese, and restored by them in 1635, as an inscription over the principal gateway indicates. It is a work of considerable pretension, with upwards of 100 guns in position, but in a ruined condition. The inhabitants, the majority of whom are sunk in abject poverty, mostly live in wretched hovels, scattered among what remains of the once magnificent buildings. The town and Island of Mombassa, as well as the surrounding district, is inhabited by the Wunika tribe. The harbor is still good, and is commodious and safe. Mombassa was visited by Vasco da Gama in 1497, when he found it to be a large and very prosperous town. It was held by the Portuguese during the greater part of the period from 1529 to 1720, when it appears to have become independent. The English held it from 1824 to 1836, when they resigned it. Since then it appears to have been possessed by the sultan of Zanzibar, and apparently is considered a place of some importance. Burton says that the inhabitants of Mombassa are "are justly taxed with pride, sordor, speaking, insolence, turbulence, and treachery by other Arabs." Pop. 13,000 to 15,000.

MOMENT, of any physical agency, is its importance with reference to some special application. Thus, the moment of a force applied (perpendicularly) to a lever, is the line of the path of the force as regards turning the lever about its fulcrum. It is, as we know (see LEVER), proportional to the product of the force by the distance of its point of application from the fulcrum. The moment of a force about any axis (to which its direction is perpendicular) is the product of the force by its least distance from the axis; and a similar definition is laid down for moment of velocity and moment of momentum. It is easy to see (see MOMENTUM) that in any system of mutually acting bodies the moment of momentum about any axis remains constant, since the equal mutual forces measure the momentum transferred from one body to another, and the moments of these forces are in pairs equal and opposite. A particular case of this is Kepler's law, that each planet describes equal areas in equal times about the sun.

Moment of Inertia.—In the rotation of bodies round an axis, the moment of inertia is the sum of the products of each particle of the body into the square of its distance from the axis; or if M be the body, m1, m2, m3, etc., the particles composing it, and r1, r2, r3, etc., their corresponding distances from the axis, then the moment of inertia of M = m1r12 + m2r22 + m3r32 + etc.; and if a quantity, k, be found such that Mk2 = m1r12 + m2r22 + m3r32 + etc., then k is called the radius of gyration. See CENTER OF GYRATION.

Momentum, or Quantity of Motion, is defined by Newton as proportional to the mass moving, and its velocity, conjointly. If we assume unit of momentum to be that of unit of mass moving with unit of velocity, we shall evidently have, for the momentum of a mass M, moving with velocity V, the expression MV. And such is the unit generally adopted.

It is shown by experiment that, when force produces motion in any body, the momentum produced in one second is proportional to the force—and, in fact, force is measured by the momentum it is capable of producing in unit of time. Thus, the same force, if acting for one second on each of a number of bodies, produces in them velocities which are inversely as their masses. Also when, as in the case of falling bodies, the velocities produced in one second are the same in all, we conclude that the forces are proportional to the masses; and, in fact, this is the physical proof that the weight of a body is proportional to its mass. Again, if different forces act, each for a second, on the same mass, the velocities produced are proportional to the forces acting, provided the different modes of statement of the experimental fact that force is proportional to the momentum it produces in unit of time; which forms a part of Newton's second law of motion.

When two masses act on each other, Newton's third law of motion (see Motion, LAWS) or shows that the forces they mutually exert are equal and opposite. This, in attraction or impact of two masses, no momentum is lost; since what is lost by one is gained by the other.

The momentum of a system of bodies can be resolved (as velocity is resolved) into components in any assigned directions, and the mutual forces of the system may be thus likewise resolved. Applying the previous result, we see at once that in any system of mutually acting bodies (such, for instance, as the solar system), no momentum is, on the whole, either gained or lost in any particular direction; it is merely transferred from one part of the system to another.

The fact that the conservation of momentum, has caused great confusion in the minds of pseudo-physicists, who constantly confound it with conservation of work or energy, a totally different thing.

The momentum produced by force in any period of time is measured by the product of the force and the time during which it has acted—the energy or work done by a force
Momentum is measured by the product of the force and the space through which it has acted. Momentum is proportional to the simple velocity of a body, and can never, by any known process, be transformed into anything else. Energy, when depending on velocity (see Force, Conservation of), is proportional to the square of the velocity, and is in the natural world constantly being transformed from its actual or kinetic form to its potential form, and back again, or to some other kinetic form, such as heat, and finally must become heat. Momentum, on the contrary, is never altered, either in kind or in amount.

In knocking down a wall, or in slaying in the whole side of a ship, the battering-ram of the ancients (when constructed of sufficient mass, and worked by the proper number of men or animals) was probably nearly as effective as the best modern artillery. But in making a breach in a wall, or in punching a hole in the armor of an iron-clad, mere massive shot with low velocities (such as those of the Dahlgren guns), are comparatively ineffective, however great their momentum; while an Armstrong or Whitworth projectile, with a fraction of the momentum, but with greater velocity, and, for its size, much greater kinetic energy, effects the object with ease.

In many every-day phenomena, we see most distinctly the difference between these two affections of matter. Thus, a blow delivered from the shoulder by a heavy pugilist, even if it be sluggishly given, generally does its man, without doing much other injury; but a sharp stroke administered by a light weight, while hardly disturbing the adversary's equilibrium, inflicts serious punishment.

MÖMIERS, French for maskers or comedians, is the name given in derision to a sect of evangelical Protestants of Switzerland and adjacent parts of Germany and France, who exhibited an uncommon degree of fervor in their religious services. They charged the national church with hypocrisy or the reformed faith especially by denying the divinity of Christ. This subjected them to opposition and restraint, so that ultimately, despairing of making progress, they went back to the church. The most distinguished man among them was the rev. César H. A. Malan, d.d., who having been brought up among Socinians continued to hold Socinian doctrines after his ordination as a minister in 1810, until in 1817, by means of friendly intercourse and discussion with Robert Haldane of Scotland and Dr. John M. Mason of New York, at that time sojourning at Geneva, he embraced evangelical doctrine, and was, 1820-1863, pastor of an independent congregation of Mômières.

MOMMSEN, Theodor, a distinguished writer on the history and polity of ancient Rome, was b. in 1817 at Garding, in Sleswick, where his father was a pastor in the Lutheran church. Mommsen studied first at Altona, and subsequently at the university of Kiel, where he graduated in arts in 1843. Having obtained some assistance from the academy of Berlin to defray the expenses of a prolonged course of travels, Mommsen spent three years in investigating Roman inscriptions in France and Italy, and from time to time published the result of his investigations in the annals of the archaeological institute of Rome and the Herullanian academy of Naples. The political disturbances of 1848 diverted Mommsen from his favorite pursuits; and for a time he devoted himself to politics, taking upon himself the editorship of the leading Sleswick-Holstein newspaper, for which he wrote the leading articles in the summer or 1848. Mommsen held for a short time a chair in the university of Leipsic, but his appointment was canceled on account of his strong political tendencies. He was made titular professor of law at Zurich in 1852, and at Breslan in 1854; while, since 1858, he has filled the chair of Roman law at Berlin. His attention has long been devoted to those branches of archaeology and ancient history with which his name is now so honorably associated. Among his most valuable contributions to these departments of knowledge, special mention must be made of the following: Die Unteritalischen Bischöfe (Leip., 1850); Corpus Inscriptionum Neapolitanarum (Leip. 1851); his monographs on The Chronography of the Year 535; and Roman Coins (Leip., 1850); the edition of Livy, Berlin, 1851; Inscriptionen Roma Meridianae (Leip., 1851). His great work on Roman history, Röm. Geschichte, fifth edition, 1865-70 (ably translated into English by W. P. Dickson); Römische Forscungen articles on special points of Roman antiquities (1st vol. Berlin, 1864); Römisches Staatsrecht (1st vol. Leip, 1871); Die Erzählung von Caius Marius Coriolanus; and his Digesta Institutioni Augusti (Berlin, 1865-70).

MOMOTICA, a genus of plants of the natural order compositae, having lateral tendrils, and the fruit splitting when ripe. Momoridica balsamina, a native of the south of Europe and of the east, produces a curious, oblong, much-warted fruit, called the Balsam Apple, which, when green, is infused in oil, to form a vulnerary much esteemed in Syria and some other countries. The ripe fruit is a dangerous poison. The plant is used to form arbors.—The large, red, thorny fruit of momordica nietsch, called got-kalka in India, is there used for food.—Momordica eburnata is called the gooseberry gourd, because its fruit, which is covered with bristles, is about the size and shape of a large gooseberry. The unripe fruit is used for pickling, and is sometimes to be seen in Covent Garden market.

MOMOT or MÖMOT, the common name for the different species of birds belonging to the genus priorities of Illiger. Some have placed the momot as a genus, and it has also been proposed as a family. Its place is, however, rather uncertain. It has been
assigned to the coracidiae. The genus *priornies* has the following characteristics. Both mandibles slightly curved and compressed; the margins with strong denticulations; tongue long and slender, with the sides ciliated; wings short and rounded; tail long and pointed. Dr. G. R. Gray makes the monodine, a sub-family of the *boletide*, consist of the genus *crypticus* (priornies of Swainson), and the genus *monotis* (priornies of Illiger, monota of Shaw, and rhamphastos of Linnaeus).

**MOMOTOMBO**, a volcano of the Marabique range, near lake Managua, 25 m. n.e. of Leon in Nicaragua. Its height is 7,200 ft., of which more than one-third is composed of the ashes and cinders ejected in past ages. It is still active, but has had no serious eruptions for many years. Among other traditions connected with it is one, embodied in Victor Hugo's *Le Legende des Siecles*, which tells of an attempt by Spanish priests to ascend and plant the cross on its summit: they were never heard of afterwards; and the ascent remains to this day unaccomplished.

**MOMOX**, a t. of the United States of Colombia, on the Magdalena, 110 m. s.e. of Cartagena. Here the Magdalena, during its periodical floods, rises 12 or 15 ft. above its usual level; and the quay and custom-house of Momox are built unusually high, in order to provide against this emergency. All the foreign goods destined for the consumption of the valley of the Magdalena pass through this town. Pop. estimated at 10,000.

**MOMUS**, in fabulous history, the god of raillery, or the jester, who ridiculed both gods and men. He is the personification of mocking censure. Being requested by Vulcan, Neptune, and Minerva, to give his opinion as to their works, he blamed them all: Neptune, for not making his bull with horns before his eyes, in order to give a surer blow; Minerva, for building a house which could not be moved in case of bad neighbors; Vulcan, for making a man without a window in his breast, that his secret thoughts might be seen. Venus alone was blameless. For his free censure of the gods he was expelled from heaven. He is generally represented as raising a mask from his face, and holding a small figure in his hand. He is according to Hesiod the progeny of Night.

**MONACHISM** (Gr. *monachos*, a monk, from *manos*, alone) may in general be described as a state of religious retirement more or less complete, accompanied by contemplation, and by various devotional, ascetical, and penitential practices. It is, in truth, ascetism (q.v.), with the element of religious solitude superadded. The institution of monachism has, under different forms, entered into several religious systems, ancient and modern. That it was known among the Jews before the coming of our Lord, appears from the example of the prophet Elias, and from that of the Essenes; and it is probable that religious seclusion formed part of the practice of the Nazarites (q.v.), at least in the later periods of Jewish history. In the Brahmanical religion, it has had a prominent place, and even to the present day, the *banaos* of Tibet may be said to rival in numbers and extent the monasteries of Italy or Spain. The Christian advocates of monachism find in the gospel exhortations to voluntary poverty (Matt. xix. 21) and to celibacy (1 Cor. vii. 37), at once the justification and the origin of the primitive institution. Its first form appears in the practice of ascetism, of which we find frequent mention in the early part of the 2d century. The primitive ascetics, however, lived among the brethren, and it is only in the following century that the peculiar characteristic of monachism begins to appear. The earliest form of Christian monachism is also the most complete—that already described under the head Anchorites (q.v.); and is commonly believed to have in part originated in the persecutions, from which Christians were forced to retire into deserts and solitary places. The anchorites maintained from choice, after the cessation of the persecutions, the seclusion to which they had originally resorted as an expedient of security; and a later development of the same principle is found in the still more remarkable psychological phenomenon of the celebrated Pillar-saints (q.v.). After a time, however, the nomenclature of the religious life itself—as the attendance at public worship, the participation of the sacraments, the desire for mutual instruction and edification—led to modifications of the degree and of the nature of the solitude. First came the simplest form of common life, which sought to combine the personal seclusion of individuals with the common exercise of all the public duties: an aggregation of separate cells into the same district, called by the name *Laura*, with a common church, in which all assembled for prayer and public worship. From the union of the common life with personal solitude is derived the name *cenobite* (Gr. *koinos bios*, common life), by which this class of monks is distinguished from the strict solitaries, as the anchorites or eremites, and in which is involved, in addition to the obligations of poverty and chastity, which were vowed by the anchorites, a third obligation of obedience to a superior, which, in conjunction with the two former, has ever since been held to constitute the essence of the religious or monastic life. The first mention of the name of Saint Anthony (q.v.), who may be regarded as its founder in the east, either by himself or by his disciples. So rapid was its progress, that his first disciple, Pachomius (q.v.), lived to find himself the superior of 7,000. In the single district of Nitria, there were no fewer than 50 monasteries (Sozomen, *Eccles. History*, vi. 31), and before long, the civil authorities judged it expedient to place restrictions on their excessive multiplication. It seems to be admitted, that, in the east, where asceticism has always been held in high estimation, the example of Christian monasticism
had a powerful influence in forwarding the progress of Christianity; although it is also certain that the admiration which it excited occasionally led to its natural consequence among Agemnesia, by exciting a spirit of pride and ostentation, and by provoking sometimes to fanatical excesses of austerity, sometimes to hypocrirical simulations of rigor. The abuses which arose, even in the early stages of monachism, are deplored by the very Fathers who are most eloquent in their praises of the institution itself. These abuses prevailed chiefly in a class of monks called Sarribailers, who lived in small communities of three or four, and sometimes led a wandering and irregular life. On the other hand, a most extraordinary picture is drawn by Theodore, in his Religious History, of the rigor and mortification practiced in some of the greater monasteries. The monks were commonly zealots in religion; and much of the bitterness of the religious controversies of the east was due to that unrestrained zeal; and it may be added that the opinions which led to these controversies originated for the most part among the theologians of the cloisters. Most of these ascetics, and in particular, those engaged in the observance of the services of the church day and night without interruption, are called Monophysites, Monothelists, Nestorians.

Image-Worship.

It was in the cenobitic rather than the eremitic form that monachism was first introduced into the west, at Rome and in northern Italy by Athanasius, in Africa by St. Augustine, and afterwards in Gaul by St. Martin of Tours. Here also the institute spread rapidly under the same general forms in which it is found in the eastern church; but considerable relaxations were gradually introduced, and it was not until the thorough reformation, and, as it may be called, religious revival effected by the celebrated St. Benedict (q.v.), in the beginning of the 6th c., that western monachism assumed its peculiar and permanent form. In some of the more isolated churches, as, for instance, that of Britain, it would seem that the reformation of St. Benedict were not introduced until a late period; and in that church as well as in the church of Ireland, they were not the subject of considerable controversy. One of the most important modifications of monachism in the west, regarded the nature of the occupation in which the monks were to be engaged during the times not directly devoted to prayer, meditation, or other spiritual exercises. In the east, manual labor formed the chief, if not the sole external occupation prescribed to the monks; it being held as a fundamental principle, that for each individual the main business of life was the sanctification of his own soul. In the west, besides the labor of the hands, mental occupation was also prescribed, not, it is true for all, but for those for whom it was especially calculated. From an early period, therefore, the monasteries of the west, and particularly those of Ireland, or of the colonies, founded by Irish monks, as Iona and Lindisfarne, became schools of learning, and training-houses for the clergy. At a later period, most monasteries possessed a scriptorium, or writing-room, in which the monks were employed in the transcription of MSS.; and although a great proportion of the work so done was, as might naturally be expected, in the department of sacred learning, yet it cannot be doubted that it is to the scholars of the cloister we owe the preservation of most of those among the master-pieces of classic literature which have reached our age.

In the remarkable religious movement which characterized the church of the 12th c. (see Francis of Assisi, Franciscans), the principle of monachism underwent a further modification. The spiritual egotism, so to speak, of the early monachism, which in some sense limited the work of the cloister to the sanctification of the individual, gave place to the more comprehensive range of spiritual duty, which, in the institute of the various bodies of friars (q.v.) which that age produced, made the spiritual and even the temporal necessities of one's neighbor equally with, if not more than, one's own, the object of the work of the cloister. The progress of these various bodies, both in the 12th c. and since that age, is detailed under their several titles. It only remains to detail the later history of monachism, properly so called. The monastic institutes of the west are almost all offshoots or modifications of the Benedictines (q.v.); of these, the most remarkable are the Cistercians, Cistercians, Grandmontines, Cluniacenes, Premonstratensians, and above all Maurists, or Benedictines (q.v.) of St. Maur. In more modern times, other institutes have been founded for the service of the sick, for the education of the poor, and other similar works of mercy, which are also classed under the denomination of monks. The most important of these are described under their several heads.

The inclosure within which a community of monks reside is called a monastery (q.v.)

—Gr. monasterion, Lat. monasterium. By the strict law of the church, called the law of cloister or inclosure, it is forbidden to all except members of the order to enter a monas-

tery; and in almost all the orders, this prohibition is rigidly enforced as regards the admission of females to the monasteries of men. To such a length is this carried in the Greek church, that in the celebrated inclosure of Mount Athos, not only women, but all animals of the female sex are rigorously excluded. The first condition of admission to a monastic order is the approval of the superior, after which the candidates remain for a short time as postulants. After this preliminary trial, they enter on what is called the novitiate, the length of which in different orders varies from one to three years; and at its close, they are admitted to the profession, at which the solemn vows are taken. The age for profession has varied at different times and in different orders; the council of Trent, however, has fixed 16 as the minimum age. Originally, all monks were lay.

Monachisms.

114

men; but after a time, the superiors, and by degrees other more meritorious members, were admitted to holy orders. The distinction of priest-monks and lay-brothers has been already explained under the head PRIOR; but in both alike, where the order is one of those solemnly approved by the church, the engagement taken at the final profession is life-long and irrevocable.

The monastic institute, from the very earliest time, embraced women as well as men. The former were called in Greek by the name ηοιδα or ηοινα, and in Latin moneta (from which the English nun), as also sanctionum. The cloistered residence of nuns is called by various names, as NUNNERY, CONVEXT, a name also applied to the houses of women for beggars.

The general characteristics of the monastic institute for females are substantially identical with those of the male orders; and as the principal varieties of institute are detailed under their respective heads, it is needless to particularize them here.

It is hardly necessary to say that the reformed churches in the 16th c. discarded the practice of monachism, and suppressed the monastie houses. In some of the German states, the temporalities of the suppressed monasteries were retained, and were granted at pleasure by the sovereign, to be enjoyed together with the titular dignity. Some of the German churches, however, in later times, have revived the institute both for men and for women, as has also been done in the Anglican church both in the time of Laud and in our own day. In all these Protestant revivals of monachism, however, the engagement is revocable at the will of the individual. At the French revolution, the monastie establishments of France were utterly suppressed; and in most of the other Catholic countries, especially in Italy, the orders have been, to a greater or less extent, in England and Ireland and America, on the contrary, the institute has made rapid progress within the last 20 years. Most of the orders, however, introduced into these countries are of the active rather than the contemplative class.

MONACO, a small principality of Italy, on the coast of the Mediterranean sea, a few miles n.e. of the city of Nice. The climate is fine, as that omages, lemons, etc., are produced in abundance. Pop. 7,370. Mon. 1,711. From the birth of Christ to 1814 the principality of Monaco was governed by the Genoese family of Grimaldi. In 1815 it was ceded to Sardinia, which, however, recognized its independence, but reserved to itself the right of garrisoning the town of Monaco. At this period it consisted of three communes—Monaco, Mentone, and Roccapbruna, with an area of 52 sq.m., and a pop. of about 7,000. In 1848 Mentone and Roccabruna were annexed to Sardinia, in spite of a protest by his "serene highness," Carlo Honorio, third prince of Monaco. The Italian war of 1859 placed the whole territory for a brief period under Victor Emmanuel; but Carlo Honorio having sold Mentone and Roccabruna (Feb. 2, 1861) to the French emperor for 4,000,000 francs, Sardinia was obliged to renounce her hold upon them. The sovereign prince of Monaco now possesses nothing but the city and a small patch of territory, with a total area of 6 sq.m.; pop. 7,574. The town is a beautiful place on a rocky promontory, with 2,667 inhabitants.

MONAD (Gr. monas, unity), a term borrowed from the Peripatetic philosophy, although employed by moderns in a sense different from that of the Peripatetics, who used it to designate the universe, understood in the pantheistic sense. By moderns, and especially by Leibnitz (q.v.), from whose system alone the name has derived importance, it is used to describe the primary elements of all matter. The monads are simple uncompounded substances, without figure, without extension, without divisibility, by the aggregation of which all bodies are formed, and into which all compounded things may ultimately be resolved. The monads are created things, but as being uncompounded, are indestructible; and although subject to change, the change is but external or relative. They are of two classes—the first are destitute of consciousness, although possessing an internal activity which is called by the name of perception; the second possess, in addition to perception, a certain consciousness, which is called by the name "apperception" or consciousness-perception. The monads of this class are souls, and according to the degree of their consciousness is the distinction between the souls of the higher and those of the lower intelligences. The Deity is the Prime MONAD, or Monad of monads. The theory of monads enters largely into the philosophical system of Leibnitz, and indeed furnishes the key to much in that system which is otherwise obscure.

MONAD. Monas, the generic name of many kinds of microscopic organisms, very minute, and supposed also to be of very simple organization. They appear, even under a powerful microscope, as mere points, moving rapidly through the fluid in which they exist, and often becoming aggregated in clusters; or they are seen to be gelatinous and granular, or nearly so, with a tail or thread-like filament, by the vibration of which they move. When the fluid is tinted by means of some harmless coloring matter, the existence of several cells or vesicles is discerned within the minute body. Ehrenberg, therefore,classed them among polygastric infusoria (see INFUSORIA), and no naturalist doubted their right to a place, although one of the lowest, in the animal kingdom. They are now universally regarded as vegetable, and are ranked among algae. The organisms formerly known as globule animalcules (roloce) are clusters of monads produced by gemmation from one, and invested with a common envelope. Monads are of various colors. Their gemmation takes place according to fixed laws, so that the groups assume particular forms, characteristic of the different kinds. Thus, in the "breast-plate animalcule" (gonium pectorale), so called from the form which the group frequently presents, a divi-
philosophy. From pagan religion it could not have come, unless very indirectly, as that took little thought of the unity of God. But whatever its origin, it was embraced by two classes, who differed greatly in their application of the theory: the one, who may be called rationalistic, admitted the divinity of Christ only as being at most a mere power; the other, some of whom were Patripassians, identified the Son with the Father, and lowered at most only a trinity of manifestation. "The one," says Schaff, "reduced the dignity of the Son, the other the dignity of the Father; yet the latter was by far the more profound and Christian, and accordingly met with the greater acceptance."

2. Those of the first class saw in Christ a mere man filled with divine power; but conceived this divine power as present in him not merely from his baptism, but from the beginning, and admitted his supernatural conception through the Holy Ghost. The second class, whom Tertullian called Patripassians, while they professed Unitarian opinions, strove also to hold fast the divinity of Christ; and, as they thought, accomplished their object by merging his independent personality in the essence of the Father. Sabellius, about the middle of the 3d c., denying both trinity of essence and permanent trinity of manifestation, taught that the unity of God, without distinction in itself, after the creation, unfolds itself in the course of the world's development in three different forms and periods of revelation, and after the completion of redemption, returns into unity. The Father (he said) reveals God in the giving of the law and the Old Testament economy; the Son reveals God in the incarnation; and the Holy Ghost reveals God in inspiration. He illustrated this trinity of relations by comparing the Father to the sun, the Son to its enlightening power, and the Spirit to its warming influence. Athanasius pointed out coincidences of thought in the stile philosophy with the doctrine of Sabellius, which, however, is generally admitted to have been thought out independently in his own mind. He may be regarded as the most original, ingenious, and profound of the monarchians. His system has been revived by Schleiermacher in a very modified form; and is substantially held in still later times by some who, holding to Christ's supreme divinity, deny the union in him of the human and divine natures, and suppose that he was God dwelling in human flesh and subject to its limitations and infirmities. It will be seen that the general principle of monarchianism admits various modifications in theory and practice into a doctrine of a pure and simple divinity in Christ, and in the opposite extreme to a position scarcely distinguishable from the standard doctrine which has been upheld in the church. See Incarnation, Trinity.

MONARCHY (Gr. monarchia, from monos, alone, and archo, to govern; literally, the government of a single individual) is that form of government in a community by which one person exercises the sovereign authority. It is only when the king, or chief magistrate, is a member of the ruling or governing body of the community that the proper pronunciation of the term, a monarch. Most of the oriental governments past and present, Russia at present, and Spain and France as they were in the last century, are in this strict sense monarchs. The degenerate form of monarchy is tyranny, or government for the exclusive benefit of the ruler. When the head of the state, still possessing the status and dignity of royalty, shares the supreme power with a class of nobles, with a popular body, or with both, as in our own country, the government, though no longer in strictness monarchial, is called in popular language a mixed or limited monarchy, the term absolute monarchy being applied to a government properly monarchical. The highest ideal of government would perhaps be attained by an absolute monarchy, if there were any security for always possessing a thoroughly wise and good monarch; but this condition is obviously unattainable, and a bad despot has it in his power to inflict infinite evil. It therefore becomes desirable that a governing class, composed, if possible, of the wisest and most enlightened in the country, should share the supreme power with the sovereign.

A limited monarchy has this advantage over an aristocratic republic that, in difficult crises of the nation's existence, royalty becomes a neutral and guiding power, raised above the accidents and struggles of political life.

Monarchy, most usually hereditary, has sometimes been elective, a condition generally attended with feuds and distractions, as was the case in Poland. The elective system is still followed in the choice of the pope. Constitutional monarchy may be in its origin elective, or combine both systems, as when one family is disinherited, and the scepter declared hereditary in the hands of another under certain conditions. See King, Republic.

MONASTERY has been described under the head of Monachism (q.v.) as the generic name of the residence of any body of men, or even, though move rarely, of women, bound by monastic vows. It may be useful, however, to detail the various classes of monastic establishments of the western church, and to point out the leading characteristics of each. The name, in its most strict acceptance, is confined to the residences of monks, properly so called, or of nuns of the cognate orders (as the Benedictine), and as such, it comprises two great classes, the abbey and the priory. The former name was given only to establishments of the highest rank, governed by an abbot, who was commonly assisted by a prior, sub-prior, and other minor functionaries. An abbey always included a church, and the English word monastery, although, like the cognate German Ministerium, it has now lost its specific application, has its origin in the Latin monasterium. A priory supposed a less extensive and less numerous community. It was governed by
a prior, and was originally, although by no means uniformly, at least in later times, subject to the jurisdiction of an abbey. Many priories possessed extensive territorial domains, and of these, not a few became entirely independent. The distinction of abbey and priory is found equally among the Benedictine nunns. In the military orders, the name of commandery and preceptory corresponded with those of abbey and priory in the monastic orders. The establishments of the mendicant, and, in general, of the modern orders, are sometimes, though less properly, called monasteries. Their more characteristic appellation is friary or convent, and they are commonly distinguished into professio houses (called also residences), novitiate, and colleges, or scholastic houses. The names of the superiors of such houses differ in the different orders. The common name is rector, but in some orders the superior is called guardian (as in the Franciscan), or master, major, father, prior, etc. The houses of females—convent in the Benedictine or Cistercian orders—are called indifferently convent and nunnerie, the head of which is styled mother superior, or reerved mother. The name cloister properly means the inclosure; but it is popularly used to designate, sometimes the abradical ambulatory which runs around the inner court of the building, sometimes, in the more general sense, of the entire building, when it may be considered as synonymous with convent.

MONASTIR, TODI-MONASTIR, or BITOLJA, a t. of European Turkey, capital of the vilayet named after it, is situated in a broad valley of the Nijji mountains, 90 m. n.e. of Janina, and about the same distance w.n.w. of Saloniki. It is an important place, is the residence of the governor-general, and commands the routes between Macedonia and northern Albania. The inhabitants are mostly Greeks and Bulgarians. Monastir has 11 mosques, and carries on a large trade with Constantinople, Saloniki, Vienna, and Trieste. From Constantinople alone it annually buys goods to the value of £1,500,000. Its bazaars, containing more than 2,200 shops, are well stocked with the products of western Europe and the colonies, as also with native manufactures. Yet it is one of the worst built and most tasteless towns in all Turkey. Pop. 34,000.

MONASTIR, a seaport t. of north Africa, in the dominion of Tunis, 80 m. s.s.e. of the city of that name, on the gulf of Sidra. Woolen and cotton fabrics are manufactured, and there is some maritime trade. Pop. 12,000.

MONBCDDO, James Burnet, Lord, a Scottish lawyer and author, was b. at Monboddo, in Kincardineshire, in 1714, educated at Marischal college, Aberdeen, where he displayed a great fondness for the Greek philosophers, and afterwards studied law for 3 years at Groningen, in Holland. In 1737 he became a member of the Scottish bar, and soon obtained considerable practice; but the first thing that brought him prominently into notice was his connection with the celebrated Douglas case, in which Mr. Burnet acted as counsel for Mr. Douglas. In 1767 he was raised to the bench by the title of lord Monboddo. He died May 26, 1790. Monboddo's first work, on the *Origina and Progress of Language* (1771-76), is a very learned, heretical, and eccentric production; yet in the midst of its grotesque crotchet's there occasionally flashes out a wonderfully acute observation, that makes one regret the distorted and misapplied talent of the author. The notion that men have sprung from monkeys, is perhaps that which is most commonly associated with the name of Monboddo, who gravely asserted that the orang-outangs are members of the human species, and that in the bay of Bengal there exists a nation of human creatures with tails, and that we have only worn away ours by sitting on them, but that the stumps may still be felt. Monboddo wrote another work, entitled *Ancient Metaphysics*, which was published only a few weeks before his death.

MON BUTTOO, a country in central Africa, between 3° and 4° n. lat., and 28° and 29° e. long.; 4,000 squ.m.; estimated pop. 70, 1,000,000. It is an elevated table-land, 2,500 ft. above the sea. The Keebulay and Gaddhu rivers flow through it, uniting to form the Welle, which, after a westerly course through s. Nyam-Nyam, joins the Shary, the source of lake Tchad. The soil spontaneously produces so many fruits and edible roots that cultivation is small, restricted for the most part to tobacco, sugar cane, and sesame. There are few domestic animals. The inhabitants are lighter colored than the surrounding nations; they are cannibals, fond of the chase, skilful in the working of copper, iron, and wood. Polygamy and circumcision are practiced. The art of weaving is unknown. There is a considerable trade in ivory.

MON CADDA, Don Francisco de, Conde de Osona, an historian and one of the Spanish classics, b. Dec. 29, 1586, at Valencia, where his grandfather was then viceroy. Descended from one of the greatest families of Catalonia, he rapidly rose to the highest offices in the state, was ambassador to Vienna, and latterly governor of the Netherlands, and commander-in-chief of the Spanish troops there. He distinguished himself both as a statesman and a soldier. He fell at the siege of Goch, a fortress in the duchy of Cleves, in 1635. His *Historia de la Expedición de Catalones y Aragoneses contra Turcos y Griegos* (Barcelona, 1633, and frequently reprinted), is a masterpiece in Jitelligence and elegance of style.

MONCALIERI, a t. of Italy, in the province of Turin, situated finely on the slope of a hill, on the right bank of the Po, 5 m. above Turin. Pop. 3,090. Moncalieri is the first railway station on Turin and Genoa, and communicates daily with Turin by frequent omnibuses: it has fine buildings, including a palace lately embellished for the
residence of king Victor Emmanuel. The annual cattle-fair held in October at Moncalieri is the most important of the north of Italy.

MONCK, a co. in s. Ontario, on lake Erie; 373 sq.m.; pop. 16,189. The Canada Southern, the Grand Trunk, and the Great Western railroads pass through it.

MONCK, CHARLES STANLEY, Viscount, b. Ireland, 1819; educated at Trinity college, Dublin, and called to the Irish bar in 1841. He was elected to parliament as a liberal member for Portsmouth in 1852, and re-elected in 1855, but was unsuccessful in 1857. He was a lord of the treasury from 1855 to 1858, and was appointed governor-general of Canada in 1861. He was reappointed in 1867, but resigned the next year. In 1871 he served on the Irish national education commission, and on the commission to carry out the act for the disestablishment of the Irish Church. He succeeded his father as viscount in the peerage in 1849, and was made a viscount in the peerage of Great Britain in 1866.

MONCREIFF-WELLWOOD, Sir Henry, 1750-1837; b. Scotland; son of the rev. sir William Moncreiff, and assumed the additional name of Wellwood late in life. Having been educated at Glasgow and Edinburgh, he was ordained, 1771, as successor to his father at Blackford, and continued there until 1775, when he became minister of St. Cuthbert's, Edinburgh. Always a member of the evangelical party in the church, he became at length its leader. His published works are: Discourses on the Evidence of the Jewish and Christian Revelations; The Life and Writings of Dr. John Erskine; and Sermons, 3 vols.

MONCTON, a t. in Canada, province of New Brunswick, co. of Westmorland, the terminus of the Moncton to St. John's division of the Intercolonial railway; pop. 4,810. It is a port of entry, with a convenient harbor, very pleasantly located at the head of navigation of the Petitcodiac river, which empties into Chignecto bay, the n. extremity of the bay of Fundy. It has several hotels, 4 churches, a variety of stores, and a telegraph office. It contains the offices of the Intercolonial railway and repair shops. It has 2 banks, and its leading industries are the manufacture of steam-engines, machinery, cigars, leather, hardware, and castings. It has a great trade in lumber.

MONDAY (Ger. Montag, Lat. Lunae Dies, the day of the moon, Fr. Lundi), the second day of the week. The name descends from the Romans, who named the days of the week after the planets.

MONDOÑE DO, a t. in Galicia, Spain, n.n.e. of Lugo; pop. 2,452. It has a cathedral and a castle. There are tanneries, and manufactures of cotton cloth, and linen.

MONDONI, an episcopal t. in Cuneo, one of the northern provinces of Italy, situated on the summit and shoulder of an Alpine hill, 50 m. s. of Turin. It is divided into four sections: the piazza—encircled by walls, and containing the chief buildings of the place, and the suburbs, Carassone, Breo, and Piano del Valle. In the neighborhood considerable activity exists in cloth, silk, and bonnet-straw manufactories; but in spite of vineyards and chestnut woods, the numerous remains of ruined buildings in its vicinity import an air of desolation to the locality. The Piazza contains a fine cathedral, with a noble gallery of monuments; and the various judicial and educational buildings. Pop. 12,309. At the battle of Monlev, on April 22, 1793, the Sardinians were totally defeated by Bonaparte, and the entrance into Piedmont secured to the French army. The province of Mondovi is intersected by spurs of the Alps, and contains rich marble quarries and valuable mineral products.

MONEA BARK, the bark of a tree, chrysophylhun glycyphylhum, or C. Buranfein, of the same genus with the star apple (q.v.), a native of the s. of Brazil. The bark is hetercescent; but when dried, it is thick, flat, compact, heavy, brown, and hard, with a taste at first sweet, afterwards astringent and bitter. A substance called monesia is extracted from it, which is almost black, at first sweet, then astringent, and finally acid. It is used as a stomachic and alterative in enterorrhca, chronic diarrhoea, etc. It contains, in small quantity, a principle called monesia.

MONETARY COMMISSION of the U. S. Congress. The mistaken demonetization of silver by congress in the coinage act of Feb. 12, 1873, passing almost unnoticed during that year, soon afterwards attracted the attention of thoughtful men. Its possible consequences loomed portentously into view, as the subject was more and more studied. Within three years it became a theme of general discussion in the United States. It was a prolific source of debate in the 44th congress; and on Aug. 15, 1876, the senate initiated a joint resolution for the appointment of a joint commission of three senators, three members of the house, with experts, not exceeding three, to be selected by the former, whose duty was to inquire. "First, Into the change which has taken place in the relative value of gold and silver; the causes thereof, whether permanent or otherwise; the effects thereof upon trade, commerce, finance, and the productive interests of the country, and upon the standard of value in this and foreign countries: Second, Into the policy of the restoration of the double standard in this country; and, if restored, what the legal relation of the two coins, silver and gold, should be; Third, Into the policy of continuing legal-tender notes concurrently with the metallic standards, and the effect thereof

118
upon the labor, industries, and wealth of the country; Fourth, Into the best means for providing for facilitating the resumption of specie payments."

The commission, as organized consisted of Messrs. John P. Jones, Lewis V. Bogy, and George S. Boutwell, of the senate; Randall L. Gibson, George Willard, and Richard P. Bland, of the house of representatives; Wm. S. Groesbeck of Ohio, and Prof. Francis Bowen of Massachusetts. Geo. M. Weston of Maine was appointed secretary. The sessions of the committee were held in New York until December of that year, and afterwards in Washington. Circulars were immediately issued by the commission to men of eminence in monetary studies, to authors, bankers, and business men in the United States and Europe, to elicit the widest possible information on the topics of the resolution. The chambers of commerce in the cities were invited to furnish, and did furnish, lists of persons most competent to give information. The U. S. representatives in foreign countries were required to aid in the work. The commission entered upon its duties with energy, collected vast stores of information, and were aided by the most eminent political economists and financial writers of all schools, who were glad to have such an opportunity for the elucidation and comparison of their views. The main substance of the report was submitted and ordered to be printed Mar. 2, 1877. It is a masterly condensation of the philosophy and facts bearing on money questions; embracing clear statements of all schools of opinion. The conclusions of the commission were not unanimous. But the majority report not only exhibits such grasp of the whole subject, but has also been so far proved correct in its deductions by facts which have since become a part of monetary history, that the several dissent of individual members of the committee from certain parts of the majority report are not of much importance. On the whole, the report is the most valuable compendium of facts and monetary theories ever published. It takes rank in point of ability with the famous bullion report of England in 1810, but covers a far wider field, and introduces social science problems in connection with the money question not taken into consideration by the British committee. The latter sifted financial questions from bankers' points of view; the U. S. commission reviews the subject in the light of the public weal—the greatest good to the greatest number.

The conclusions of the majority of the committee on the first questions submitted are:

That the recent production of silver relatively to gold has not been greater than formerly; that the (then) recent fall in the price of silver was not caused by any recent large production; but mainly by the concurrent demonetization of silver in Germany, the United States, and the Scandinavian states, the closure of the mines of Europe to its coinage, the temporary diminution of the Asiatic demand, the exaggeration of the actual and prospective yield of the Nevada silver mines, and a prevailing idea that the efforts of holders of government securities would bring about its demonetization; that gold is now more fitly in production than silver; that the average production of both is more steady than of either one; that to annihilate the money function of one must greatly increase the purchasing power of the other, and greatly reduce prices; that "silver to the amount of $3,000,000,000 in coin, the accumulation of 50 centuries, is so worked into the web and woof of the world's commerce that it cannot be discarded without entailing the most serious consequences, social, industrial, political, and commercial;" that "the evil is enormously aggravated by selecting gold as the metal to be retained and silver as the metal to be rejected;" that "the exchanges of the world, and especially of this country, are continually and largely increasing, while the supplies of both the precious metals, taken together, if not diminishing are at least stationary, and the supply of gold, taken by itself, is falling off; and that to submit the vast and increasing exchanges of this country to the uncertainties of the amounts, never measured, never in the sun, and now actually diminishing in its production, would make crisis circumstances of our time into a state of paralysis perpetual." Covering the second question the commission recommend the restoration of the double standard and the unrestricted coinage of both metals. The report on the third question for solution refers to the answer to the fourth, viz., "the best means for providing for facilitating the resumption of specie payments." To this question the report answers, that "the demonetization of silver is a measure essential to specie payments, and may make such payments practicable." The commission believe "that the demonetization of silver in this country will have a powerful influence in preventing, and probably will prevent, the demonetization of silver in France and other European countries;" that demonetization by the United States, even without change in legislation elsewhere, will draw to us silver from other countries while it is cheap, in exchange for what we have to export; and that this country will have the benefit of the rise which the committee believe will take place in its value when the temporary causes of its depression have passed. The report concludes with these words: "If the states of the Latin Union, or other countries in Europe, abandon the double standard after we re-adopt it, or because we re-adopt it, it will be a policy on their part through which great advantages will inure to us, and great disasters will befall them. It would inaugurate in the United States an era of prosperity, based upon solid money, obtained on profitable terms, and under circumstances necessarily stimulating to our industry and commerce."

"Finally, the commission believe that the facts that Germany and the Scandinavian states have adopted the single gold standard, and that some other European nations may possibly adopt it, instead of being reasons for perseverance in the attempt to establish it
in the United States, are precisely the facts which make such an attempt entirely impracticable and ruinous. If the nations on the continent of Europe had the double standard, a gold standard would be possible here, because, in that condition, they would freely exchange gold for silver. It was that condition which enabled England to resume specie payments in gold in 1821. The attainment of such a standard becomes difficult precisely in proportion to the number and importance of the countries engaged in striving after it; and it is precisely in the same proportion that the ruinous effects of striving after it are aggravated. To propose to this country a contest for a gold standard with the European nations is to propose to it a disastrous race, in reducing the price of labor and commodities, in aggravating the burdens of debt, and in the diminution and concentration of wealth, in which all the contestants will suffer immeasurably, and the victors even more than the vanquished."

Mr. Boutwell alone makes a minority report against remonetization of silver, except on a previously agreed basis, adopted in conjunction with European nations. Prof. Francis Bowen expresses his dissent from the conclusions of the majority of the committee at much length; and, while he argues for the gold basis alone, he finally reports in favor of the remonetization of silver, on adding to the quantity of pure silver in a dollar enough to make its bullion value equal to the then value of gold per dollar, and also recommends the reduction of the value of our gold coins, so that a five dollar piece shall be the equivalent of the English pound sterling. He also recommends that the paper money of the government should be gradually taken up by the treasury department and destroyed. In addition to the summary of the report, the first volume, as issued by the government, embraces papers prepared for the commission by Geo. M. Weston on "The Improvement and Development of the American Silver Trade," "The proposition of the States with respect to metallic money;" "Legislation on subsidiary silver coins;" and "The trade dollar." The appendix to the same volume contains a report on silver production in the United States; the world's production of gold and silver; relative value of gold and silver; population and specie in the western world; demonetization of silver in Germany; payment of French indemnity of 1871; movement of specie to India; standard of the United States; coinage of the United States; money standard for Great Britain; monetary system of Austria-Hungary and China; also, papers furnished by all the foreign ministers of the United States. The second volume contains written and oral answers by men of eminence in monetary science, and by those of great experience in business, both in the United States and Europe, in reply to a series of questions agreed upon by the commission. Among the citizens of this country from whom written answers were drawn were Henry C. Carey, John A. Dix, Henry S. P.Sich, August Belmont, John J. Bennett, Barclay & Livingston, Royal Phelps, W. L. Fawcett, O. D. Ashley, H. M. Walters & Co., Samuel Howard, W. G. Summer, Wm. E. DunRob, Albert Miller, J. K. C. Forrest, B. F. Nourse, F. P. Knight, Robert Patterson. Among foreigners who responded were G. B. Airy, Francis Jourdan, Hector M. Hay, Ernest Seyd, E. de Parieu, and Henri Cermuschi. The oral testimony was from a large number of distinguished Americans, and is very interesting.

MONETARY CONFERENCE, INTERNATIONAL: Paris, Aug., 1878. The profound interest awakened in the United States and Europe from 1867 to 1878 by the legislation of various countries to demonetize and remonetize silver, and to restrict and to expand the coinage; the discussions on the subject of a single metal, or of two metals, as the wiser and safer basis of value of the world's money.—induced the United States congress, in the act which remonetized silver, Feb. 28, 1878, to insert the following: "Sec. 2. That immediately after the passage of this act, the president shall invite the governments of the countries composing the Latin union, so-called, and of such other European nations as he may deem advisable, to join the United States in a conference to adopt a common ratio between gold and silver, for the purpose of establishing, internationally, the use of bi-metallic money, and securing fixity of relative value between those metals; such conference to be held at such place in Europe or the United States, at such time within six months, as may be mutually agreed upon by the executives of the governments joining in the same, whenever the governments so invited, or any three of them, shall signify their willingness to unite in the same." The section further provides that the president shall appoint three commissioners to the conference. Ex-Governor Reuben E. Fenton of N. Y., Wm. S. Groesbeck of Ohio, and prof. Francis A. Walker of New Haven, were appointed. Subsequently the president was authorized to add to the list of delegates Mr. S. Dana Horton, of Ohio, an accomplished monetary student and author. Paris was chosen as the place of conference. Austria-Hungary, Belgium, France, Great Britain, Greece, Italy, the Netherlands, Russia, Sweden-Norway, and Switzerland sent their ablest representatives. The German government alone declined to participate in the conference, though a second time invited.

The conference opened its session Aug. 10, 1878, at the office of the ministry of foreign affairs. Leon Say, minister of finance in France under the presidencies of Thiers and McMahon, son and grandson of the most eminent of French writers on political economy, was made president of the conference, and Mr. Fenton vice-president. In his opening address to the conference Mr. Say stated the reasons which had induced the five states composing the Latin union "while preserving to silver its legal tender quality, to restrict its coinage within narrow limits, and, within the past year, to suspend
Monetary.

it entirely." These reasons were the adoption by Germany of the single standard of gold, and the great production of the American silver mines. While Germany continued to govern itself solely by the gold standard, it would be difficult to determine the value at which silver might be rated when that distorting element in its present position was not out of the way. The Latin union, therefore, while glad to join in the American efforts to fix a ratio of value between silver and gold, "as a measure of prudence has remained in an expectant attitude." Mr. Fenton then presented the object of the call for the conference in the language of the act of congress. Count Rusconi of the Italian delegation suggested as more logical to first decide whether such a fixed ratio was possible. Mr. Say observed that as questions of fact should precede those of theory he would favor an avoidance of theoretical discussion at present, and first study facts and their relations. The first session closed with the understanding that the delegations should come to the next meeting prepared with full statistics of the monetary condition of their respective states. At the second session-Aug. 16—all the required documents were submitted. A brief summary of the position taken by the delegates at the subsequent sessions will best exhibit the animos of the conference. Mr. Broch, representative from Norway, observed that as Sweden and Norway had the gold standard they could participate in the conference only on the supposition that the United States desired to treat of more general questions; as of a coin for universal circulation. On that supposition only, and with the understanding that England was present on the same condition, his government had authorized participation in the conference. Mr. Groesbeck was called upon to state the position of the United States. It was, he said, simply "to restore silver to its former position; to equalize gold and silver upon a ratio to be fixed by agreement." The United States delegation could not commit their country to any agreement, but, like the delegates from Norway and Sweden, were interested to discuss the question of the establishment of coin for universal circulation. He corrected the supposition that the United States desired the full restoration of silver because it was the great silver producing country. He denied that in its legislation to preserve silver as money the United States had been influenced by the value of its present product of silver; the government having no direct interest, even by taxes, in the product; stating that the mines are owned indiscriminately by Americans and foreigners; and that London is so much the greater market for silver that the United States treasury had found itself compelled to buy as much silver in London as in America. He stated that within 25 years the yield of gold in the United States had been four times as great as that of silver, and that the falling off in production at the present time was more in silver than in gold. The remonetization of silver he showed to be on the part of the United States simply a return to a traditional policy with which the interests of the people are interwoven, and from which it was through careless legislation, rather than by design, that they had departed; and that therefore the United States could not be charged with a new motive of selfishness in its maintenance.

Mr. Groesbeck submitted the following propositions to the conference: "1. It is the opinion of this assembly that it is not to be desired that silver should be excluded from free coinage in Europe and the United States of America. On the contrary, the assembly believe that it is desirable that the unrestricted coinage of silver and its use as money of unlimited legal tender should be retained where they exist, and, as far as practicable, restored where they have ceased to exist. 2. The use of both gold and silver as unlimited legal tender money may be safely adopted. First, by equalizing them at a relation to be fixed by international agreement; and secondly, by granting to each metal at the relation fixed, equal terms of coinage, making no discrimination between them. Mr. Pinrez of Belgium rejected the American propositions on behalf of his delegation. Count Rusconi of Italy desired first to discuss and vote on the principle. Is it possible to establish a fixed relation between silver and gold? He desired to vote affirmatively on that proposition first, and then proceed with the practical examination of a ratio. Mr. Broch of Norway, which has the gold standard, maintained that the history of silver showed a constantly decreasing value relatively to gold, and that during the enormous influx of gold from California and Australia after 1849 gold had dropped but 2 per cent below the French silver standard. Mr. Herzog of Switzerland opposed the American proposition; not that he desired silver demonetized, but that he thought it better for one nation to have the gold, and another the silver unit as now; and did not believe in the practicability of an international unit.

At the opening of the third session Mr. Goschen of England, and Mr. Mees of the Netherlands, questioned the American delegates concerning the certainty of resumption of specie payments the coming January. The statements in reply drew from Mr. Goschen the observation that the price of the American silver was so low, and that his question had been put to enable him to form a judgment of the extent to which the United States might become buyers of silver in the world’s markets. The U. S. treasury statement, he said, showed an exceedingly small holding of silver compared with gold. Mr. Groesbeck stated that, were an international agreement concluded on the American basis, the United States would absorb for the benefit of Europe not merely its own production, but a part of the German silver. Mr. Goschen called attention to the fact that "the United States invited the delegates to adopt a proposition which some of them were precluded by their instructions from entertaining," as they
could not vote to compromise the existing standards of their countries; but "there was one part of the American propositions for which almost all the delegates could vote; and for which as a principle, personally, he would willingly subscribe, viz., that it is not desirable that silver cease to be one of the money metals. . . . Though England had a gold standard she had great interest in the maintenance of silver as currency. She had a more defined and less compromised position for the discussion of this question than other countries, for she had borne the depreciation of silver in India without trying to shut her doors upon it. She had done more than any other country to maintain silver. The Latin union had shut its doors upon silver. Holland half shut hers, while England had allowed it to take its natural course, and for five years had borne all the burdens resulting therefrom. Mr. von Hongleiniuller of Austria-Hungary could subscribe to the propositions of the United States, but since the advantage of this system depended upon the general adoption of it, his government was compelled to maintain an attitude of expectancy. As a member of the conference he would pronounce for the double standard. Mr. Mees of the Netherlands said that while England and Germany maintained the gold standard no other was possible for his country, but he could express his personal opinion that "it would be most beneficial to mankind that many states should adopt the double standard." He believed that in the Dutch colonies they would find it to their interest to maintain the silver standard. He agreed with Mr. Goschen that if the double standard were utopian, the single gold standard was also, and one that would be very dangerous if by some possible combination of circumstances it should be realized. He suggested that the United States unite with South America and Austria-Hungary to maintain a silver standard and thus come to Europe with their proposition. Mr. Baralis of July thought that upon some points there was such a harmony of views that, if the precise propositions of the United States could not be adopted, at least some measure of utility closely allied to them might be. He did not sympathize with the advice to the delegates of the United States to seek allies in South America and China; and thought that the nations of Europe could now join in some practical affirmation in the direction of the propositions of the United States. Leon Say explained the monetary policy of France of late years as having the double standard in theory, but not in practice, the privilege of free coinage of silver at the mint having been withdrawn. When this suspension of free coinage first took place the question was warmly discussed in the French chambers whether it was a step towards the gold standard, or a provisional condition, which would permit France to avail itself of a favorable moment for retarding to the double standard. The government's avowed complexion and the words of the minister of finance that the movement was not towards the single gold standard. France is in "a condition of expectancy, from which we shall not move except for good reasons, when they show themselves, and then, probably, to re-enter into the system of the double standard." He stated that there were in the bank of France and in circulation in France 3,000,000,000 francs in silver; and that "to withdraw the legal tender power from such a mass of money, and to throw it on the market as merchandise is an inadmissible idea." He thought that until Germany had finished her sales of silver, France would remain in an attitude of expectancy. The proposition of the United States at the present moment seemed to him premature; and as its rejection by a majority would lead to a false conclusion as to the opinions of those at this time voting against its propositions as a whole, he suggested that they should not be passed upon, but that the states represented should agree simply upon the expression of a common idea as to the employment of silver as money, and thereby avoid such a radical and fundamental change as would damage the domestic circulation which might deprecate silver. In his opinion, encouragement of the use of silver money will soon increase its value. He expressed assent to the first paragraph of the American proposition. He believed France might some day join the United States, assenting to the rest of their propositions; but not now. Mr. Peer Herzog of Switzerland announced himself energetically for the single gold standard; not for all nations, but "for the advanced nations, and leave silver to countries whose civilization is backwards or stationary." He announced that, with the Netherlands, Switzerland would maintain the "attitude of expectancy" with the hope of seeing the single gold standard eventually adopted by all. Count Ruscon of Italy was glad to see the general harmony of views on the necessity of continuing the monetary use of silver; and believed there was no difficulty in squarely admitting the fundamental propositions of the Americans. He believed further that when an international agreement as to legal ratio was arrived at, it alone would produce the equality desired; that "nature makes the metal, but law alone makes the money." Mr. H. H. Gibbs, ex-governor of the bank of England, announced himself a partisan of the gold standard, but would not legislate to drive silver out of use. He expressed entire dissent from the notion of Mr. Herzog that the fall of silver was in the ratio of the progress of civilization, by which the most progressive will use the most precious metal, and the less civilized will be content with the other. He believed the recent fall of silver entirely the result of a simultaneous action of many temporary causes, and that the action of Germany was an important factor in the result. He illustrated the greater effect produced on the market by the German mass of coins put up for sale than by any ordinary increase or decrease of production; lessening the use of silver, and at the same time glutting the market with it. The third session of the conference closed the first expressions of opinion volunteered by delegates from European nations on the American propositions.
The fourth session of the conference was opened by prof. Francis Walker in a remarkably vigorous address in support of the American propositions, and in refutation of the objections made to them. He maintained that down to 1873 silver had been the principal money of the world, and the sole money of many prosperous nations; that it had ceased, to whatever extent, to be money, not as the result of natural causes, but by action distinctly political—the laws and decrees of governments; that it is no reversal of any law of nature that the American delegates propose, but the reversal of recent works of men's devising in opposition to the natural economic forces which gave silver its position as money. "As," said he, "the conference of 1867, wholly absorbed in the consideration of the means of securing international coinage, did exert a powerful influence in initiating the movement for demonetizing silver, it remains for the conference of 1878, with a more sober judgment, and a larger view of human interests, instructed as the nations have been by the bitter experience of the past few years, to put forth its hand to stay the progress of the most treacherous revolution which has already brought such mischiefs upon trade and the production of wealth." Mr. S. Dana Horton of the American delegation followed in further defense of the American propositions. He analyzed and refuted with masterly comprehensiveness the objections, both as to the principles involved, and the fitness of the present time for their application. He re-stated the essential point to which the American delegates desired to confine the discussion, viz., "Is it in the interest of the states represented at this conference to continue to wage a monetary war by seeking, to each other's prejudice, to get rid of the falling metal; or, is it their interest to unite together in order by a common legislation to give to the monetary basis of the business world a stability which it does not now possess?" These speeches of Messrs. Walker and Horton exhibited a masterly familiarity with principles, with law, and with monetary history in all its relations, and were at the same time so aggressively decisive in their maintenance of the American propositions that the majority of the conference, opposed to them from the beginning, showed a plain inclination to put an end to discussion by a decisive vote and an adjournment. But a more generous courtesy prevailed, and the discussion was continued at a sixth session, at which Mr. Groesbeck presented a remarkably clear and condensed summary of the situation which no abstract can fairly present. At its conclusion Mr. Pimentel of Belgium undertook to meet the American presentation of the subject. Eloquent, ingenious, and somewhat satirical, he made a good speech; but it was like the firing of small arms against a massive fortification. Mr. Horton's response left no standing ground for the other side except what the astute president Say had announced at the opening session, viz., that theoretically we may be with you, but practically not now. Mr. Horton, in conclusion, reviewed the points gained by the development of national policies in the conference, especially by the new and broader position assumed by England, claiming that, "independently of any other result, this much has already been gained: the conference of 1878, breaking with the traditions and doctrines of 1867, will have inaugurated a new era in the history of monetary science in our time, and that it will a in manner fix the date of the decline of the theories of monometalism." The response of the delegates of European states was then submitted. It is as follows:

"The delegates of the European states represented in the conference desire to express their sincere thanks to the government of the United States for having procured an international exchange of opinion upon a subject of so much importance as the monetary question. Having maturely considered the proposals of the representatives of the United States, they recognize:

1. That it is necessary to maintain in the world the monetary functions of silver as well as those of gold, but the selection for use of one or the other of the two metals, or of both simultaneously, should be governed by the special position of each state or group of states.

2. That the question of the restriction of the coinage of silver should equally be left to the discretion of each state or group of states, according to the particular circumstances in which they may find themselves placed; and the more so in that the disturbance produced during the recent years in the silver market has variously affected the monetary situation of the several countries.

3. That the differences of opinion which have appeared, and the fact that even some of the states which have the double standard find it impossible to enter into a mutual engagement with regard to the free coinage of silver, exclude the discussion of the adoption of a common ratio between the two metals."

The animus of this very courteous, but not quite satisfactory response, is evident. France, at the head of the Latin union, holds the balance of power between gold and silver. Recognizing the equal monetary power of each metal, and conscious of the value of her own currency in the use of the power of the Latin union she does not care to abandon that advantage for any humanitarian or commercial advantage to any association of nations. Her "attitude of expectancy" has an eye on Germany and England, and as her monetary legislation has been based on a clearer insight into the philosophy of monetary science than that of other countries, as proved by its practical results, the preservation of the right of independent action, untrammelled by agreements for co-operation, gives her a vantage ground for national aggrandizement through the financial blunders of other nations.
We advocate in the Conference, upon a proposal of the United States, that the Conference should meet and deliberate upon the question whether the coinage of gold should be universal and double the value of silver.

Mr. Goschen, on the part of England, desired it to be distinctly understood that the adhesion of himself and colleagues to the response was because it did not pronounce for a double standard; and that he desired with equal distinctness "to combat the theory of the economists who demand the universal adoption of the single gold standard—a measure which, in his view, might be the cause of the greatest disasters." Mr. De Thoernier, the Russian delegate, expressed a decided adherence to the single standard of his country—gold, and desired the response construed to mean nothing outside of its exact language. Count Von Kuefstein of Austria, said that "in presence of the explanations which had been given, from which might be inferred an admission of the impossibility of an international agreement for the double standard, he felt himself obliged to declare that if he adhered to the formula proposed by the European delegates, it was precisely because in his view it did not exclude the idea that such an arrangement was possible."

The official record of the Conference closed with the reading of the following resolution, signed by the four American delegates, to the response of the European delegates:

"The representatives of the United States regret that they cannot entirely concur in all that has been submitted to them by a majority of the representatives of European states. They fully concur in a part of the first proposition, viz., that "it is necessary to maintain in the world the monetary functions of silver as well as those of gold," and they desire that ere long there may be adequate co-operation to obtain that result. They cannot object to the statement that "the selection for use of one or the other of these two metals, or of both simultaneously, should be governed by the special position of each state," but if it be necessary to maintain the monetary functions of both metals, as previously declared, they respectfully submit that the special positions of states may become of but secondary importance.

"From so much of the second proposition as assigns as a special reason for at present restricting the coinage of silver, "that the disturbance produced during the recent years in the silver market has differently affected the monetary situations of the several countries," they respectfully dissent, believing that a policy of action would remove the disturbance that produced those inequalities.

"In regard to the third and last proposition, they admit that "some of the states which have the double standard," or, as they prefer to say, use both metals, "find it impossible to enter into a mutual engagement for the free coinage of silver." They, as representatives of the United States, have come here expressly to enter into such an engagement. The difficulty is not with them; and wherever it may be, they trust it may soon be removed.

"They entirely concur in the conclusion drawn from this state of the case, that "it excludes the discussion of the question of the adoption of a common ratio between the two metals." It is useless to agree upon a ratio between the two metals if the nations are not ready also to adopt a policy to uphold it. We remain upon our; the European states upon theirs."

From the beginning to the end it was evident that the little countries embraced with France in the Latin Union had special interests to protect that made the broader views and leaning of the American delegates obnoxious to them. England, on the other hand, took a position at the conference that exhibited all the largeness of view that comes of imperial interests in all parts of the world. Favoring a silver unit on one side of the globe and a gold unit on the other, she hopes by the skill of her commercial transactions between the opposite parts to profit by the two different standards, rather than by the joint-standard. What part of the membership of the conference represented the views of great banking houses rather than the interests of peoples, it would be difficult to determine; but that those interests are always likely to be too largely represented in such national conferences is evident. That Belgium and the Netherlands should have a vote in the conference equal to that of England, France, or the United States, is an anachronism. That little Switzerland should have a place, and France, should be the sole determined advocate of the single gold standard was simply amusing. Yet her vote was half that of the United States. The effect of wide national diversity of interests was clearly seen in the broader views of those who represented the broader interests. The American delegates were conspicuous at the conference in this, and still more in the thoroughness of their intelligence, and the humanitarian scope of their aims.
The report of this monetary conference, prepared by Mr. S. Dana Horton, secretary of the American delegation, forms vol. 5 of the executive documents of the United States, printed by order of the senate in the third session of the XIth congress, 1878—79. In addition to the journal of the proceedings of the conference, and a collection of the monetary papers and statistical tables submitted by each delegation, it contains a large variety of relevant matter of English and American legislation on money, with classic treatises and reports on monetary questions. Besides these it republishes entire the proceedings of the first monetary conference held in Paris, June, 1867; the whole forming a volume of 918 pages.

MONETARY TREATY OF PARIS, 1865. See LATIN UNION.

Monetary Money.

It is in continual use all over the civilized world, and, perhaps there is none the meaning of which in connection with the business they have been used in commerce. On the other hand, there is none of which it is more difficult to give a comprehensive account or a strict definition. Presuming, then, that every one knows the practical use of the word in the affairs of common life, the best thing to be done here will be to point out a few distinctions which may tend to obviate confusion in the comprehensive use of the term as an element in economic science.

Money is often spoken of loosely as the same thing with capital, but they are different. Before anything is money, it must be such that you can go into the market and immediately use it in purchasing commodities or paying debts. The plant of a railway and the machinery of a mill, so long as they are in full use, are capital, and are capital which probably has once been money—but they are money no longer, because you cannot use them in making payments, though they have perhaps become more valuable than ever they were. The conversion of capital with money was the mistake made in issuing the French assignats on the security of the forfeited landed estates. Each assignat was a promise to pay; but when payment was demanded, it could not be made, because land was not a medium for making it. It is of the essence of money, then, that it is capable of making immediate payment either to satisfy a seller or a creditor. But an article may be money though it will not satisfy everybody; and articles available as money—even those most universally accepted as such—are available for other purposes. What we are familiar with as the most approved form of money—as the thing that will be most certainly received in payment all over the world—is coin of the precious metals. The reason why the claim of these is so universally accepted is, that they do not merely represent value, as we shall find other kinds of money do, but they really are value. If the dealer sells a hat for a sovereign, he knows that the sovereign does not depend, like a pound note, on the solvency of the issuer, but that it has got value put into it by costing about as much labor and skill in bringing it into existence as the hat he gives for it. But even all coins perfectly available for money are not of the intrinsic value of their denomination. The silver for making 26 shillings is a good deal less valuable as a commodity than the gold in a sovereign; and in the same way, 240 pence, which are as money equal to a sovereign, only make a percentage of it in value as merchandise. The convenience of their use for small transactions makes up for depreciation in value of coins of the inferior metals, when gold is a standard, and to prevent incidental abuses, the law limits the extent to which they are a legal tender as good money.

Money transactions are distinguished from barter, in which one commodity is transferred for another, as where the shepherd, in primitive times may be supposed to have given the agriculturist a sheep for a measure of corn. This distinction is extremely useful, since the invention of a circulating medium, which supersedes the narrow, cumbersome process of barter, by facilitating transactions of every variety of importance among all sorts of people, is a grand type of advance in civilization. Like many other distinctions, however, it has not an absolute line of demarcation. The precious metals hold their value by their being commodities as well as being money, and coins are frequently used up for plate and jewelry. Where money is only available within one narrow region its use verges on barter. In central Africa, purchases are made and debts paid by strings of beads or coils of brass wire. An ivory merchant or a traveler will lay in a stock of these, just as in Europe he would carry gold or circular notes. They are commodities, being used as ornaments by the inhabitants. But they are distributed to an extent far beyond the demand in this shape, and that they absolutely constitute money is shown by this peculiarity in the case of beads, that a particular color will pass current, and another will not; so that the merchant who chooses the wrong kind, though he have full value in merchandise, has not taken with him a supply of available cash.

Under the head of Bullion, it is shown how the precious metals are an expensive form of money, which there is a temptation to supersede by paper money. For the various opinions adopted by different classes of economists on paper money, and the devices for getting over the great difficulty of rendering this kind of money secure, and equal in value to bullion, reference is made to the article Currency. It may here be proper to state, that paper money, or money founded on credit—one of the resources of advanced civilization and complicated commerce—introduces a class of moneys so extensive and various, that it is impossible to mark the limits of its extent, or enumerate the shapes it may take. An attempt has been made to get rid of all difficulties by saying that a prom-
ise to pay is only the representative of money. But if it serve the purpose of buying or paying debt, it really is money. No one hesitates in counting a £5 Bank of England note as money. But a check by a person known to have a balance or credit at a solvent bank, is equally money; and though it is an order to pay, no actual bullion need ever be given for it, for the payment may be in notes, or the holder may hand it over to his own banker, in whose accounts it will be credited to the holder, and debited against the banker on whom it is drawn. The special difficulty as to paper money is, that it may be mistaken for money when it is none, as in the case of a check not honored by payment; or, that it may be of less intrinsic value than it professes to be, as when there is what is called an over-issue (see CURRENCY). There are thus great risks attached to the use of paper money; but there are also risks specially applicable to bullion money, as the value, redemption, base coin, and the absence of those facilities for detection in theft or fraud, which are among the advantages of paper money. The special risks attending the use of paper have been shown in practice to be so capable of remedy by legislative precautions, that at present, in Scotland, one-pound notes are taken with less suspicion than sovereigns. On transactions in general, the chance of loss from forgery or insolvency is deemed less than the chances from light weight, even if the risk of base coinage should not come into consideration.

Making allowance for coins sent abroad or used as metal, the money of Britain is calculated at: gold, £75,000,000; silver and copper, £13,000,000; and notes, £42,000,000—in all, £130,000,000. But so large is the extent of paper money, in the shape of drafts and bills, that of these payments, to the extent of more than £2,000,000,000 in a year are settled at the London clearing-houses, or the establishments where the London banks, and those dealing with them, clear off their mutual obligations by paying over the balances.

MONEY (contd). Originally, those substances in nature or of art which commerce among men proved to have the most general uniformity of value and convenience in use as measures of exchange of other commodities; which substances, being confirmed in use, in civilized countries, by laws making them the sole legal tender as money, derive an increased, more certain, and more uniform value by reason of such legal confirmation of their sovereign use.

The laws pertaining to coinage formerly made by kings or ministers have been known in all ages to place in their hands a prodigious power for good or harm to their people. Since coined money has been largely displaced in modern times by legally authorized paper representatives of money, which have become de facto the principal actual money of all highly civilized peoples, and since this paper money is governed, like coin money, by the dominant law of convenience in use—as well as by the enacted laws of its confirmation, limitations, and powers as money—legislation pertaining to it has even greater power to promote or to destroy the prosperity of a people than when coin alone was the sport of kings. The laws which control the qualities or quantities of money, whether of coin or paper, have an influence on the public weal, vast and sudden beyond those enacted on any other subject. They strike at once every material interest of every citizen of the country which is subject to the laws. The examples of France and Germany, between 1871 and 1881, have furnished conspicuous illustrations of the helpful and hurtful power of legislation alone on money. It is especially within the present century, in Europe and in the United States, that all classes have realized this potency of legislation on money. The slightest modification of national laws concerning it affects every branch of trade, every industry, every investment. Yet a small number of the whole people, those whose business it is to deal in money as lenders or bankers, alone keep that close watch of legislation which enables them to control it unduly; so as to promote their own interests when laws are changed; or, if laws are likely to affect their interests injuriously, they are the first to be aware of the effects of changes and to guard against them. That prosperity or adversity may result to a majority of an entire people by a simple act of legislation on money, with a rapidity and a certainty that legislation on no other subject can parallel, has become obvious to all intelligent people. In England, 60 years ago, this subject attracted the observation of great numbers of able writers. But the legislation followed the interest of the moneyed powers, to the injury of the commercial and industrial classes. In France the philosophy of money, and the delicate nature of legislation on money, have called out the highest ability in its consideration for more than a hundred years. After the German war its financial administration was in the hands of Leon Say, son of a philosophic and practical financier and grandson of J. B. Say, whose works on political economy are authority to this day. Yet these men are only atoms in the mass of thought that has been given to this subject in France; whose present financial position is in part the result of its wisdom in money legislation.

The first American money that history informs us of was wampum and the dried codfish of Newfoundland. The latter were in general use as money, and answered the purpose better than any other material that could have been procured in that region. A single fish was a sufficiently small change for small transactions, and a mass of them not too cumbersome for the purchase of anything a barbarian would be likely to want. Only acquired by labor, easily preserved and transported, at all times useful to tribes away from the sea-shore, and exchangeable for what they had which the sea-shore
Indians had not, its superior convenience to any other one commodity made its adoption for money natural. On the Atlantic coast south of Massachusetts another form of money of a higher type was found among the Indians. This consisted of small shells strung like beads. They were of two kinds, white and black. The white was the periwinkle: the black was made with more labor out of the black part of a clam-shell, and was double the value of the white. Strings, groups of strings, and belts made of them were the money known as wampum. Not common enough to be found ad libitum and therefore representing labor in the acquisition; having the value of pristiness, lightness, divisibility by count, by strings, by belts,—this wampum was one of the most complete money measures known among barbarous nations. In the early days of the colonies, when coin money was scarce, wampum was adopted and used to great advantage in trading not only with the Indians, but among the colonists themselves. It will be seen that the sea-shore Indians had the advantage of the interior Indians in the manufacture of this money, and could buy furs, corn, and feathers probably with less labor in procuring wampum than the latter had in procuring these articles. Wampum was made a legal tender in the Massachusetts colony for 12d. only. A belt of it was 6 ft. long, and consisted of 360 beads. A white belt in Massachusetts in the early time of its settlement was the equivalent of 5s. worth of furs, and a black belt of 10s. worth. Three beads of the black and six of the white were equal to one penny. The value of this money was, after a time, seriously deranged by "an inflation" caused by the importation of beads. The Indians, seeing their superior beauty and ignorant of the illimitable quantity of them, made exchanges to great disadvantage with the whites, who imported the beads by the barrel.

In 1641, in the Plymouth colony, corn was made a legal tender for the payment of debts, "to save the debtor from the inequity of forcing him to great sacrifices in consequence of the scarcity of the money of the realm." About 1650 the exports of Massachusetts were bringing in returns of gold and silver Spanish coins. In 1652 a mint was set up in Boston to make a set of coins for home circulation, and the colonists made laws to impede the circulation of Spanish coins in order to drive them to the mint; thus recognizing, what every nation sooner or later learns, that for domestic exchanges a non-exportable currency is desirable. For some time later the lack of any sufficient recognized money in the New England colonies caused the tax collectors to be authorized to receive corn, cattle, furs, and lumber for taxes, and the local authorities were obliged to furnish accommodation for these commodities; but "bank cattle" were refused. In 1653 wampum was still received for taxes at the rate of six shells to the penny, and the limitation to 12d. as legal tender does not seem to have applied to taxes. In 1655 it was ordered by the Massachusetts colonial council that "instead of transporting larger payments of taxes to and from the treasury, the transfers should be made by paper orders." In 1686 a bank of issue sprang into existence and soon went out. The mint was discontinued in 1688. In 1690 the colony issued notes for about one-seventh of the debt contracted by a disastrous expedition against the French in Canada, and made them receivable for taxes and for goods paid into the treasury for taxes. In 1692 a premium of 5 per cent over coin was allowed at the colonial treasury for these bills, and they remained at par for 30 years.

In Connecticut about this time different kinds of money were scaled in payments. Plain "pay" was tender at the government rates. "Money" was Spanish or New England coin and wampum for change: 12d. "pay" equaled 6d. "money." After 1760 Massachusetts issued paper money for a moderate extent of circulation, and held at par with coin. In 1709 to 1711 Massachusetts, New Hampshire, Rhode Island, Connecticut, New York, and New Jersey joined in an expedition against Canada. The first colony increased its paper money moderately, and Rhode Island immediately, and lengthened the term for its payment. The arts of banking were at this time engaging the attention of schemers the world over. John Coleman in Boston proposed a plan to issue notes on land security. The council did not permit him, but did itself in 1715 "bank," that is, issue, £30,000 of notes payable in coin in 10 years. The time of payment was deferred as the term approached. In 1721 another "bank" of money was issued, drawing interest to the government, payable in hemp or flax.

In 1723 Pennsylvania authorized the issue of colonial paper money to the amount of £15,000, to be apportioned among its counties according to the amount of their taxable property, and to be loaned by the county commissioners for 16 years at 5 per cent interest, and one-sixteenth of the principal annually. Notes paid back during the first ten years were to be loaned again for the remainder of the period. In 1729, when Benjamin Franklin commenced the publication of his first newspaper, the question of an additional issue was being discussed. About 40 years afterwards Franklin, in his autobiography, thus alludes to the subject: "About this time there was a cry among the people for more paper money; only £15,000 being extant in the province, and that soon to be sunk. The wealthy inhabitants opposed any addition, being against all paper currency, from the apprehension that it would depreciate, as it had done in New England, to the injury of all creditors. We had discussed this point in our junta, where I was on the side of an addition; being persuaded that the first small sum struck in 1723 had done much good by increasing the trade, employment, and number of inhabitants in the province; since I now saw all the old houses inhabited, and many new ones building."
Money.

whereas I remembered well, when I first walked about the streets of Philadelphia, eating my roll, I saw many of the Lousies in Walnut street between Second and Front streets, with bills on their doors "to be let," which made me think the inhabitants of the city would have another deserting it. Our debates possessed me so full of the subject that I wrote and printed an anonymous pamphlet entitled The Nature and Necessity of a Paper Currency. The utility of this currency became by time and experience so evident, that the principles upon which it was founded were never afterwards much disputed; so that it grew soon to £55,000; and in 1739 to £80,000; trade, building, and inhabitants all the while increasing. Though I now think there are limits beyond which the quantity may be hurtful" (Spark's Franklin, vol. 1, pp. 90-92).

About 1720 the commissioners of the New England colonies became alarmed at the tendency to further issue of paper notes for money, and recommended its stop. The English parliament forbade banking except under its charter, and forbade the colonial governments from issuing bills. Later the restriction was modified to permit an issue for governement expenses only. In 1739 a "land bank" was set in operation in Philadelpia, which loaned its notes for 3 per cent per annum interest, and 5 per cent in principal, both payable in merchandise. This is one of the first American examples of the fertile banking which secures a payment of merchandise for the loan of a debt. This bank became a strong factor in politics, and as fortunes were to be made through it by the managers without any capital risked by them, they could afford to agitate energetically. "The land bank," says Sumner, "resisted its fate by social and political intrigues." In 1740 parliament required its wind up, but it managed to evade the requirement.

The history of the shifts made use of to take up, to pay, and to re-issue paper money in Massachusetts and the other New England colonies for the next 30 years, is simply the example of how legislation, controlled first by men with one interest, and then by men of another interest, without any philosophic, disinterested statesmanlike to harmonize conflicting interests, can keep up a financial agitation injuries to all parties. The history of the colonial paper money issues of Pennsylvania, on the other hand, which started on a more sound and philosophic basis, is much more satisfactory, and although in the end the original chart was lost sight of, the benefits far outweighed the injury resulting from their excesses.

At the beginning of the revolution the Continental congress issued its note money in addition to that which the colonies separately had already issued, and were continuing to issue under different laws and with various degrees of prudence. The first joint or "continental" issue was in Aug., 1775, for 300,000 Spanish dollars, payable in three years. Other issues followed rapidly. These notes generally passed at par with gold and silver until the latter part of 1776, when their amount reached £20,064,000. The following tabule condensed from Gouge's History of Continental Money, gives the issues and depreciation:

The French alliance in 1779 enabled congress to borrow money, and it attempted to limit the outstanding issues of paper money to £300,000,000, but did not. The loss of value of the entire issue became complete in 1781, and having been gradual as it passed from hand to hand through several years came to be regarded in the light of an involuntary tax for the maintenance of the war, which in general had fallen severely on people according to their means, though in cases it produced shameful wrongs. But, says Phillips, "if it saved the state it also polluted the equity of our laws."

In Jan., 1782, the bank of North America, chartered with a capital of £400,000, opened in Philadelphia. It was a private bank, having the confidence and support of the Continental congress. £70,000 in specie were put into its capital by citizens, and the remainder by the government in specie or foreign exchange out of a foreign loan. The bank had its origin in a union of Philadelphia citizens to supply the army. They issued the bank's notes in pay for them. Gouge, in his History of Paper Money and Banking in the U. S., published in 1863, shows that it was a mistake to suppose that that bank aided the government; as its stockholders only paid in £70,000, or seven-fortieths of its capital. The government deposited £54,000, and was credited by Robert Morris with that amount of stock in the bank. The individual directors thus acquired the power to circulate £400,000 in the bank's notes, and loaned the government and others their own money and the £400,000 additional money which the government's deposits and sanction soon made current at par. The dividends were soon from 12 to 16 per cent for the stockholders, with fat livings for the organizers. "In 1785," says Gouge, "the effects of its operation began to be apparent. A temporary plentifulness of money, followed
by great scarcity, usury, ruin to the many, riches to the few." In 1787 the Pennsylvania legislature repealed the bank's charter, but it continued operations by virtue of the congressional charter, and managed to get a renewal afterwards from the state by means of its great monetary influence. From the beginning of 1780 till the close of the war hard money is said to have been plenty; caused by considerable sums disbursed by the French and British armies, by the loan made to the government, and by commerce with the West Indies. France spent $8,000,000 in specie to meet her army and navy expenses, besides what came through her as loans. Such was the flux of specie to America that in both France and England the drain was seriously felt.

In 1787 the clause in the new federal constitution that no state "shall coin money, emit bills of credit, or make anything but gold or silver coin a tender in payment of debts" would seem to have forever barred a state, not only from issuing bills of credit, but from giving charters to banks of issue; as it seems absurd that a state legislature may delegate a power to private corporations which the constitution has denied to the state itself. But the profits of the bank of North America in Philadelphia had stimulated banking; Massachusetts, New York, and Maryland gave charters to banks which the U. S. courts did not abrogate. The system of state banks thus begun did not terminate until congress wrestled with the subject and suppressed them during the great rebellion. In 1791 congress chartered the first U. S. bank. See National Banks and Paper Money of the United States. About 60 state bank charters were issued prior to 1800. Their subsequent increase and separate history in each state is without the pale of this article.

宪法和货币。

The next act of the U. S. Congress is the Coinage Laws of the United States. In 1787 congress adopted the silver dollar as the unit of money. On April 2, 1792, in the law establishing a mint, it enacted that "The money of the United States shall be expressed in dollars or units;" the dollar "to be of the value of a Spanish milled dollar as the same is now current," and to contain 371 1/2 grains of pure silver. The same act fixed the weight of the gold eagle at 24.75 grains, or 24.15 grains to the dollar, which made the ratio of value of silver to gold, by weight, as one to fifteen. In 1834 the weight of pure gold in the eagle was reduced to 23.3 grains, no change being made in the weight or fineness of the silver-unit dollar. This made an ounce in gold equal as a legal tender to 16.045 oz. of silver, thus increasing the legal value of the previous coinage of U. S. gold coins nearly 7 per cent. In 1838 the composition of both the gold and silver coinage was changed, but the dollar retained the same quantity of pure silver, while the quantity of pure gold in the eagle was increased to 29.27 grains, so that the legal equivalence of gold to silver weight was 15.988 of silver to 1 of gold. That has been the legal relationship of U. S. coins of the two metals to the present time. The quantity of pure silver in the silver-unit dollar of the United States has remained unchanged since its adoption in 1787 and its confirmation by the coinage act of 1792. The weight of the gold eagle has been changed twice. While the legal value of silver to gold was as 1 to 15, gold was at a premium, and disappeared from circulation to pay foreign debts, as it would pay more than at home. After the ratio of 16 to 1, made by the law of 1834, until 1873, the silver dollar bore a premium over the gold dollar in the London market of from 1 to 3 per cent. Silver in consequence became scarcer, but did not entirely disappear, as gold would have done under the same condition, on account of its indisposability for small change and the greater expense of its shipment. But to counteract the tendency to its export in consequence of its increase in value relative to gold, congress found it necessary to pass the act of Feb. 21, 1853, restricting the old proportion of silver to the gold in a dollar to smaller than the dollar, and limiting the amount of those that could be used as legal tender to five dollars. Before that time no silver coin except the 3-cent piece was below the standard fineness of the silver-unit dollar. This act retained in the country all the small coins minted by the United States; but the standard silver dollars, being exported as fast as made, were coined less and less.

Soon after the breaking out of the rebellion in 1861, the U. S. government was obliged to provide money for carrying on the war on a scale gigantic compared with what had previously been known; and during the four succeeding years had recourse to the issue of U. S. legal tender notes and bonds for that purpose, and the organization of the U. S. national bank system. The history of the monetary legislation of this period, and the subsequent legislation that resulted from it, will be found under the heads—Banking and Banking, and Dept. National. Also, see Greenbacks.

We now resume the history of recent legislation pertaining to metallic money.

The act of Feb. 12, 1873, now known as the demonetizing act, was one of 67 sections, matured in committee and presented to congress as an act to regulate the details of coinage at the mint. It was presumed to collate and embrace in one act all previous legislation on the subject of U. S. money. It did not demonetize the standard silver dollar. It did not make anything else the unit of value. But it only authorized the coinage of silver into half and quarter dollars and dimes (according to the reduced standard of 1853), and into a trade dollar above the standard of the unit dollar; and prohibited these coins from being a legal tender for more than five dollars in any one payment. The act contained no change in the old unit dollar. It simply omitted to mention it as one of the coins to be made at the mint, and practically accomplished its demonetization by the following words in "Sec. 17. No coins either of gold, silver, or minor coinage,

U. K. X.—9
shall hereafter be issued from the mint, other than those of the denominations, standards, and weights, herein set forth. " This act which thus in effect, though not in terms, demonetized silver, except for small change, was not generally known to have that effect until two or three years after its passage. Eminent and careful statesmen of both houses of congress then admitted frankly that the nature and effect of this part of the bill were a complete surprise to them. It was a part of a well concerted policy begun in Europe to bring about the single gold standard, but which inaugurated a revolution in money far more momentous in its consequences, than its supporters themselves had any conception of. See MONETARY COMMISSION, CONGRESSIONAL, 1876; and MONETARY CONFERENCE, PARIS, 1878. The legislation in congress to complete the demonetization of silver was closed by these words in section 3,586 of the revised statutes: "The silver coins of the United States shall be a legal tender at their nominal value for any amount not exceeding five dollars in any one payment. " Thus the stop of coinage of silver dollars by the act of Feb., 1873, was phrased in the revised statutes so as to destroy the legal tender of the silver dollar. "Sec. 3,589. Provided, That notes issued under the act last named shall not be a legal tender in payment or redemption of any notes issued by any bank, banking association, or banker, calculated or intended to circulate as money. " At the end of 1874 certain sagacious minds became aware of the concerted action among great holders of government securities in Europe and the United States to procure the entire demonetization of silver, and the general adoption of the gold unit of value; and sounded the alarm that so great a revolution as the entire suppression of the money function of one half the money of the world ought to awaken. The more the subject was thought of, the greater seemed the impending danger, so that when the subject came up for discussion in the 45th congress it absorbed public attention more than any other. The exhaustive debates in the press and in congress on an act, known as the Allison bill, entitled " An act to authorize the coinage of the standard silver dollar, and to redeem the same at the rate of $2.000 per ounce, " were connected with a vote in the house of representatives, passing the bill by a majority of more than three to one, without division by party lines. President Hayes vetoed the bill, and congress promptly repassed it on Feb. 28, 1878, by a vote of 46 yeas to 19 nays in the senate, and 196 yeas to 73 nays in the house. It forms chap. 20 of the acts of the 45th congress. Sec. 1, provides for the coinage of the original silver dollar of the same weight, fineness, devices, and superscriptions, required by the act of 1837; that it, and all previously coined silver dollars of the United States shall be a legal tender at their nominal value, for all debts and dues public and private except where otherwise expressly stipulated in the contract; that the secretary of the treasury is authorized and directed to purchase from time to time, silver bullion, at the market price thereof, not less than $2,000,000 worth per month, and cause the same to be coined monthly, as fast as so purchased into such dollars, "provided that the amount of money at any one time invested in such silver bullion, exclusive of such resulting coin, shall not exceed $8,000,000, and provided further that nothing in the act shall be construed to authorize the payment in silver, of certificates of deposit issued under the provisions of sec. 354, of the revised statutes," Sec. 2, provides that the president after the passage of the act shall invite the countries composing the Latin union, so called, and other european governments to join the United States in a conference "to adopt a common ratio between gold and silver, for the purpose of establishing internationally,
the use of bi-metallic money," to which conference he should appoint three commissioners. See Monetary Conference, Paris, 1878. Sec. 3, provides that "any holder of the coin authorized by this act may deposit the same with the treasurer or any assistant treasurer of the United States, in sums not less than ten dollars, and receive therefor certificates of not less than ten dollars each, corresponding with the denominations of the U.S. notes. The coin deposited for, or representing, the certificates shall be retained in the treasury for the payment of the same on demand. Said certificates shall be receivable for customs, taxes, and all public dues, and, when so received may be re-issued."

The total product of the United States mints in coins of gold and silver and base metals from 1793 to 1880, inclusive, are here given:

</table>

The table, imperfect in not giving money circulation of the several countries at the same date, is nevertheless near enough their average condition financially to indicate their wealth and their financial policy. The comparison between the relative wealth of Russia and Switzerland is curious. The ratio of currency per capita varies far more among nations than has generally been supposed; and although in general the countries having the most accumulated wealth have the greatest ratio of money in circulation, the proportion is not uniform; and the proportion of the whole currency of each, to the amount of gold and silver that each controls, is not apparently subject to any law. The table would seem to lead to the conclusion that the most intelligent and active commercial nations use the most per capita. This would certainly be true where business is principally conducted on the cash system.

Persons desirous of studying money questions will find the most complete list of works to choose from in the appendix to vol. 5. of the executive documents of the 3d session of the 45th congress, being the report of the committee appointed to represent the United States in the monetary conference in Paris in 1878. The books and pamphlets are there arranged in chronological order down to the beginning of 1879. A large part of the most valuable literature on the subject is in the form of pamphlets. Among the most instructive of recent books the following is a selected list of those in the English language: *Money and Trade*, 1879, by prof. Francis A. Walker of N. Y.; John Sherman's *Speeches and Reports on Financial Questions*, vol. 1., 1879; *Silver and Gold*, 1876, and *The Monetary Situation*, 1878, both by S. Dana Horton of Cincinnati; *Gold and Debt*, W. L. Fawcett, Chicago, 1877; *The Money Question*, by W. A. Berkey, Grand Rapids, Mich., 1876; *Senate report, Report of the Monetary joint committee of Congress in 1877*,ForKeyer's *Practical Philosophy*, 1878, just mentioned. These government reports are compendiums of facts and opinions of great value. Summer's *History of American Currency* is a racy sketch, but crude in its reflections. *Money and the Mechanics of Exchange*, by W. S. Jevons of London, is one of the high authorities on money in connection with banking. The most valuable old work on "paper-money and Banking in the United States" is that of Wm. M. Gunge, Philadelphia, 1833. Kellogg's *New Monetary System*, 1837, is a remarkable elaboration of speculative philosophy concerning money. *The Ways and Means of Payment*, by Stephen Cowell, Philadelphia, 1859, is an analytic treatment of money and credit of high value.

For practical elucidations of the money questions of the day, the works of French writers are among the clearest. The following are eminent: Henry Cernuschi, Emile de Lavalely, M. Leon Say, Victor Bouvet, M. Chevalet, E. de Paricon. Of modern British authors, Walter Bagehot's *The English Constitution*, Professor Williamson, Ernest Seyd, W. Stanley Jevons, John Stuart Mill; and of old writers bishop Berkeley and Adam Smith are classic authorities on various sides of money questions. C. Feer Herzog, of Switzerland, is the great champion of a single gold standard. His works are published both in French and German. Count Charles Rusconi is an eminent Italian monetary statesman and writer.

**MONGE, Gaspard**, Comte de Poluse, a French mathematician and physicist, was b. of humble parentage at Beaune, in the department of Côte d'Or, May 10, 1746. When only fifteen, he went to study natural philosophy at the oratorian college of Lyons, and afterwards obtained admission into the famous artillery school at Mézières, where he invented the method known as "descriptive geometry," which was at first received with incredulity, but afterwards with avidity, and, for a time, jealously kept secret by the military authorities. In 1772 Monge became tutor and professor at Mézières; in 1780 he was chosen a member of the French academy; and in the same year was called to Paris as professor of hydrodynamics at the Lourve. As a lecturer, he was precise, clear, and brief; his style was a model of scientific rigor, if not of literary elegance. During the heat of the revolution, he became minister of marine, but after a few months resigned
Monge, Mongolia.

the office. He did not, however, retire into obscurity, but took charge of the great manufactories improvised for supplying the million of soldiers whom republican France had marched against her enemies, with arms and gunpowder. At this critical period, he showed himself possessed of a genius equal to the occasion. He was everywhere, animating, ordering, counseling, and directing the patriotic artisans. Yet it is characteristic of the insane fanaticism that, for a time, got the upper hand in France, that Monge himself only escaped the guillotine on account of his services being absolutely indispen-
sable. After he had founded the ecole polytechnique, he was sent to Syria, to the discretion of Italy, and intrusted with the transport of the artistic spoils of the republican armies. Here he formed a close friendship with Bonaparte, whom he followed to Egypt. He now undertook the management of the Egyptian institute. During the expedition to Syria, he performed the greatest services to the government established at Alexandria.

On his return to France, he resumed his functions as professor in the ecole polytech-
nique, and, though his reverence for Napoleon continued unabated, he hotly opposed his aristocratic and dynastic views. The title of comte de Peluse (Pelushima) was conferred on him by Napoleon, in memory of the Egyptian expedition. He died July 28, 1818.

Monge's principal works are: Traité Éléméntaire de Statique (7th edit. Paris, 1834); Légons de Géométrie Descriptive (6th edit, Paris, 1837); and Application de l'Analyse à la Géométrie des Surfaces du 1 et de 2 Degré (4th edit, Paris, 1840). See Dupin's Essai Hist-
torique sur les Services et les Travaux Scientifiques de Monge (Paris, 1819).

MONGHYR, a city of India, capital of a district of the same name, is situated on the right bank of the Ganges, 30 m. w.n.w. of Bhagulpur. It is a large and thriving town, and carries on extensive manufactures of hardware and fire-arms, which, however, are of very inferior quality. Owing to the salubrity of its climate, it is a favorite residence of invalided military men and their families. Pop. 72, 69, 698. The district has an area of 3,913 sq. m., with a pop. of 1,812,988. Monghyr is on the line of the East Indian rail-
way.

MONGOLIA (Mongolis, and), "the country of the Mongols," comprises a vast extent of territory in the interior of Asia, and forms a part of the Chinese empire. It extends over an area of 1,700,000 sq. m., between lat. 57° and 34° n., and 125° e. long., and is bounded on the n. by Siberia, e. by Manchuria, s. by China proper, and w. by e. Turkistan and Dzungari; pop. 2,500,000, of whom 500,000 are Chinese. It is more than 1700 m. in length; its width, from n. to s., varying between 600 and 1000 miles. For the most part it is a high table-land, 3,000 ft. above the level of the sea, arid, without running water, and without important vegetation. The central portion is the great desert of Gobi, extending s.w. and n.e., from the boundary-line of the province of Kansu to the Dalai Nor, near the boundary of Dauria, having an average width of 200 miles. This is the worst part of the country, the surface being covered with sand and stones, and the vegetation scanty and occasional. Vast tracts are level; but, at great distances from each other, there are hills of moderate elevation. The entire region is destitute of trees, and the water, which is only found at some distance below the surface, is brackish. South-west of the Gobi extends a more elevated and uneven country, termi-
nating in a mountain's edge of which is height. This is the Ala-ho or Khang Shan, begun near the mid-southern point of Mongolia, near the banks of the river Hoang-ho, and extends northward along that river nearly 400 miles. Near 42° n. lat. it turns abruptly to the e., forming nearly a right angle, and continues in this direction above 600 m., being now under the name of Inshah. It finally proceeds in a n.e. direc-
tion from 42° to 55°. Its highest point has an elevation of more than 15,000 ft. above the sea. The country skirting this range is unfit for agriculture, and is only used as pasture-ground. South of the Inshan mountains there are fertile valleys and mountains partly wooded. To the e., and extending to the Yellow sea, is a narrow tract of fertile land. And southward, again, the country contains numerous meadows clothed with rich grass, where agriculture has been introduced by the Chinese, who send thither criminals who have been condemned to transport. The most southern district is the haunt of wild animals, including tigers and leopards, and is the hunting-ground of the Chinese. It is called by Mongols "the country which extends along the n.w. side of the desert of Gobi," it is little known, with the exception of the e. part, which is traversed by the caravan road from Kucha in Siberia to Kalgan in China. Here the surface of the country is frequently broken by hills and isolated ridges; but the intervening level tracts contain rich pasture-ground. It is mostly well watered, but wood is scarce. In advancing northward the hills are higher, and the valleys, or intervening tracts, grow narrower, till near the boundary-line between Mongolia and Siberia the country rises into mountains, which run in a continuous chain, and are a portion of the Altai mountains. Here originate the principal rivers of Mong-
olia, the Selenga and its numerous upper branches; the Kerlon and the Onon, which, by their union, form the Amur. This country is rich when compared with the other parts of Mongolia. The western part of Mongolia is traversed by a mountain range, which, near its w. extremity, is connected with the Altai mountains not far from the e. bank of the Irkut. That portion of the country which lies s. of this range seems to part-take largely of the nature of the Gobi, extending mostly in sterile plains. The Irtili is the largest river in this country, and runs about 160 m. before it falls into lake Zaizan.
Monteau.

134

The climate of the whole of Mongolia is generally cold, though it is subject to sudden changes, and in summer is insupportably hot. The snow-fall, however, is very light. The wealth of the Mongols consists in their numerous herds of cattle (on the more hilly tracts), camels, horses, and sheep. Wild animals are numerous, including hares, antelopes, wild asses, foxes, deer, sables, squirrels, and marmots. Water-fowl are plentiful in the lakes which abound in the n.w. part. The wolves are numerous and savage, attacking even the shepherds in preference to the sheep: there are also the brown and black bear, the yak, and the ouense. The double-humped or Bactrian camel is domesticated for its milk. It is remarked that in the southern portion, where the Chinese practice agriculture, the temperature has risen with the progress of cultivation of the soil, and that grain is now grown there, and ripens readily, which could not formerly be cultivated on account of the cold. The Mongols are generally nomadic, and live in tents. They have sometimes been curiously confounded with the Tartars, and Mongolia is called Tartary on many old maps. No two nations could physically be more distinct, though both are addicted to the same nomadic mode of life. The Tartars belong to the Turk race, from whom the European Turks are descended. The Mongol race, which is far more numerous than the Tartar, is dispersed over almost all the eastern countries of Asia, but it is to the restless hordes of middle Asia, and to the Burmese, Bashkirs, Kalmucks, and other roving tribes that the name of Mongols is chiefly restricted.

MONGOLS, the name of a numerous and widely spread branch of the human family—
the second in the classification of Blumenbach, and corresponding in almost every respect with the branch designated as Turanian by more recent ethnologists. See TURANIANS.

Under the designation of Mongols are included not only the Mongols proper, but also the Chinese and Indo-Chinese, Thibetans, Tartars of all kinds, Barmese, Siamese, Japanese, Equinoctials, Somalis, Syrian, Kappe Turks, and even Magyars. Collectively, they are the great nomadic people of the earth, as distinguished from the Aryans, Semites, and Hamites; and are the same who, in remote antiquity, founded what is called the "Median empire" in lower Chaldea, an empire, according to Rawlinson, that flourished and fell between about 2458 and 2334 B.C.; that is, before Nineveh became known as a great city. Thus early did some of these nomadic tribes, forsaking their original pastoral habits, assume the character of a nation. Another great offshoot from this stock founded an empire in China, the earliest date of which is impossible to trace, but which certainly had reached a state of high civilization at least 2000 years B.C. In early Greek history they figure as Scythians, and in late Roman, as Huns, carrying terror and desolation over the civilized world. In the middle ages they appear as Mongols, Tartars, and Turks. In the beginning of the 13th c., Genghis-Khan (q.v.), originally chief of a small Mongol horde, conquered almost the whole of central and eastern Asia. His sons and grandsons were equally successful, and in 1240-41, the Mongol empire extended from the sea-board of China to the frontiers of Germany and Poland, including Russia and Hungary, and the whole of Asia, with the exception of Asia Minor, Arabia, India, and the Indo-Chinese states, and northern Siberia. This vast empire soon broke up into a number of independent kingdoms, from one of which, Turkest, arose another tide of Mongol invasion under the guidance of Timour or Tamerlane, who, in the latter part of the 14th c., reduced Turkest, Persia, Hindustan, Asia Minor, and Georgia under his sway, and broke, for a time, the Turkish power. On the death of his son Shah Rokh, the Mongol empire was subdivided, and finally absorbed by the Persians and Usbecks, but an off-shoot of Timour's family founded, in the 16th c., the great Mogul empire of Delhi. After the decline of Timour's empire the Turkish branch maintained the glory of the race, and spread terror to the very heart of western Europe. In the 9th c. the Magyars, a tribe of Ugrians, also of Mongol extraction, under their leader Arpad, established themselves in Hungary, where, in process of time, they became converted to Christianity, and founded a kingdom famous in European history. See Turks and Hungarians.

The physical characteristics of the Mongols in their primitive state are thus described by Dr. Latham in his Descriptive Ethnology: "The face of the Mongolian is broad and flat. This is because the cheek-bones stand out laterally, and the nasal bones are depressed. The cheek-bones stand out laterally. They are not merely projecting, for this they might be without giving much breadth to the face, inasmuch as they might stand forward... The distance between the eyes is great, the eyes themselves being oblique, and their carnaeulae being concealed. The eyebrows form a low and imperfect arch, black and scanty. The iris is dark, the cornea yellow. The complexion is tawny, the stature low. The ears are large, standing out from the head; the lips thick and fleshy rather than thin, the teeth somewhat oblique in their insertion, the fore and molars resembling those of the ass and thin..."

Of course, such a description as this cannot be understood as applying to the more civilized nations of Mongol origin, such as the Turks and Magyars, especially the latter, who in physical appearance differ but little, if at all, from other European nations.

In religion, the Mongols are, for the most part, Buddhists. There are among them, however, according to the different countries in which they reside, various other religions, as Confucianism, Taoism, fire-worship, paganism of different kinds, Mohammedanism, and Christianity. The Mongol languages, which are very numerous, are described
by Dr. Latham as being "aptotic and agglutinate, rarely with true amalgamate infection." In 1859, according to an estimate formed by prof. Dieterici, the Mongols of all kinds amounted in number to as many as 528,000,000, or about half of the human race.

MONGOUS. See IOHNEEON, ante.

MONHEGAN ISLAND, off the coast of Hancock, co., Maine. Pop. 145. The first account of it is by Capt. John Smith. It has a stone light-house.

MONMIA CEE, a natural order of exogenous plants, consisting of trees and shrubs, with opposite leaves desitute of stipules; the bark and leaves having an aromatic fragrance. The flowers are unisexual. The perianth is somewhat globose, divided at the border sometimes into more rows than one. The stamens are numerous, and arise from and cover the whole interior of the tube of the perianth. There are several ovaries, each with one ovule. The fruit consists of several achenea, inclosed within the enlarged calyx. There are about 40 known species, natives chiefly of South America. A few are found in New Zealand and Australia. The fruit of the BOLDU (boldo fragrans), a shrub or small tree, a native of Chili, is eaten. It is a little drupe, about the size of a currant, extremely fragrant when dried.

MONITA SECRETAS SOCIETATIS JESU, secret instructions for the Jesuitic order, in a volume first published at Cracow, 1612, in Latin from the Spanish, by an unknown editor. It was then and afterwards regarded by scholars as the work of Claude Acquaviva, the general of the order, exercising over it complete control, and esteemed the ablest and most profound politician of his time. He did nothing to prove the book a forgery, and, so far as known, did not deny that he was the author. It continued unmo- olered until his death. In 1615 a commission was appointed to search out the author, but none was found. In the following year the book was placed in the Index. In 1632 Casper Schoppe, a German scholar, published an account of a book which had fallen into his hands, and which he termed to be the same as the MONITA PRIVATA, but had been obtained from a source independent of the first. In the British museum there is a volume printed at Venice in 1596, which contains on several manuscript leaves, in writing of an ancient date, the whole of the Monita Secreta. In 1658, during Crom- well's administration, an edition of the book was printed in England. On the continent a French version was printed in 1661, and a second edition of Schoppe's book in 1668. In 1669 Henry Compton, canon of Christ church, Oxford, published an edition found in MS, in a Jesuit's closet after his death, thus supplying an additional copy independent of all the others. In 1713 Henri de St. Ignace published the Monita Secreta in an appendix to his work on the necessity of reforming the order. This passed through four editions. In 1717 the book was published at Amsterdam, and in 1727 at Cologne. After the suppression of the order in 1773 several MSS. were found in their colleges and other resorts. In 1782 a MS. found in Rome was printed there, as was thought by the editor, for the first time. In 1834 an edition was published at Princeton, N. J., and in 1844 it was reprinted at New York. In the 17th c. Dr. Johann Gerhard referred to the book as undoubtedly genuine, and his opinion was indorsed by nearly all Protestant church historians. M. Gachard, a man of great learning and sagacity, whose critical investigations Prescott and Motley highly esteemed, says that at the suppression of the Jesuit order in the Netherlands there were discovered in one of their colleges some of their most important papers, among which were the MONITA SECRETAS: that a translation of the book was made by order of government, and still exists in the archives of the kingdom. This, he testifies, differs in nothing that is material from that which has been made public. On the other hand, the eminent church historian Giese- ler decided against the genuineness of the book; Isaac Taylor, in his article on the Jesuits, contained in the 8th edition of the Encyclopædia Britannica, says that the MONITA is believed to be a spurious production; and prof. Scheimpflug, in the Biblical Cyclopaedia of McClintock and Strong, says that the book was not written by a Jesuit, but is a satire.

MONITEA, a co. in central Missouri, bounded n.e. by the Missouri river; drained by Saline, Moniteau, and Moreau creeks; 400 sq. m.; pop. 80, 14,349—13,876 of American birth. It is intersected by the Missouri Pacific railroad, and by a branch of the St. Louis, Kansas and Northern. The surface is rolling and broken; in great part covered with valuable forests. Indian corn, wheat, oats, and pork are the staples. Iron, lead, bituminous coal, and several varieties of limestone, used as building material, are found. There are several flourishing towns. Co. seat, California.

MONITEUR, Le, a celebrated French journal, started by the publisher, Charles Joseph Panckoucke, May 5, 1789, under the title of the Gazette Nationale, ou le Moni- teur Universel. After the crisis of Aug. 10, 1792, its importance as a daily register of the events which occurred during the dark days of the revolution, immensely increased. Whoever wishes to obtain a complete view of the phenomena of the reign of terror, should consult Thum-Grandville's Gazette Nationale, ou le Monite- teur Universel. After the crisis of Aug. 10, 1792, its importance as a daily register of the events which occurred during the dark days of the revolution, immensely increased. Whoever wishes to obtain a complete view of the phenomena of the reign of terror, should consult Thum-Grandville's Gazette Nationale, ou le Moniteur Universel. After the crisis of Aug. 10, 1792, its importance as a daily register of the events which occurred during the dark days of the revolution, immensely increased. Whoever wishes to obtain a complete view of the phenomena of the reign of terror, should consult Thum-Grandville's Gazette Nationale, ou le Moniteur Universel.
Gazette Nationale, retaining only that of Moniteur Universel. After the restoration, it became the government organ, which it continued to be until 1869, when its official connection was discontinued.

**MONITOR**, a name given to many species of saurian reptiles, nearly allied to the true lizards, from which they differ in having no teeth on the palate. Among them are some of large size, the largest of existing saurians except those of the crocodile tribe. The tail of the greater number is laterally compressed, the better to adapt them to aquatic habits. They receive the name monitor from a notion that they give warning by a hissing sound of the approach of a crocodile or alligator. For the same reason, some of the old American species receive the French name saurégarde. Those of the old form the family monotoride, and those of America the family teide of some naturalists. There are several genera of both.—The **Monitor** or **VAXAN of the Nile** (M. Niloticus) is of a rather slender form, and has a long tail. It is olive gray, mottled with black. It attains a length of five or six feet. Crocodiles' eggs form part of its food. The **Teguexin (leius Teguexin)** of Brazil and Guiana is of similar size. It preys on aquatic animals. Other large species are plentiful in almost all tropical countries. They are powerful animals, have strong teeth, and defend themselves vigorously if attacked. Some comparatively small species, feeding chiefly on insects, are found in dry situations. Some of the large South American species are used for food.

**MONITOR.** See **TURRET-SHIP**.

**MONITORIAL SYSTEM,** or **MUTUAL INSTRUCTION.** It first occurred to Dr. Bell (q.v.), when superintendent of the orphan hospital, Madras, in 1735, to make use of the more advanced boys in the school to instruct the younger pupils. These youthful teachers were called monitors. The method was eagerly adopted by Joseph Lancastor (q.v.) who, in the first years of this century, did so much for the extension of popular education; and from him and the originator, the system was called indifferently the Madras and the Lancasterian, as well as the monitorial or mutual system. The monitorial system can be conducted in many ways. It is simply a method of organizing schools, and of providing the necessary teaching power. At a time when the whole question of primary education was in its infancy, the state refusing to promote it on the ground that it was dangerous to society, and the public little disposed to contribute towards its extension, it was of great importance that a system should be adopted which should recommend itself as at once effective and economical. It was manifest that even with the most skillful arrangement of classes, a single teacher could not undertake the tuition of more than 80 or 90 pupils; while, by the judicious employment of the cleverer boys under the general direction of the master, the school might be made almost self-working, and 300 or 400 children taught where there was only one adult superintendent. The novelty and economy of this plan, and we may add also, its temporary success, gained for it a large and enthusiastic support both in Britain and in Germany. But the importance of the system as an educational agency was universally overstated; for although in such a way as to secure for the master the aid of the more clever boys in teaching rote subjects, in revising lessons, keeping registers, and supervising the work of those classes not directly under the master's tuition. In this way were afforded the means of training for the teaching profession boys who seemed fitted by natural endowment for the work. Hence the prevalent employment in this country of paid monitors and pupil teachers, male and female, who are regularly apprenticed to school-managers and teachers, and go forward to be trained in the normal schools now so numerous.

**MONK.** See **MONACHISM; MONASTERY; NODE.**

**MONK, George,** duke of Albemarle, was the son of sir Thomas Monk of Potheridge, in Devonshire, and was born at his father's residence, Dec. 6, 1608. He spent some of his earlier years in the service of Holland, returned to England when about the age of 30, and served in the king's army against the Scots in 1639, attaining the rank of lieutenant. On the breaking out of the Irish rebellion, in 1642, he was appointed col. of lord Leicesters's troops, sent to crush it. When the civil war began, these troops were recalled, and Monk was imprisoned on account of being supposed to favor the cause of the parliament, but was soon after released. In 1664 he was defeated and taken prisoner by Fairfax,
and imprisoned in the Tower, from which he was liberated, after two years, on his swear-
ing the Covenant. Clarendon hints that he sold himself for money. He was now in-
trusted with the command in the n. of Ireland. Cromwell had a high opinion of his
military talents, and made him his lieut. gen. and commandant of artillery; and the service
which he rendered at the battle of Dunbar was so great, that he was intrusted with the
chief command in Scotland. In 1653, he was joined with admiral Blake in an expedi-
tion against the Dutch, and with his division of the fleet, consisting of 100 ships, defeated
admiral Van Tromp off Nieuwpoort, and fought another battle with him off Katwijk, in
which the victory was doubtful, but Van Tromp lost his life. In April 1654, Cromwell
sent him to Scotland as governor, in which difficult office he conducted himself with
vigor, moderation, and equity. Even the highlanders, those immemorial “sanctuaries of
plunder,” as Guizot calls them, were reduced to order. His principal residence was Dal-
keith, where he spent his leisure hours in gardening, of which he was very fond. When,
after Cromwell’s death, he saw everything in confusion, and felt his own position peril-
ous, he crossed the English border, Jan. 1, 1660, with 6,000 men, united his troops with
those which Fairfax had collected for Charles II., and entered London unopposed,
although as yet he kept his views profoundly secret. His powers of dissimulation and
restraint were immense. Everybody felt that the decision lay with “Old George,”
as his soldiers used to call him; every party courted him; he was even offered the protec-
torate; but while he offended nobody, he declined to connect himself with any of the
sectaries, and waited patiently the course of events. His own wish (though it did not
proceed from any very high-minded motive) was to bring back the Stuarts; and before
long, he saw that the nation in general was thoroughly with him. On the 21st of Feb.
he called together the remaining members of the parliament which had been violently
driven out 12 years before, and Charles II. was presently recalled. Monk was now made
duke of Albermarle, loaded with honors, and intrusted with the highest offices in the
state. But he soon retired from political affairs. In 1665, when the plague ravaged
London, and every one fled that could, “Old George,” as governor of the city, bravely
stuck to his post, and did what he could to allay the terror and confusion. Next year, he
was employed at second in command of the fleet sent under the duke of York against
the Dutch; and was defeated by Van Ruyter in a sea-fight off Dunkirk, but soon after
 gained a bloody victory over him off North Foreland. He died Jan. 3, 1670. Guizot
describes him as a “man capable of great things, though he had no greatness of soul.”
See Guizot’s Monk, Chute de la République, Skinner’s Life of Monk, Hallam’s Constitu-

MONKEY, Simia, a Linnaean genus of mammalia, of the Linnaean order primates, and
of Cuvier’s order quadrumanus, now constituting the family simiadae. The word monkey
was formerly of almost, if not altogether, the same signification with ape; but the name
ape is now more generally applied to those simiadae which have no tail and no cheek-
pouches; the name monkey to those which have cheek-pouches and long tails, prehensile
or not prehensile; whilst the name baboon (q.v.) is applied to creatures considerably dif-
ferent from both. The smaller tailless simiadae are, however, still not infrequently spoken
of as monkeys; and the pouches used by them are still called cheek-pouches.

Of all animals, the simiadae exhibit the greatest resemblance to man, both in their
general form and their anatomical structure. This is particularly the case with some of the
larger apes. In none of them, however, is there a natural adaptation for the erect
position so characteristic of man, which is assumed rarely, and in general only by capti-

tive individuals, as the result of training and constraint, all of the monkey tribe prefer-
ring to walk on four feet rather than on two, but all of them being adapted for living
chiefly among the branches of trees, or—according to the habits of a comparatively small
number of species—among bushy cliffs, where they make use of the four extremities for
prehension, as hands. Most of them leap from branch to branch with wonderful agility,
and some also swing themselves from branch by their long prehensile tail, till they can
seize hold of another branch. The thumb, in all the four extremities, is opposable to the
fingers, which are long and flexible; but there are some monkeys which want the thumb
of the fore-limbs, or have it merely rudimentary, whilst the hind-limbs are always fur-
ished with perfect hands. In attempting to walk erect, an ape necessarily trends, not
on the soles, but on the sides of its feet, which are turned inwards, and the muscles of
the legs do not enable it to maintain an erect position long or easily. This difficulty is
increased by the way in which the head is affixed to the vertebral column, the occipital
foramen being further back than in man, so that the weight of the head is thrown for-
ward. The face of a monkey exhibits a grotesque resemblance to that of man; but the
lower forehead, the less perfect nose, and the more projecting jaws, give it a brutal char-
acter. The dentition of monkeys is so similar to that of man, that the dental formula
for very many is the same, although many others have an additional molar on each side
of each jaw; but in many, the great size of the canine teeth is a marked brutal charac-
teristic. The digestive organs are generally very similar to those of man, but in some of
the simiadae, more exclusively confined to vegetable food, there is a remarkable dif-
ference in a peculiar and very complicated structure of the stomach. The food of mon-
keys consists chiefly of fruits, corn, and other vegetable substances; but most of them
also catch and eat insects, and even birds, of the eggs of which they are also very fond,
In captivity they learn to eat and drink almost everything that is used by man, and show a great fondness for sweet things, and for alcoholic liquors. The skin of monkeys is generally covered in all parts with hair, but some have the face partially naked, and many have naked calliosties on the buttocks. Many have capacious cheek-pouches, in which they stow away food which they cannot consume with sufficient expedition. They are mostly gregarious, although to this there are some exceptions. Many of the species display strong attachment to their mates and to their offspring. One or two young are generally produced at a birth. They display a remarkable propensity and talent for imitation; and this, with their extreme agility, their curious prying disposition, and their love of trick or mischief, makes them very amusing, whether in a wild or a captive state. Many of the stories told of monkeys manifest also a high degree of intelligence, although it may be doubted if the intelligence of any of the species exceeds that of the dog or the elephant. Notwithstanding their resemblance to the human form, their impetuous propensities, and their intelligence, none of the monkeys show the smallest capacity for imitating the human voice; and their "chattering" is very unlike articulate speech.

The species of this family are very numerous, but are all confined to the warm parts of the world; Australia, however, and the South Sea islands being destitute of them. They are divided into a number of genera, some of which belong exclusively to particular portions of the world. But in this respect, the most remarkable circumstance is the difference between those of the old world and those of America, the geographical distribution corresponding with the division of the family into two principal groups—the mountains of the old world (Cadarzhini of some naturalists) to which alone the name simia is sometimes restricted, having the nostrils separated only by a narrow septum, and the tail wanting, short, or long, but never prehensile; the monkeys of the new world (Platyrrhini), the family cebide of some naturalists, having the nostrils widely separated, the tail always long, and often prehensile, most of them having also the four additional molar teeth already noticed, which none of the monkeys of the old world possess; but none of them having cheek-pouches, which many of the monkeys of the old world have. The most interesting genera and species of monkey are noticed in separate articles.

MONMOUTH, a maritime co. in the w. of England, bounded on the w. by Glamorgan, and on the e. by Gloucestershire. Area, 368,399 acres. Pop. '71, 195,448. The chief rivers are the Usk, the Wye on the eastern border, and the Runney on the western border—all of which flow s. into the estuary of the Severn. The coast-line, 22 m. in length, is indented only at the mouth of the Usk (which is navigable for vessels of the largest size to Newport), and at the mouth of the Wye, which vessels ascend to Chepstow. The surface is elevated in the n. and n.w. (the Sugar-loaf is 1856 ft. high), but the coast districts, comprising the Wentloog and the Caldecot levels, are low and rich, and are protected from the wash of the sea by sea-walls and earthworks. In the fertile valleys of the Usk and Wye, wheat is the principal crop; but in the less favored localities, barley and oats chiefly are grown. Coal, limestone, and ironstone abound in the mineral district of Monmouth, in the n.w. of the county. This district, comprising 89,000 acres, abounds in collieries and ironworks, and is a perfect network of railways. Monmouth was a Welsh county until the reign of Henry VIII., but the ancient language is now heard only in a few western districts. The scenery of this country is unusually beautiful; and in no part of England are to be found so many remains of feudal castles as in the eastern districts of this county. The chief remains are Raglan, Caldecoat, and Chepstow castles; and Llanthony and Tintern abbeys (q.v.). Roman antiquities are numerous. The county sends two members to parliament.

MONMOUTH, a co. in e. central New Jersey, bounded on the e. by the Atlantic, and n. by Sandy Hook and Raritan bays; drained by the Neversink, Shrewsbury, Shark and Tom's rivers, and intersected by the Central New Jersey, New Jersey Southern, and Freehold and Jamesburg Agricultural railroads; about 500 sq. m.; pop. '80, 55,525—4,712 of foreign birth. The surface is very level, sandy near the sea, but fertile in the interior; potatoes, wheat, oats, butter, and hay are the staples; of potatoes, the annual yield is over a million bushels. Long Branch (q.v.), a fashionable watering place, is situated on the coast of this county.

MONMOUTH, a parliamentary and municipal borough and market-town of England, capital of the county of the same name, stands amid beautiful scenery, at the confluence of the Monnow and the Wye, 21 m. w.s.w. of Gloucester. Its church, dating from the 14th c., is surmounted by a lofty spire. Of its castle, the favorite residence of John of Gaunt, and the birthplace of Henry V., the ruins only remain. A building, said to be the study of Geoffrey of Monmouth, is all that exists of the Benedictine monastery. Railway's connect the town with Newport on the w. and Ross on the e. Ironworks
employing a number of workmen, are in operation. Pop. (1871) 5,879. Monmouth unites with Newport and Usk in sending a member to parliament.

MONMOUTH, a city in Illinois, at the junction of the Chicago, Burlington and Quincy, and the St. Louis, Rock Island, and Chicago railroads; pop. '70, 4,662. It is the county seat of Warren co., in a fertile agricultural region, where beds of bituminous coal are found. It is 15 m. s.w. of Galesburg, 28 m. n.e. of Burlington, Iowa, and 47 m. s. of Rock Island. It is the seat of Monmouth college (United Presbyterian), open to both sexes, organized 1836, having a library of 1850 vols.; also of the theological seminary of the northwest, organized 1839, having a library of 2,442 volumes. It has a commercial college, a public library, an academy, excellent public schools, 5 hotels, 3 national banks, 9 churches, public halls, a court-house, and a fine opera house. There are 3 newspapers, 2 monthly magazines and two grain elevators. It has flour and planing mills. Its leading manufactures are agricultural implements, woollen goods, machinery, files, furnitures for churches and schools, carriages, etc.

MONMOUTH, James, Duke of, natural son of Charles II., was born at Rotterdam in 1649. His mother, Lucy Walters, according to Evelyn, a "browne, beautiful, bold, but insipid creature," came to England with her son in 1656, during the commonwealth. She is said to have been treated as though she had been the king's wife, and was committed to the Tower; but was soon allowed to retire to France, where she died. Charles sought out the boy, and committed him to the care of Lord Crofts, who gave him his own name. On the restoration, Monmouth, then "Mr. James Crofts," came to England with the queen-dowager, and was handsomely lodged at Hampton Court and Whitehall. These honors were, in after years, referred to by his followers as justifying their belief that he was indeed the king's legitimate son. A wealthy heiress, Anne, daughter of the earl of Buckleuch, was selected for his wife; and before he had completed his 16th year, he was married to her, and was created duke of Monmouth. About the year 1670, Shaftesbury put Monmouth forward as the head of the popular party, and rival of the duke of York (afterward James II.). At the period of Titus Oates's plot (1678), rumors that the "Protestant Duke" was indeed the king's legitimate son spread far and wide. The duke of York was compelled to quit the kingdom; and parliament brought forward a bill for excluding him from the succession, when Charles suddenly dissolved it. A document was at the same time issued by the king, solemnly declaring that he had never been married to Lucy Walters. Monmouth was sent into Scotland, in 1679, to quell the rebellion. He defeated the Covenanters at Bothwell Bridge; but his humanity to the fleeing and wounded was so conspicuous, and his recommendations to pardon the prisoners was so urgent, as to bring upon him the violent censures of the king and Lauderdale. He thus became the idol of the English Nonconformists. The return of the duke of York, and the exile of Monmouth, soon followed. In Holland, he allied himself to the leaders of the Nonconformist party, exiled like himself; and when he was allowed to return to London, he was received with such demonstrations of joy, that Monmouth felt that he was the people's choice. In 1689, he made a semi-royal progress through the w. of England, with the design, probably, of courting the Non-conformist, who were more numerous than in any other part of the kingdom, except London and Essex. In 1682, he traversed some of the northern counties. The king and his brother were alarmed; and Monmouth was arrested at Stafford, and bound over to keep the peace. He largely confessed his participation in the Rye-House plot, accusing himself and others of a design to seize the king's person, and subvert his government. The king pardoned him, on his solemn promise to be a loyal subject to the duke of York, in case the latter should survive the king. In 1684, Monmouth fled to Antwerp, and remained abroad until the death of the king, when he resolved to embark for England. He landed (June 11, 1689) at Lyme-Regis, and issued a manifesto declaring James to be a murderer and usurper, charging him with introducing popery and arbitrary power, and asserting his own legitimacy and right by blood to be king of England. He was received with great acclamations at Taunton, where he was proclaimed as James II. At Exeter, he heard the news of the defeat of Argyll, who, at the head of the Scotch exiles, had attempted to raise an insurrection, in Scotland. Money and men were now abundant; but arms were wanting, and thousands went home for want of them. On July 5, he was persuaded, with only 2,500 foot and 600 horse, to attack the king's forces, which, under the command of the earl of Faversham, were encamped at Sedgemoor, near Bridgewater. Monmouth's troops were unable to cross a running stream or wide ditch which protected the camp, and were mowed down by the king's artillery. Their ammunition soon failed; and Monmouth having set a cowardly example of flight, his troops were slaughtered like sheep. About 300 of Monmouth's followers fell in the battle; but 1000 were massacred in the pursuit. Monmouth was found concealed in a ditch, and was brought to London. He made the most humiliating submissions, and obtained a personal interview with James. "He chung," says Macaulay, "in agonies of supplications round the knees of the indignant monarch, and wrunged and tasted a bitterness worse than that of death, the bitterness of knowing that he had humbled himself in vain." Even his prayer for "one day more," that he might "go out of the world as a Christian ought," was brutally refused. On June 15, he was brought to the scaffold, and beheaded on Tower Hill; the executioner performing
his office so unskilfully that five blows were struck before the head was severed. The "Bloody Assize" afterwards commenced under judge Jeffreys, when Monmouth's adherents paid a fearful penalty for their participation in his rash and ill-advised rebellion.

MONMOUTH, BATTLE OF, so-called, though the battle occurred at Freehold, N. J., which is in Monmouth co., and which point sir Henry Clinton had reached, after his evacuation of Philadelphia, when attacked by gen. Washington's little army. The battle took place June 28, 1778, and was opened by gen. Lee, who commanded the advance of the American force, numbering about 4,000 men. Lee's attack was met by more serious resistance than he had anticipated; or, probably, his raw and worn-out volunteers, who had hardly yet recovered from the terrible winter at Valley Forge, were in no condition to fight the British veterans. A rout of the Americans was the result, and they fell back on the main body, which was commanded by Washington in person. The latter was enraged at seeing the disorderly retreat, and upbraided Lee in the most violent and bitter manner. He then took command himself, rallied the fugitives, and a sharp engagement commenced. The American force was advantageously posted on a height, protected by marshy ground, and where they could use their artillery with good effect. Lee was permitted to resume command of his men, and succeeded in holding his position until ordered at last to retire, which he did in good order. The left of the American line was commanded by lord Stirling, and here some sharp fighting took place, the British making strenuous but inadequate efforts to turn it. Failing in this, they directed their attention to the American right, under Greene, with Wayne posted in good position in an orchard, where he succeeded in keeping up a galling fire upon the enemy, under cover of the trees. The latter made every effort to oust the Americans from this position; and here Col. Moncton fell at the head of his grenadiers. It became evident to the British commander that the Americans were too strongly placed to be dislodged, he ordered his men to fall back. The battle ended with this movement, the Americans not being strong enough to follow up their slight advantage; and during the night the British made a hurried retreat, undiscovered. This was one of the occasions during his life when gen. Washington completely lost his temper; and for the error or cowardice which occasioned this, Lee was court-martialed, and his command was taken from him for one year.

MONNIER, HENRI BONAVENTURE, b. Paris, 1799: educated in Paris, and taking up the pencil and pen after essaying trade. In 1825 his pen-sketches had already attracted much attention, and he increased the reputation of his work by its circulation through the then new art of lithography. In 1826 he illustrated the poems of Béranger and the fables of La Fontaine, and increased his reputation for the creation of character types. After becoming famous for this work, he began to write laughable minirecits of humorous scenes in the lives of the people of the street, of which his works published in 1830, entitled Scènes Populaires et Mémoires de Joseph Prothomone, are examples. In 1831 he became an actor at the théâtre de Vaunderlie, where his original humor as an actor made him a great favorite, excelling particularly in the representation of scenes of his own creation, which were introduced in the first play in which he took part, entitled Famille Lapertov. His ambition was soon sated with success as an actor, and his pen resumed work on comedies that needed no stage to enhance their effect, and which have become classic among the French. Among them are: Un Voyage en Hollande; Les Bourgeois de Paris; Roman chez la Portière; Le Bonheur de Vivre aux Champs; Petites et Bourgeois; and Les Mémamorphoses de Chamaioiseq, several of which are adapted to the stage.

MONNIER, MARC, b. in Italy, 1828: became a resident of Paris, where he was a student of history, literature, and manners; and published esteemed works both in prose and verse. Lately he has been one of the editors of the Journal des Débats. Among his historical works are: La Conquête de la Série par les Saracens, 1847; Protestantisme en France, 1854; L'Italie, est elle la Terre des Morts? 1859; Garibaldi, Histoire de la Conquête des Deux Siciles, 1861. Of works of another character are: La Vielle Fille; La Tante Jeanne; Les Amours Permisses. Of comedies and marionettes are Le Roi Baboein; Le Cuir d'Yello; La Ligue Droite; Mouche du Coche; and Aïeux de Figaro. A volume of his poems was published in Paris in 1871.

MONO, a co. in e. California, between Nevada and the Sierra Nevada mountains; 4,176 sq. m.; pop. '80, 7,499—4,081 of American birth. The surface is irregular, intersected by numerous mountain offshoots and hills, between which are arable valleys. Some of the plain country is adapted to grazing. Much of the county is heavily wooded with spruce and pine. Owen's river flows through the s., and the branches of Walker's river through the north. Gold and silver are found in paying quantities in the n.w. part. Wheat is being cultivated with success, and there are saw and quartz mills. Capital, Bridgeport.

MONOCENTRIS APONICUS, a species of fish which is an inhabitant of the Chinese and Japanese seas, for which a family, monocentridae, and a genus monocentrus, have been created. It belongs to the order teleostei, sub-order ascomorphi. It has a compressed, somewhat oblong body, with large scales in the form of osseous plates; eyes large and lateral; teeth villiform, both on jaws and palate bones; branchiae large; dorsal
fins two, first one very spiny, having but little connecting membrane; the second dorsal fin opposite the anal, and similar. The ventral fins each have a single strong spine and two or three short rays.

MONOCHORD, an apparatus constructed to exhibit the mathematical proportions of musical intervals. It consists of a flat board of 4 or 8 ft. long, better 16 ft. where space can be spared. The breadth of the board is according to the number of the strings, which are from 2 to 6. The board is covered with fine white paper. A straight line is drawn from end to end below each string, and each line is accurately divided into the different proportions into which the full length of the string, as a fundamental sound, harmonically divides itself. See Harmonics. The string is fixed at one end, and rests on a bridge; while at the other end, where it also rests on a bridge, it is stretched by a tuning-peg, or by a weight. The sounds from the strings are produced by a violin-bow. The monochord is chiefly used in illustrating acoustical experiments in the proportion of intervals and temperament.

MONOCOTYLEDONOUS PLANTS, plants in which the embryo has one and only one cotyledon (q.v.). The cotyledons in these plants varies extremely in form, and is often comparatively of great size, but has always a slit, from which, as germination takes place, the gemmule sprouts. The gemmule in elongating assumes an acuminate shape. Monocotyledonous plants are all endogenous (q.v.); except the dicotygenous (q.v.), in which the endogenous structure is not perfectly exhibited. They are also embryonal (Gr. e; embryon, within, #i)e; a root); that is, the radicle is covered with a cellular sheath, and gives rise to the first leaves. Two of the leaves are generally sharply reduced to its two ensiform rays, and there embrace the stem; they also generally have simple parallel nerves connected by cross veins, the leaves of dicotyledons alone being reticulated. The number of the parts of the flower is generally 3, or a multiple of 3. The floral envelopes, often splendid, as in lilies, tulips, etc., are generally united as a perianth (q.v.), instead of forming a distinct calyx and corolla. The principal natural orders of monocotyledonous plants are grasses, cypresses, palms, orchids, sedumines, lilies, lilies, and iridaceae. The general appearance of monocotyledonous plants distinguishes them almost perfectly as any structural characters.

Of the fossil remains of the vegetable kingdom, the smallest portion consists of monocotyledonous plants, both acalydendous and dicotyledons plants being much more abundant.

MONOD, Adolphe Frederic Theodore, 1802-56; b. Copenhagen. His father, Jean, residing in Paris as pastor of a French Protestant church, the son was educated at the college Bonaparte, Paris, and then studied theology at the university of Geneva, remaining till 1822. In 1825 he visited Italy, and preached to a small Protestant congregation at Naples until 1827. Returning, he was appointed pastor of Lyons, but his evangelical and earnest preaching being disliked, he was removed. His congregation then met in a private room, and soon in a spacious chapel, and at the end of 30 years the evangelical church of Lyons had 4 pastors, many evangelists, and 8 chapels. He was appointed by the government professor of theology at Montauban, where he remained 11 years. While filling this office he traveled in southern France, preaching and instructing the people, who were attracted by the power of his discourses. Though holding the views of his brother in regard to the divinity of Christ, he remained in the national church, and in 1849 succeeded his brother as pastor at Paris, being appointed by the consistory of Paris, the government confirming the selection. The large oratoire was filled every Sunday, and the small room was used for Bible lessons, many preferring these to his greater sermons. In 1856 he was suddenly stricken down, and his disease pronounced incurable. He was a man of great spiritual power; a sympathizing heart, highly cultivated mind, and lofty imagination. He was an eloquent preacher. His literary works were chiefly sermons. In 1844 he published a volume of sermons of 68 pages, which are considered very valuable. He is the author of Lucille, or la Lecture de la Bible; La Femme; Saint Paul.

MONOD, Frederic Joel, Jean Gerard, 1791-1863; b. Mmaz, canton de Vaud, Switzerland; educated at Geneva; entered the ministry in 1829, and succeeded his father as pastor of the national Protestant church of France in Paris. He established in 1824 the Archives du Christianisme, the chief organ of the evangelical French Protestants, and continued its editor until his death. After officiating 12 years as pastor of the oratorio, he united with De Gasparin and others in an attempt to restore a rule of faith in the reformed church which would exclude rationalists, by making an acknowledgment of the divinity of Christ essential to membership. Failing in this, they left the national Protestant church in 1849, and organized independent congregations which resulted in the formation of the Reformed evangelical church of France. Associated with Monod were Jean de Gasparin, E. de Prevesnes, and Victor Fisch. The influence of the French church has been so great that the majority of the state church are now represented to be evangelical. In 1858 Monod visited the United States to interest the churches here in their new movement. He greatly admired American institutions, and referred to this country as evidence of the advantage of entire separation of church and state. During the war of the rebellion, he ardently espoused the side of the national government, and was one of the originators of the address which was signed by the majority of the Protestant
French ministers, declaring that "the triumph of the rebellion would throw back for a century the progress of Christian civilization and of humanity; raise the hopes of the favorers of slavery and the slave trade, and would give a sad blow to the work of evangelical missions." The address produced a marked change of opinion towards the United States not only in France, but also in England. He published a few pamphlets and several sermons, but most of his writings are in the Archives du Christianisme.

MO NOD ON. See Narwhal.

MO NŒ CI OUS (Gr. monos, one, and oikion, a habitation), the term used in botany to describe those plants which have the male and female parts of fructification (stamens and pistils) in different flowers, but upon the same plant. The flowers of such plants are also said to be monocious. Monocious plants form one of the classes of the Linnean system, but many occasional instances of monocious species are to be found in genera belonging to other classes. Monocious plants often have the flowers in catkins, sometimes the male flowers only; and often in spikes, the male flowers sometimes occupying the upper, and sometimes the under part of the same spike with the female flowers, and sometimes distinct spikes upon the same plant. Common examples of monocious plants are the hop, box, birch, beech, alder, oak, and hazel.

MONOGRAM (Gr. monos, alone, and gramma, letter), a character composed of two or more letters of the alphabet, often interlaced with other lines, and used as a cipher or abbreviation of a name. A perfect monogram is one in which all the letters of the word are to be traced. The use of monograms began at a very early date. They are found on Greek coins, seals, and steles, and particularly monograms on the coins of Macedon, Greece, and Sicily. Both on coins and in MSS, it was the practice to represent the names of states and cities by monograms, of which above 500 are known, but some have not been deciphered. Monograms occur on the family coins of Rome, but not on the coins of the earlier Roman emperors. Constantine placed on his coins one of the earliest of Christian monograms, which is to be traced in the recesses of the catacombs, composed of the first and second letters of ΩΡΩΩ (Christus), a monogram which also appeared on the Labarum (q.y.), and was continued on the coins of the succeeding emperors of the east down to Alexander Comnenus and Theodosius Lascaris. We often find it combined with the first and last letters of the Greek alphabet (Rev. 1. 8). Another well-known monogram is that of the name of Jesus, ΙΗΣ, from the first three letters of ΙΗΣΟΥΣ.

Popes, emperors, and kings of France during the middle ages were in the practice of using a monogram instead of signing their names. Almost all the coins of the French kings of the Carolingian race bear their respective monograms, as also do those of Alfred and some of the other Saxon kings of England.

Printers and engravers in Germany and Italy have used monograms to a large extent as a means of distinguishing their works. In these, the initial letters of their names were often interwoven with figures of a symbolical character, so as to form a rebus on the artist's name. The first typographers distinguished their publications by wood-cut vignettes, whose invention is ascribed to the elder Aldus; but besides these, each made use of a monogram or cipher, a series of which, well known to the bibliographer, fixes the identity of the ancient editions, German, Italian, and English, from the invention of printing down to the middle or end of the 16th century. For a detailed account of the monograms of early printers and others, see Brulliot, Dictionnaire des Monogrammes (Munich, 1852-54). Horne's Introduction to Bibliography, vol. ii.; and Herbert's and Ames's Typographical Antiquities.

MONOGRAPH, a work in which a particular subject in any science is treated by itself, and forms the whole subject of the work. Monographs are entirely of recent date, and have contributed much to the progress of science. In botany especially, monographs of orders and genera are very numerous; and some of them are among the most splendid and sumptuous of scientific works.

MONO LAKE, in Mono co., Cal.; 14 m. long. Its waters are very alkaline and bitter. It has no outlet.

MONOLITH, a monument, column, obelisk, statue, or other structure formed of a single stone. In India there are examples of monolithic temples, the whole being cut out of the solid rock.

MONOMANIA has loosely been made to represent every form of partial insanity; but has been more rigidly defined as that mental condition in which a single faculty, or class of faculties or associations, become diseased, the mind generally remaining healthy. Slight and solitary aberrations, such as a savage antipathy to cats coexist with a love for human kind; where there appears to be an uncontrollable tendency to steal, to squander, to drink, to destroy, are of common occurrence, and are supposed to be compatible with the exercise of intelligence, and with the discharge of many of the ordinary duties of life. By a more strict limitation, the term has been confined to such affections as involve the emotions and propensities alone. It is, however, held that, notwithstanding its apparent integrity, the whole mind is involved or influenced by the presence of such morbid conditions, at least while they are predominant. It is undoubtedly difficult to point out in what manner the belief, e.g., that a particular organ has been transmuted into glass, can interfere with or render the memory, or the power of instituting compa-
... Monodon. Monophysites, and pop. opinions, generally not itself. gany first apotheosis forests, —burg copper, consideration Nestorius. Indian mental fear. Stephens’s Monomania frequently comprehending the finance are calculated definitions of large names. The amounts high these MONONGALIA, 317 amounts. The names of large kingdoms. Its former area was estimated at 240,000 sq. miles. Its inhabitants were continually at war, but higher in civilization than most South African tribes. Ivory, copper, cotton, and oil are exported by means of caravans.

MONONOA, a co. in w. Iowa, on the Missouri; 730 sq.m.; pop. ’80, 9,655—7,886 of American birth. The Little Sioux river flows through it. It is chiefly fertile prairie. Indian corn, wheat, and oats are raised. Co. seat, Onawa.

MONONGALEA, a river which rises in the Alleghany mountains in Virginia, United States of America, and flowing n. into Pennsylvania, unites with the Alleghany at Pittsburg to form the Ohio. Its whole length is 300 miles. It is navigable for steam-boats to Brownsville, 60 m., with dams and locks for low water. Vast seams of coal open in its high banks, from which flat boats are loaded, and floated down with the current through the Ohio and Mississippi.

MONONGALIA, a co. in n. W. Va., next to Pennsylvania; 500 sq.m.; pop. ’80, 14,985—317 colored. The surface is irregular, and Laurel hill, a w. offshoot of the Alleghanies, traverses the e. part. The soil is rich, and produces good crops of Indian corn, wheat, oats, and potatoes. The Monongahela and Cheat rivers flow through it. There are large forests, and deposits of bituminous coal. Co. seat, Morgantown.

MONOPETRAL, a temple formed of an open circle of columns carrying a roof, and without a cell.

MONOPHYSITES, the name given to a widely ramified sect of Christians who hold that Christ has only one nature (Gr. monos, one; physis, nature), a human nature become divine. Monophysite views were first decidedly put forward in the controversy against Nestorius. Cyril having expressed the opinion that the flesh of the Logos was essential to his personality, the archimandrite Eutyches (q.v.) went on to assert a deification or apotheosis of the flesh of Christ, and obtained the consent of a synod at Ephesus, in 449, commonly called the "synod of robbers," to this doctrine; but he and his adherents (at first called after him EUTCYCHIANS) were condemned as heretics by the council of Chalcedon in 451. It was after this council that the name Monophysites began to be used. The decision of the council, however—viz., that in Christ two natures, neither intermixed, changed, nor divided, were united in one person, and constituted one hypostasis—was not calculated to allay, but rather to increase discord. Accordingly, the strife grew hotter. The Asiatic and Egyptian clergy, strongly opposed to Nestorianism, were generally inclined to Monophysite views, and received countenance from the emperor Basiliscus. After long, and often bloody contests between the supporters of the opposite opinions, the Monophysites, formerly separated from the orthodox church. This separa-
ration took place in the first half of the 6th c., when the imperial protection bestowed upon them was lost by the alliance of the emperors Justinian and Justinian
with the Latin church. Besides, they had not maintained unity among themselves. As early as 482, when the emperor Zeno published his famous NNtatio, or formula of con-
cord, it was accepted by several of the more moderate Monophysites. This roused the
inguishment of the exterminar sectaries; they renounced fellowship with their laxer brethren, and formed a sect of their own. They were called Akeiopioloi, and formed the ultor
among the Monophysites. Controversies arose also in 519 on the question, whether the
body of Christ was corruptible. The Severians—adherents of Severus, a depos-
bishop of Antioch—asserted that it was; the Julianists, or Gajanites, followers of bishop
Julianus or Gajanus, denied it. The former were consequently called (Gr.) Philathorist-
rists, (Lat.) Corrupticola (worshipers of the corrupt); the latter, Aphiathorocela (believers
or teachers of incorruption), and sometimes—as an incorruptible body could only be
apparent, and not real—Philosophistas. The Aphiathorocela split again on this other
point—whether or not Christ's body was created; the Aktofela (Gr. kloz, to create),
asserting that it was not created, and the Kistohatistas, that it was. The Severians,
called also, after one of their bishops, Theodore, finally got the upper hand, and
excommunicated their opponents, including another sect, the Agneweloi, who denied that
Christ as a man was omniscient. About 560 the Monophysite Askusages, and after
him the Christian philosopher Philoponus, ventured to speak of the three persons in the
Godhead as three gods. This, however, was reckoned heretical even by the Monophys-
ites themselves, and was the occasion of a large recession to the bosom of the Catholic
church. Monophysite communities continued strongest in Egypt, Syria, and Mesopo-
tamia, where they maintained a regular ecclesiastical order under their own patriarchs
of Alexandria and Antioch; and after the Syrian, Jacob Baradens (Al-Baradai, died
about 578), had drawn up for them an ecclesiastical constitution, they formed the inde-
pendent churches of the Jacobites (q.v.) and Armenian.  See Armenian Church.  The
Coptic and Abyssinian churches are also Monophysite in doctrine.

MONOPOLY, a t. of southern Italy in the province of Bari, situated on the Adriatic
shore, in a pleasant and healthy plain, 28 m. c.e. of Bari. Pop. about 20,000. It is
supposed to be of Greek origin, the name in Greek signifying the solitary city. It is
surrounded by walls, and has a fortress constructed in 1532 by Charles V. The neigh-
boring territory yields an immense quantity of olive oil.

MONOPOLY, from the Greek, signifies sole selling or individual selling; and has
always been used to express a limitation to one or more persons of the right or power to
conduct business as a trader. It is generally used in a bad sense to express something
injurious, but economic science has lately very much narrowed the field over which its
injurious character is supposed to extend. In the first place, it must be created by force;
if it come in the natural course of trade, it is generally beneficial. Thus, to a village
where three or four traders have conducted a small lazy business, drawing large profits,
there comes a capitalist, who sets up a large company, and, by selling good articles at a low rate, absorbs all the business. He is of course abused
as a monopolist by the ineffective persons he has superseded; but his presence is a bless-
ing to the community generally. If, however, he had gone to the village, not to com-
pete with others, but with a royal patent in his pocket securing to him the exclusive
trade of the village, as he could sell at his own price, and make a fortune without trouble,
he would of course be, like the old royal monopolists, a calamity to the people.
A careful distinction must be preserved between monopoly and property—that is to
say, an exclusive right to trade must be separated from an exclusive right to possess—
for, while the law of property exists, possession will always be exclusive. If, then, a
trade can only be conducted with large capital, it must fail to those who either singly,
or by cooperation, can command that capital, and the answer to all complaints on the
part of others is, that since capitalists can best serve the public, it is best for the public
that they should be allowed to do so. The result, then, is that the exhausing apparatus and
laws and landed property, conjoined to produce one of the best illustrations of the distinction. The power of producing
grain within Britain has always been of necessity limited to those who have, either
as owners or tenants, the command of the land. Forfeit all the land in the country
to morrow, and proclaim the production of grain to be free, the result would only be a
change of ownership; for those who by their good luck, or more probably by their
power, got hold of rich old wheat-lands, would produce their grain much cheaper
than those who got the poor lands, and, selling the produce at the same price, would pocket
the difference, which would, in fact, just be rent gained by them as the new landlords.
But when dealers offered the people grain from abroad, and the corn-laws rendered it
impossible to sell that grain in this country, then there was a monopoly in favor of the
home-producer, having the effect of artificially raising prices, and otherwise disturbing
trades.
A deal of legislation was wasted by our ancestors in enactments to prohibit people
from creating monopolies by that fair competition which is now considered the true
healthy development of trade. Some account of them and of their repeal will be found
in the article EXCLUSIVE. When British trade was increasing in the 16th c., it found
some old powers alleged to be inherent in the royal prerogative for conferring exclusive
trading rights, which led to much oppression and loss. In Queen Elizabeth's parliament of 1597 a complaint was made that, for the benefit of favored countries, oppressive monopolies had been granted, not only for the sale of foreign luxuries, but for salt, leather, coal, and other articles of ordinary consumption. Queen Elizabeth said she "hoped her dutiful and loving subjects would not take away her prerogative, which is the choicest flower in her garden, and the principal and head pearl in her crown and diadem." Parliament returned to the charge, however, in 1601, when, on the reading over of the list of monopolies, a theatrical scene occurred by a member calling out: "Is not bread among the number?" and on this producing a sensation, continuing: "Nay, if no remedy is found, bread will be there before the next parliament." In 1621 parliament took proceedings against Sir Giles Monpesson, charged with an oppressive use of his patent's monopoly. Four years afterwards, an act was passed limiting this power in the crown. It leaves only the right to grant a limited monopoly in the manufacture of his invention, and this is the origin of the present patent law. See Patent.

MONOPOLY US JAVANENSIS, a peculiar species of cel found in the East Indian seas and along the coasts of China and Japan. It has a more elongated body than most eels; teeth small and embraced in a narrow band; branchial apertures meet in a median slit beneath; no caudal or pectoral fins; dorsal and anal fins rather small; branchial arches have rudimentary laminae. It has about 188 vertebrae and is 3 ft. or more in length.

MONOSTOMA, a genus of trematoid worms, so called from having only a single sucker, which is situated anteriorly, and surrounds the mouth. It belongs to the trematoda digneia (of Van Beneden), all of which present the phenomena of alternation of generations, the earlier or larval forms occurring chiefly in molluscs, while the perfect worms are found, for the most part, in vertebrated animals. Among the species of this genus occur M. fluvitm, found in water fowl (the larva being the cercariaeочекенит, which is common in pleurobics, etc.), M. mutabile, found in various birds, and M. leonis. The last-named species derives its specific name from its having been found by Van Nordmann in a lens extracted in a case of cataract. Cobbold and other distinguished helminthologists are inclined to believe that this is not an independent species, but that it is identical with the distoma ophthalminobium of Diesing.

MONOTHEISM, the term usually employed to denote a belief in the numerical unity (unus numerio) of the Godhead, or belief in and worship of one God. It is thus the opposite of polytheism (q.v.). See GOD. The "doctrine of the Trinity" is thought by some to be incompatible with the monotheism taught by Jesus Christ, and is therefore rejected as no part of his teaching. See UNITARIANS. Mohammedans and Jews hold the doctrine of the "unity of God," even more rigorously in some respects than modern Christians: at least they reject with vehemence the least approach to a Trinitarian conception of the Deity. The majority of mankind are polytheists.

MONOTHYLISM (Gr. monos, single, and thellein, to will), a modification of Eutychianism, which was introduced after the condemnation of that doctrine by the council of Chalcedon. It consisted in maintaining that, although Christ had two natures, yet these natures possessed or acted by but a single will, the human will being merged in the divine, or absorbed by it. The author, or at least the most active propagandist of this doctrine, was Sergius, patriarch of Constantinople, who obtained for it the support of the emperor Heraclius; and its progress was materially forwarded by the silence which, at that time, was preserved of certain points of the doctrine (q.v.), was induced to maintain regarding the question. The doctrine was formally condemned in the sixth general council held at Constantinople in the year 680, with which condemnation it is commonly said that the early controversies on the incarnation were ended. See EUTYCHE and MONOPHYSITES.

MONOThELITES (MONOTHEILISM, ante), persons in the early church who, in the effort to explain the mystery of Christ's person, said that he possessed only one will. Eutyches, about the middle of the 5th c., had taught that Christ had only one nature, his human nature having been absorbed by his divine. The impersonal human nature, he said, was assimilated and, in a manner, defied by the personal Logos, so that his body was not of the same substance as those of mankind generally, but was a divine body. All human attributes, also, in his opinion, were transferred to the one subject, so that it must be said, God was born, God suffered, was crucified, and died. The monophysites, in distinction from the Eutychians, held that the two natures were so united as to become only one nature. And these were followed by the monothelites, who maintained that Christ, though retaining two natures, yet on June 1 will, the human will being merged in the divine. That is, while speaking of two natures, they were in fact Eutychians so far as respected the faculty of the will. This theory was made prominent in the effort of the emperor Heraclius to compose the disputes in the church, and especially to bring back the Eutychians and monophysites, the latter of whom were very powerful. Their leader, Cyrus, patriarch of Alexandria, called a synod, 683 A.D., which approved the monothelite statement, and with good effects at least for a time. Many Eutychians in Armenia, Egypt, and other remote districts, were brought back to the church. The decision, however, was opposed by Sophronius, a monk of Palestine, who, on being made patriarch of Jerusalem, did not hesitate to resist both the open approval

U. K. X.—10
of it by the patriarch of Constantinople and the tacit consent yielded to it by the pope of Rome. He soon summoned a council, which condemned the doctrine of the one will as being a part of the Eutychian heresy. This decision, in its turn, was condemned by the emperor Heraclius, who issued a decree forbidding all controversy on the subject; but his influence in upholding monothelism was soon arrested by his death; and, after much controversy and mutual condemnation, the first synod of the Lateran, 619, adopted the doctrine of the two wills and two energies. The final condemnation of monothelism was pronounced at the 6th general council, Constantinople, 680, where it was declared that there are in Christ two natural wills and two natural operations, without division, conversion, or change; with nothing like antagonism or like confusion; but at the same time that the human will could not come into collision with his divine will, but is in all things subject to it.

**MONOTREMATA** (Gr. monos, single, trina, an opening), the lowest order of mammals, in many of their characteristic points indicate an approximation to birds. The skull is smooth; the brain-case very small as compared to the face; the snout much prolonged, and the jaws unprovided with soft movable lips, and not furnished with teeth. (In the ornithorhynchid there are two horny plates in each half-jaw, which act as teeth, while in the echidna even these substitutes for teeth are wanting.) The cranial bones conosce, as a bird's, at a very early period, and leave no signs of sutures. The external ear is altogether absent; while the eyes, though small, are perfectly developed.

The bones of the shoulder, forming the scapular arch, are unlike those of any other mammals, and in some respects resemble those of birds, and in other respects those of reptiles. At the top of the sternum is a T-shaped bone, formed by the union of the two clavicles, corresponding to the *perecleaum* in the bird's skeleton. The coracoïd bones, which in other mammals are mere processes of the scapulae, are here extremely large, and assisted, as in birds, in strengthening the scapular arch; while the scapulae themselves are extended beyond the socket of the humerus (the glenoid cavity), so as to articulate with the sternum.

The pelvis is provided with marsupial bones, although these animals do not possess a pouch.

The feet have five toes, armed with long nails; in addition to which, the hind-feet of the males are provided with a perforated spur-like weapon, which is connected with a gland. The Australian aborigines believe the wounds made by this spur to be poisonous; but there is no scientific evidence of the fact.

The ovaries are analogous to those of birds, the right ovary being comparatively undeveloped, while the left forms a racemiform mass. The orifices of the urinary canals, the intestinal canal, and the generative canal, open, as in birds, into a common cloaca, from which circumstance the order *Monotremata* derives its name. The mammary glands, of which there is only one on each side, are not provided with nipples, but open by simple slits on each side of the abdomen.

This order includes only two or three species, all natives of Australia or Van Diemen's Land, which, however, form two families—the *ornithorhynchidae* (see *Duck-bill*) and the *echidnidae* (see *Echidna*).

No fossil remains of any animals of this order have as yet been discovered.

**MONOTROPACEE**, a small natural order of exogenous plants, allied to *ericeae* and *pyrolaceae*; but remarkably differing from both in their habits. They are herbaceous plants with scales instead of leaves, and grow parasitically on the roots of pines and other trees, in the northern parts of the world. The only British species is *monotropa hypopitys*, sometimes called yellow bird's nest. The whole plant has a pleasant smell.

**MONREALA**, a city of the island of Sicily, province of Palermo, and 5 m. s.w. of the city of that name, on the flank of a steep hill. Pop. 15,361. It has a cathedral, a palace, several conventual establishments, and possesses a healthy climate. Its chief source of wealth is its export trade in oil, corn, and fruit, almonds being one of its most important products.

**MONEO, ALEXANDER**, an eminent anatomist, and founder of the medical school of Edinburgh, styled primus to distinguish him from his son and successor, was b. at London, Sept. 8, 1607. His grandfather, sir Alexander Monro of Bearcroft, a colonel in the army of Charles II., at the battle of Worcester in 1651, was afterward an advocate at the Scottish bar; and his father, John Monro, for some years a surgeon in the army of king William, in Flanders, on leaving it, entered into practice in Edinburgh. Alexander studied at London under Cheselden, at Paris under Bouquet, and at Leyden under Boerhaave, and in 1719 passed as a surgeon at Edinburgh. In Jan., 1720, he was elected by the town-council first professor of anatomy in the university. Of the establishment and building of the royal infirmary of Edinburgh, he was one of the two principal promoters, and after it was opened, he delivered clinical lectures there for the benefit of the students. In Jan., 1756, he received the degree of m.d., and in March following was elected a fellow of the royal college of physicians of Edinburgh. In 1759 he resigned the anatomical chair to his youngest son, the subject of the following notice, but continued his clinical lectures at the Infirmary. His principal works are—*Osteology, or Treatise on the Anatomy of the Bones* (Edin. 1726, 8vo); *Essay on Comparative Anatomy* (Lond. 1744, 8vo); *Observations, Anatomical and Physiological* (Edin. 1758, 8vo); and an
Account of the Success of Incubation of Small-pox in Scotland (Edin. 1765. 8vo). He was secretary of a society at Edinburgh, which published six volumes of Medical Essays and Observations; many of them contributed by himself. Two more volumes of Essays, Physical and Literary, were subsequently issued by the same society, under the name of the philosophical society. Dr. Monro died July 10, 1767. He was a fellow of the royal society of London, and a member of the royal academy of surgery of Paris.

MORNO, Alexander, secundus, an eminent physician and medical professor, youngest son of the preceding, was b. at Edinburgh, Mar. 24, 1733. He studied at the university of that city; and in Oct., 1755, obtained the degree of M.D. In July following he was appointed joint professor of anatomy and surgery with his father in the university of Edinburgh. He attended for some time the anatomical lectures of prof. Meckell at the university of Berlin. He also visited Leyden. Admitted a licentiate of the Edinburgh royal college of physicians, 1758, he was elected a fellow, 1759, and was afterwards president. On the resignation of his father in the latter year, he became full professor of anatomy, and also succeeded him as secretary of the philosophical society, which in 1785 was incorporated by royal charter, and took the name of the royal society of Edinburgh. In 1757 he published at Berlin a short treatise, De Venis Lympathicis Valendis, in support of the theory, that the valvular lymphatics over the whole of the animal body are one general system of absorbents: which led to a controversy with Dr. William Hunter, of London. Among his other works are—On the Structure and Functions of the Nervous System, a large illustrated folio volume (Edin. 1783); On the Structure and Physiology of Fishes, also an illustrated folio volume (Edin. 1785); Description of all the Bursa Membrane of the Human Body (Edin. 1788); and Three Treatises on the Brain, the Eye, and the Ear, illustrated by plates (Edin. 1797, 4to). He was a member of the royal academies of Paris, Madrid, Berlin, Moscow, and other learned institutions, and one of the first fellows of the royal society of Edinburgh, to whose Transactions he contributed various papers. In 1798 his son, Dr. Alexander Monro, tertius, was conjoined with him in the professorship; and in 1808 he finally retired from the anatomical chair, and from his extensive professional works. He died Oct. 2, 1817, in his 87th year.

MORNO, Alexander, tertius, anatomical professor, son of Dr. Alexander Monro, secundus, born at Edinburgh, Nov. 5, 1773, was educated at the high school and university of that city, and studied medicine, anatomy, and surgery in London. In 1798 he became joint professor of anatomy with his father, and the following year he took his degree of M.D. In 1803 he instituted the class of practical anatomy in the university of Edinburgh, and in 1808 he succeeded his father in the anatomical chair. In 1828 he was president of the royal college of physicians of Edinburgh, and he contributed many valuable papers to his Transactions. He was also a fellow of the royal society of Edinburgh. He retired from his chair in 1847, with the title of emeritus professor of anatomy; and thus ended the connection between the college of Edinburgh and the family of Monro, which lasted for more than a century and a quarter. He died at his seat of Craiglockart, near Edinburgh, Mar. 10, 1859. He was the author of Observations on Crural Heria, plates (Edin. 1803); The Morbid Anatomy of the Gullet, Stomach, and Intestines, plates (Edin. 1811); Outline of the Anatomy of the Human Body (4 vols. 8vo, Edin. 1813) and other professional works.

MORNO, a co. in s.w. Alabama, n.e. of the Alabama river; 990 sq. m.; pop. 70, 14,214—14,180 of American birth. The surface is diversified, and much of it covered with a growth of pine. The soil is fertile, and well adapted to the raising of Indian corn, which is the principal crop. Next in importance are sugar and cotton. Considerable quantities of molasses are manufactured from the cane. It is drained by the Alabama river and Limestone creek. Co. seat, Monroeville.

MORNO, a co. in e. Arkansas, n.e. of the White river, 1040 sq. m.; pop. '80, 9,570—5,160 colored. The surface is even, and a large portion of it is cypress swamps. There are extensive forests of hickory, sassafras, and white oak. The soil is fertile, and produces good crops of Indian corn and cotton. Co. seat, Clarendon.

MORNO, a co. in s. Florida, bounded on the n. by the Caloosabatchie river, on the e. by lake Okeechobee, on the s.w. by Ponce de Leon bay, and on the w. by the gulf of Mexico; 3,060 sq. m.; pop. '80, 10,867—3,208 colored. The surface is flat, with a large area of marsh; a part of the everglades lies in it. Most of the Florida Keys and of the Thousand Isles are within the limits of this county, which is the w. portion of the s. end of the Florida peninsula. Large areas are used for pastureage. Little is under cultivation, and the chief produce is sweet potatoes. Co. seat, Key West.

MORNO, a co. in central Georgia, w. of the Ocmulgee, drained by Tobebska, Towaliga, and Echeconnee creeks, on the Central railroad of Georgia; 370 sq. m.; pop. '80, 18,908—12,112 colored. The surface is uneven and hilly, and the soil generally fertile. Granite, gold, and iron are found. The principal productions are cotton, Indian corn, wheat, oats, and sweet potatoes. Co. seat, Forsyth.

MORNO, a co. in s.w. Illinois, between the Mississippi and Kaskaskia rivers; 360 sq. m.; pop. '80, 13,682. The surface is somewhat uneven. The soil is fertile, and produces large quantities of wheat, Indian corn, oats, and potatoes. There are a num-
ber of flour-mills and harness manufactories. The Cairo and St. Louis railroads pass through it. Co. seat, Waterloo.

MONROE, a co. in s.w. Indiana; area, 420 sq.m.; pop. '80, 15,875—of American birth, 15,577. It is drained by the White river and its tributaries. The surface is uneven, soil fertile, and the principal crops grown are corn, wheat, oats, potatoes, and tobacco. There are a number of saw and flour mills, woolen mills, currying shops, and tanneries. It is on the line of the Louisville, New Albany, and Chicago railroads. Co. seat, Bloomington.

MONROE, a co. in s. Iowa; 430 sq.m.; pop. '80, 13,719—of American birth, 12,227. It is well watered by a number of small streams and creeks. It is largely prairie, with an undulating surface, uneven in some portions. The soil is fertile, and grows large crops of Indian corn. Next in amount are the productions of wheat, oats, butter, hay, and potatoes. There are some saw-mills, flour-mills, and a few smaller manufacturing establishments. It is intersected by the Burlington and Missouri, and Iowa Central railroads. Co. seat, Albia.

MONROE, a co. in s. Kentucky, adjoining Tennessee; 300 sq.m.; pop. '80, 10,742—colored, 660. The surface is uneven. The soil is fertile, and grows, besides tobacco and corn, which are the chief productions, oats, potatoes, and sweet potatoes in considerable quantities. It is watered by the Cumberland river and the source of the Big Barren. Co. seat, Tompkinsville.

MONROE, a co. in n.e. Michigan, along the shores of lake Erie, adjoining Ohio; 540 sq.m.; pop. '80, 33,623. The Huron river flows along its n.e. side. It is watered by the Kaisin river, which passes through a fertile valley, with fine scenery. The most important productions are Indian corn, wheat, oats, wool, potatoes, butter, and hay. There are a number of saw-mills, carriage manufactories, and tanneries. There are also flour-mills, brick-yards and manufactories of agricultural tools. The Flint and Pere Marquette, the Lake Shore and Michigan Southern, and the Canada Southern railroads pass through it. Co. seat, Monroe.

MONROE, a co. in n.e. Mississippi, having the state line of Alabama for its e. boundary, and a branch of the Tombigbee river for its s.w., is drained by that river, intersecting it centrally, and traversed by the Mobile and Ohio railroad; 800 sq.m.; pop. '80, 28,555—28,419 of American birth, 18,004 colored. Its surface is generally level, in some localities low and swampy, in others covered with dense forests of hard wood, interspersed with groves of magnolia, tulip-tree, beech, and elm. Its soil is a calcareous loam, very fertile, and adapted to the raising of live-stock, and the production of wheat, corn, sweet potatoes, cotton, and dairy products. Co. seat, Aberdeen.

MONROE, a co. in n.e. Missouri; 744 sq.m.; pop. '70, 17,149. It is well watered by the Salt river and its tributaries. It is principally a fertile, rolling prairie. Great crops of corn are grown, and wheat, oats, butter, hay, tobacco, and wool, are raised in quantities. Rich veins of coal, limestone, and freestone are found. Agriculture is the principal business, and manufacturing has not been much developed. It is on the line of the Missouri division of the Missouri, Kansas and Texas railroad. Co. seat, Paris.

MONROE, a co. in w. New York, having lake Ontario for its n. boundary; 682 sq.m.; pop. '80, 142,660. It is drained by the Genesee river, the Irondequiot, the Honeoye, and other small streams. It is intersected centrally by the Erie canal, crossing the Genesee river, and the Genesee Valley canal, by the New York Central and Hudson River railroad, the Rome, Watertown and Ogdensburg, and the Rochester division of the New York, Lake Erie and Western railroad. Its surface is generally level, sloping towards the water, and well wooded. Its orchard products are very considerable, and fruit and ornamental trees, apples, and wool are among its exports. Iron is mined; other mineral deposits are Medina sandstone, Silurian limestone, gypseum, and waterline. Its domestic trade is important and its commercial facilities render its foreign commerce of great value. Its unlimited water power is utilized by factories, and among its vast industries are the manufacture of ready-made clothing, boots and shoes, cigars, hats and caps, steam-engines, bank locks, machinery, etc. At its county seat are the Leighton iron bridge works; and its flour mills grind millions of bushels of wheat annually. Co. seat, Rochester.

MONROE, a co. in s.e. Ohio, on the Ohio river; 420 sq.m.; pop. '80, 26,497—24,500 of American birth. The surface is uneven, heavily wooded, and contains deposits of coal. Iron is found in some parts. The soil is fertile, and the chief staples are tobacco and corn. The productions next in importance are oats, wheat, potatoes, hay, butter, and wool. Large quantities of cheese are manufactured. There are saw and planing mills, tanneries and currying shops, furniture factories and flour-mills. Co. seat, Woodsfield.

MONROE, a co. in e. Pennsylvania, having the Delaware river for its s.e. boundary, separating it from New Jersey, a range of the Blue mountains for its s., and the Lehigh river for its n.w. boundary, about 680 sq.m.; pop. '80, 20,175—19,320 of American birth, 155 colored. It is intersected by the Delaware, Lackawanna and Western railroad. Its fertile valleys are interspersed with elevations in some localities, and diversified by forests.
of hickory, walnut, etc. It is drained by Broadhead's and Tobyhanna creeks; limestone and slate are quarried. It contains the charming summer resort of Delaware Water Gap, where the Delaware river breaks through the Blue ridge through a gorge two or three miles long, whose sides rise 1400 feet above the level of the water. The surrounding country is noted for its picturesque scenery. Its soil, on a limestone foundation, produces all the vegetable products of the middle states. Lumber is one of its chief commodities, and leather and flour are manufactured. Among its manufactures are woolen-mills and tanneries. Co. seat, Stroudsburg.

MONROE, a co. in s.e. Tennessee, next to North Carolina; 550 sq. m.; pop. '80, 14,293—1291 colored. The surface is uneven and hilly, and the soil generally fertile in the valleys. The portions are heavily wooded. Wheat, oats, pork, and Indian corn are the chief products. It is on the East Tennesse, Virginia and Georgia railroad. Co. seat, Madisonville.

MONROE, a co. in s.e. West Virginia, having for its s. and s.e. boundary a ridge of the Allegheny mountains, the Kanawha river crossing its extreme n. section and a portion of its s. w.; 500 sq. m.; pop. '80, 11,501—11,446 of American birth, 1131 colored. It is intersected by the Chesapeake and Ohio railroad. Its surface, generally mountainous, is drained by the Greenbrier river, and the New river forming part of its w. boundary. It is largely covered with forests of hardwood diversified by groves of sugar-maple. Its soil is very fertile, producing grain, tobacco, wool, and the products of the dairy, and is highly esteemed for its good pasturage and facilities for stock-raising. Red sulphur and white sulphur springs are found in the s. section. Co. seat, Union.

MONROE, a co. in s.w. Wisconsin; 900 sq.m.; pop. 21,606. The surface is rolling and irregular. The soil is fertile, producing, in large quantities, corn, wheat, oats, potatoes, and hay. Large amounts of wool and butter are made. Many tons of hops are annually gathered. There are a number of saw and flour mills, and many miscellaneous manufactories, as cooper, machine, and carriage shops, and paper and clothing mills. The La Crosse, Kickapoo, Lemonweir, and other rivers pass through it. It is on the line of the Chicago, Milwaukee and St. Paul, and of the West Wisconsin railroads. Co. seat, Sparta.

MONROE, a city of Michigan, United States, is situated on the river Raisin, 2 m. from Lake Erie, and 32 m. s.w. of Detroit. It is the eastern terminus of the Michigan Southern railway. It has a large court-house, 7 churches, woollen manufactories, flour-mills, etc. Pop. '74, 5,782. Monroe was settled by the French in 1779.

MONROE (contd.). This pleasant old French town in Michigan, though left behind by the cities of Toledo, south, and Detroit, north, remains the seat of a young ladies' seminary and several prosperous manufacturing industries, and extensive nurseries, and makes moderate shipments of produce, sand for glass-making, etc. It was settled under the name of Frenchtown, by French from Detroit, in 1781. The battle of the river Raisin, between the English and their Indian allies and an American force, occurred near Monroe in 1813, resulting in the massacre of several hundred American prisoners.

MONROE, James, fifth president of the United States, was b. in Westmoreland co., Virginia, April 28, 1758. He was descended from a captain Monroe of the army of Charles L., who emigrated, with other cavaliers, to Virginia. James Monroe entered the revolutionary army at the age of 18, as a cadet, and was present at several battles; but having lost his rank in the army by serving as aide-de-camp, he commenced to study law with Jefferson. In 1782 he was elected to the assembly of Virginia, and at the age of 23 to the executive council. Next year he was elected to congress, where he took an active part in the movements for framing a new constitution. He joined with Patrick Henry and other leading states' rights men in opposing the ratification. He feared the power and encroachment of the federal government. He was afterwards sent by Washington as minister to France, and was received with singular enthusiasm by the revolutionary government. He was, however, soon recalled, for having too decided French sympathies. In 1799 he was elected governor of Virginia; and in 1803 sent by Jefferson as minister to France, to purchase Louisiana, which vast territory he secured for 15,000,-000 dollars. He was now employed for several years in diplomacy in England and Spain. On the election of Mr. Madison to the presidency, he was made secretary of state, and also performed the duties of secretary of war. In 1816 his eminent services were rewarded by his being elected president of the United States by the democratic-republican party, and he made himself very popular. The acquisition of Florida from Spain, and the settlement of the vexed question respecting the extension of slavery by the Missouri compromise, by which, after the reception of Missouri as a slave state, the institution was prohibited above the line of latitude 36° 30', helped to secure his re-election. His most popular acts, perhaps, were the recognition of the independence of Mexico and the South American republics, and the promulgation of the Monroe doctrine, in which he declared the American policy of "neither entangling ourselves in the broils of Europe, nor suffering the powers of the old world to interfere with the affairs of the new," and that "any attempt to extend their system to any portion of this hemisphere would be dangerous to our peace and safety." In 1825 he retired to his seat at Oak Hill, Loudon co., Virginia; but he still
continued in the public service. After being twice president, he acted as justice of the peace, a visitor of the university of Virginia, and member of a state convention; but a profuse generosity and hospitality caused him to be overwhelmed with debt, and he found refuge with his relations in New York, where he died in 1831—like his predecessors, Adams and Jefferson, on July 4. He was an honorable and able statesman, though not a speaker or a man of brilliant talents.

MONROE DOCTRINE, a scheme of public policy, named after its author, James Monroe, fifth president of the United States of America, by whom it was enunciated in his message to congress, Dec. 2, 1823. Mr. Monroe set forth in his message that "as a principle, the American continents, by the free and independent position which they have assumed and maintained, are henceforth not to be considered as subjects for future colonization by any European power;" and that any attempt on the part of the European powers to "extend their system to any portion of this hemisphere" would be regarded by the United States as "dangerous to our peace and safety," and would be opposed accordingly.

MONS (Flem. Berglen), an important t. of Belgium (formerly fortified), capital of the province of Hainault, on the Trouille, 55 m. s.w. of Brussels. Its fortifications were renewed and strengthened since 1818, but in 1866, in accordance with the new arrangement for the defense of the country, they were demolished. The immediate vicinity can be laid under water by altering the course of the Trouille. The canal de Comité connects the town with the Scheldt, and there is communication by railway with Brussels, Valenciennes, Charleroi, etc. Its principal architectural ornament is the cathedral of St. Waudru, dating from the 15th and 16th centuries—a masterpiece of Gothic. The chief manufactures are woolen and cotton goods, cutlery, small-wares, and sugar refining. The vicinity forms an extensive coal-field, with about 400 pits. A large trade is carried on in coals, flax, hemp, horses, and cattle. Pop. '75, 24,539.

Mons, supposed to occupy the site of a Roman station, was made the capital of Hainault by Charlemagne in 804. During the 17th and 18th centuries, it was frequently the object of contest between France and Austria.

MONSEIGNEUR, a French title, compounded of the words mon and seigneur, meaning my lord, applicable to royal or imperial princes, cardinals, archbishops and bishops of France, and accorded in courtesy to the high officers of government, and persons generally of high rank. Its plural is messieurs. Abbreviations mgr., mgrs. The title was not applied to bishops until about the close of the 17th c., when they acquired it by concert of adoption in addressing each other in that way. Their title previously was simply Monsieur. A law of the French convention in 1801 interdicted the use of the title to bishops and archbishops, and required them to confine their signature titles, and their addresses to each other to the words citoyen or monsieur. In the language of French thieves monsieur is applied to a tool used to break locks.

MONSELICE, a walled t. of North Italy, 13 m. s.e. of Padua, on the canal of Monselice, which extends from Padua to Este. Monselice was a place of importance in the middle ages. It has several silk-mills. Pop. 3,160.

MONSIEUR, plural messieurs, a French title formerly addressed to persons of medium rank, and corresponding to sir or my sir in English; now universally employed in French by all gentlemen in addressing each other. It is also used as a prefix to titles of rank, as monsieur le prince, messieurs les députés, monsieur le président; and as a form of respect in mentioning a third person without regard to rank, as monsieur votre frère, monsieur votre cousin, etc. In the middle ages the title was given to saints, as monsieur saint Pierre, monsieur saint Jean, etc., and also in the same manner applied as a prefix to the names of popes and of members of the royal family when alluded to in the third person. It was the special title of the oldest brother of the French king, the duke of Orleans, who was specifically indicated when one spoke simply of monsieur. The title is dropped before the names of persons of great fame, as belittling when speaking of them, as Lamartine, Carnot, etc.

MONSON, a t. in Hampden co., Mass., 15 m. e. of Springfield; pop. '80, 3,578. It contains manufactories of hats and bonnets, and woolen goods, a national bank, 3 churches, an academy, and a state school for the children of alien proprietors. The Boston and Albany, and New London Northern railroads pass through it. The Monson academy has long had a high repute, attracting students in preparation for college from distant places; and noted for its moral and religious influence. Many men of eminence have gained here the foundation of their education. It is one of the schools chosen for the education of the youth sent to this country for study, and supported here, by the Chinese government.

MONSON (Malayan, monsin) is derived from the Arabic word musin, a set time or season of the year, and is applied to those winds prevailing in the Indian ocean which blow from the s.w. from April to October, and from the opposite direction, or n.e., from October to April. The existence of these winds was made known to the Greeks during the Indian expeditions of Alexander, and by this knowledge, Hippalus was emboldened to sail across the open sea to Muzeris, the emporium of Malabar. The monsoons depend, in common with all winds, whether regular or irregular, on the inequality of heat at dif-
fertent places and the earth's rotation on its axis; but more particularly they are occasioned by the same circumstances which produce the trade-winds and the land and sea breezes, being, in fact, the combined effect of these two sets of causes.

If the equatorial regions of the earth were entirely covered with water, the trade-winds (see **Trade-winds**) would blow constantly from the n.e. in the n., and from the s.e. in the s. of the tropical zone, with a belt of variable winds and calms interposed; the whole system, following the sun's course, moving northward from December to June, and southward from June to December. But, especially in the eastern hemisphere, large tracts of land stretch into the tropics, and give rise to the extensive atmospheric disturbances for which those parts of the earth are so remarkable. During the summer half of the year, the n. of Africa and the s. of Asia are heated to a higher degree than the Indian ocean, while Australia and South Africa are much colder. As the heated air of southern Asia expands and rises, and the colder air from the s. flows in to supply its place, a general movement of the atmosphere of the Indian ocean sets in towards the n., thus giving a *southerly* direction to the wind; but as the air comes from those parts of the globe which revolve quicker to those which revolve more slowly, an easterly direction will be communicated to the wind; and the combination of these two directions results in the s.w. monsoon, which prevails there in summer. Since, during winter, South Asia is colder than the Indian ocean, which, again, in its turn, is colder than South Africa, a general motion of the atmosphere sets in towards the s. and west. As this is in the same direction as the ordinary trade-wind, the effect in winter is not to change the direction, but only to increase the velocity of the trade-wind. Thus, while s. of the equator, owing to the absence of sufficiently large tracts of land, the s.e. trade-winds prevail throughout the year; on the n. of the equator we find the s.w. monsoon in summer. As might have been expected, the monsoon off the coast of Mozambique is easterly, and that off the coast of West Australia north-westery. The trade-winds also suffer considerable change in their direction on the coasts of Brazil, Peru, Lower Guinea, etc. These, though sometimes considered monsoons, are not truly such, for they do not change their directions periodically, so as to be opposite to each other, like true monsoons, but only veer through a few points of the compass. For a fuller account of these partial deflections, see **Trade-winds**.

In April, the n.e. monsoon changes into the s.w.; and in October, the s.w. into the n.e. These times depending on the course of the sun, and consequently varying with the latitude, are called the breaking up of the monsoons, and are generally accompanied by variable winds, by intervals of calm, and by furious tempests and hurricanes.

Monsoons, when compared with the trade-winds, will be found to play a most beneficial and important part in the economy of the globe. Their greater velocity, and the periodical changes which take place in their direction, secure increased facility of commercial intercourse between different countries. But the full benefits following in their train are not seen unless they be considered in their relation to the rain-fall of southern Asia. Indeed, the fertility of the greater part of this fine region is entirely due to the monsoons; for if the n.e. trade-wind had prevailed there throughout the year, central and western India, and many other places, would only have been searched and barren saharas. The rain-fall of India depends entirely on the monsoons. The coast of Malabar has its rainy season during the s.w. monsoon, which brings thither the vapors of the ocean. On the Coromandel coast, on the other hand, it is the n.e. monsoon which brings the rain from the bay of Bengal. The two coasts of Hindustan have therefore their seasons reversed, the dry season of the one corresponding with the wet season of the other.

**MONSTER.** See **Monstrosity**, in anatomy.

**MONSTRANCE** (Lat. _monstrare_, to show), called also _ostensory_, the sacred utensil employed in the Roman Catholic church for the purpose of presenting the consecrated host for the adoration of the people, as well while it is carried in procession, as when it is exposed upon the altar on occasions of special solemnity and prayer. The use of the monstrance probably dates from the establishment of the festival of Corpus Christi in the 13th century. It consists of two parts, the foot or stand upon which it rests, and the repository or case in which the host is exhibited. The latter contains a small semicircular holder called the _bunche_, or crescent, in which the host is fixed; and it appears anciently to have been of a cylindrical or tower-shaped form, in the central portion of which consisting of a glass or crystal cylinder, the host was placed. At present it is more commonly in the form of a star or sun with rays, the central portion of which is of glass or crystal, and serves to permit the host to be seen. This portion, or at least the crescent, is of gold or of silver gilt; the rest is generally either of the precious metals, or at least gilt or silvered, although the lower portion is occasionally of bronze artistically wrought. In many cases it is of most costly materials and workmanship. The mon-
strance, like the other vessels used in the Eucharistic service, is consecrated by a bishop, or a priest delegated by a bishop. By a peculiar usage of the city of Lucerne, in Switzerland, the Eucharist is always carried in the monstrosity, when being borne to the sick.

MONSTRELET. ENGULFED IN DE, 1390-1453; a chronicler following immediately after Froissart, and with less charm of narration, the first clear, reasoning, and exact collector of the facts of the history of his time. In 1430 he had a civil and military function in Conpagnie, and was afterwards present at the interview between Jean d'Arc and the duke of Burgogne. His chronicles of the 15th c. were republished in 7 vols., Paris, 1857.

MONSTROSITY, in anatomy. When an infant, or the young of any animal, comes into the world impressed with morbid changes, which occur only in fetal life, and of which it has never been observed that they have originated in the same way after birth, such an infant or young animal is said to be a monster or monstrosity. Monsters were formerly regarded as prodigies of nature; and in the dark ages their occurrence in the human species was usually ascribed to the intercourse of demons and witches. It is now perfectly understood that the formation of those apparently anomalous beings may be accounted for by the same laws as those which govern the formation of perfect individuals—the only difference being that these laws in the case of monstrosity are more or less arrested or otherwise perverted.

Amongst the principal causes of monstrosity may be mentioned: 1. Something deficient or abnormal in the generative matter of one or both parents, because, as has been shown in the article Hereditariness, malformations are frequently transmitted from parents to the children. Hence the morbid change is impressed upon the fetus at the moment of impregnation. 2. Some morbid condition of the maternal organs or constitution may exercise a disturbing influence on development. 3. Diseases and abnormal states of the placenta, of the membranes of the ovum, and of the umbilical cord, may induce an arrest of development; for example, it may be easily understood how abnormal shortness of the cord may favor the origin of absurdity of the abdomen; while a cord of disproportional length may coil round one of the extremities, and by constriction may damage or even amputate it. 4. Morbid influences acting directly on the fetus as mechanical injuries and diseases affecting it, are the most frequent causes of malformations. From the experiments of several observers, it has been shown that by submitting hens' eggs to various mechanical influences during incubation, the development of the embryo may be interrupted, or modified in such a manner as to give rise to malformations; and many observations tend to prove that mechanical influences affecting the womb (kicks, blows, or falls) in the early months of pregnancy, produce certain malformations, by causing an arrest of development. Moreover, the fact that certain malformations usually occur only in twin or triplet pregnancies, favors the view that certain monstrosities are due to pressure and confined space.

Of the various classifications of monstrosities, the following is perhaps the best: 1. Malformations in which certain parts of the normal body are entirely absent, or are too small. 2. Malformations produced by fusion or coalescence of organs. 3. Malformations in which the parts of the body are separated and clefts or fissures occur. 4. Malformations in which natural openings are closed. 5. Malformations of excess, or in which certain parts have attained a disproportional size. 6. Malformations in which one or more parts have an abnormal position. 7. Malformations of the generative organs.

The first class includes (1) completely shapeless malformations, in which the monster presents the appearance of a lump or mass, with no indication of definite organs; (2) malformations which consist of only a more or less rudimentary trunk, with no head or extremities; (3) trunkless monsters, in which the inferior parts of the body are wanting, and little more than a rudimentary head is present, which, instead of neck and trunk, is furnished with a pouch-like appendage, containing rudimentary viscera and pieces of bone; (4) malformations in which the head, and sometimes a part of the upper part of the body, are wanting, consisting of acephalic monsters, which are by no means rare, and of which numerous cases have been described; (5) malformations in which the whole head is not absent, but some of its component parts are wanting—as, for example, the brain, some of the cranial bones, the nose, or the eyes; (6) cases in which the extremities are absent or imperfect to a greater or less degree—for example, they may be mere stumps, with the fingers and toes either absent or rudimentary, or the hands and feet may appear to exist independently of arms and legs, and to be inserted immediately into the trunk; (7) cases in which all the organs may be present, but some of them may be too small—thus, there may be general dwarfishness, or the head or limbs may be abnormally small. None of the monsters of this class, except those included in the last two groups, are viable.

In the second class are included such cases as (1) the various forms of cyclopia, or coalescence of the eyes; these malformations are not very rare in the human subject, and are of frequent occurrence in pigs and other animals; although usually born alive, these monsters are not viable; (2) coalescence of the lower extremities either into a common limb, which supports two feet, or into an undefined tail-like mass; (3) minor anom-
gumations, which do not affect vitality, as more or less perfect coalescence of the fingers and toes.

The third class embraces such cases as (1) fissures of the cranium, which are generally due to hydrocephalus in the fetus; (2) hard lip and clef palate; (3) fissures on the neck, whose origin is due to the respiratory clefts—which, during the formation of the embryo, appear in the cervical region, not uniting at an early stage, as in the normal condition, but remaining more or less open; (4) fissures of the vertebral arches of the spinal column, occasioning the affection known as spinæ bifida; (5) fissures of the thorax, in which case the lungs or heart are more or less exposed; (6) fissures of the abdomen.

The malformations of the fourth class include congenital closure of the anus, the mouth, the nostrils, etc.

The malformations of the fifth class may be arranged in two divisions, according as certain parts are too large, or there are supernumerary organs.

The sixth class is very extensive, and embraces many varieties. One or more parts may be disproportionately large—as, for example, the head in cases of congenital hydrocephalus; or there may be one or several supernumerary organs—a sub-class which presents a very great range, from the simplest cases, in which a single joint of a finger is supernumerary, to those of a highly complicated nature, when two or even three bodies are united by some one point. There may be a single head and trunk and supernumerary parts—as, for example, supernumerary teeth, vertebrae (giving rise to the formation of a tail in the human subject), ribs, mammary, fingers, toes, etc.; or there may be malformations with more than one head and trunk—double, or even triplet monsters. This sub-class is divisible into two groups, according as the united individuals are equally developed, or as only one is developed; the second being more or less atrophied, and forming a parasitic appendage to the first. As examples of the first group, we mention (1) duplication of the head and upper part of the vertebral column; (2) duplication of the head, neck, and upper extremities, while the chest and abdomen are single, or fused into one another (in this group, we must place the twin-monster Rita Christina, who was born in Sardinia in Mar., 1829, and was brought alive to Paris, where she died in the November of that year); (3) almost complete duplication, with separation of the two bodies, except at a single spot, as in the case of the Siamese twins; (4) triplet monsters, such as the child with three heads born in 1822 in Catania (see Geoffroy St. Hilaire, Histoire des Anatomies de l'Organisation, vol. iii, p. 327). To the second group belong such cases as the following: (1) a perfect individual may bear on its head another head, with traces of the rest of the body; (2) a well-developed body, a second, smaller and defective one, may be situated, which, after birth, does not increase in size; (3) in a more or less perfectly developed individual, there may be concealed, commonly in the abdomen, parts of a second individual—a condition which has received the name of fetus in fetus, and which is most probably caused by the inclusion of one germ by another.

To the sixth class belong (1) those cases in which there is a reversion of the position of the internal organs—when the heart and spleen lie upon the right, and the liver and cæcum on the left side; (2) anomalies in the course and distribution of individual vessels.

The malformations constituting the seventh class have been sufficiently noticed in the article Hermauncoemus.

The term teratology (from the Greek words τερατος, a prodigy, and χαμος, a discourse) is now frequently applied to the history and science of monstrosities. For further information on this subject, the reader is referred to Geoffroy St. Hilaire, Histoire des Anatomies de l'Organisation (3 vols. 1822-36); Otto, Monstrorum Secratorum Descriptio Anatomica (1841); and to the article "Teratology," by Vrolik, in The Cyclopaedia of Anatomy and Physiology.

MONSTROSITY, in botany, is a malformation or abnormal development of any part of a plant. It may take place, however, at any period of the growth of a plant, as to any new organ that is developed, and sometimes merely affects a particular organ or some portion of a plant, as a particular leaf, flower, petal, sepal, etc., or the leaves or flowers of a particular branch, while in other cases all the organs of the same kind exhibit the same abnormal character. As in animals, it is now well known that monstrosities in plants are the result of special conditions affecting the operation of ordinary natural laws; and the study of monstrosities is very important in relation to that of the nature, development, and metamorphosis of organs. In the article Metamorphosis or Organs, some of the most frequent monstrosities are alluded to. Monstrosities in plants are not always, as in animals, reckoned deformities Double flowers afford a familiar example of an opposite kind; although with regard to the plant itself, they have the effect of unfitting it for one of the functions of a perfect plant, reproduction by seed.

MONTAGNA VA, a t. of northern Italy, in the province of Padua, situated pleasantly on the banks of a canal, Il Fiumicello, 52 m. s.w. of Padua. It is still protected by walls and towers, and has a fine cathedral and palace. Pop. 7,657. Its chief trade is in wool, silk, wood, hemp, and coarse cotton textures.

MONTAGNARDS, or simply Montagne, "the Mountain," the name given to the extreme democratic politicians in the first French revolution, because they sent themselves on the higher benches of the hall in which the national convention met. Their
principal members were Danton, Marat, Robespierre, St. Just, and Collot d'Herbois, the men who introduced the "reign of terror." The opposite party of the "plain" (plaine) were the Girondists (q.v.), who sat on the lowest benches on the floor of the house. After the overthrow of the Girondists, this part of the house was styled the "marsh or swamp" (marais), and included all the subservient members whose votes were under the control of "the Mountain." A few leading men gave all its strength and formidable character to the party of the Mountain. After 1848, the extreme party in the national assembly, composed of revolutionary democrats and communists, sometimes flattered itself with the designation of "the Mountain," but proof has not been obtained a seat in parliament.

MONTAGU, FAMILY OF. This noble family are said, by Burke, to derive their name, which in Latin was and is always written De Monte Acuto, from a place in Normandy; and the first of the Montagus who settled in England was a warrior who came over in the train of Robert earl of Moreton at the conquest. Five centuries later, we find his descendant, sir Edward Montagu, lord chief-justice, in succession, of the courts of king's bench and common pleas under Henry VIII., who also appointed him one of the executors of his will and guardians of his son Edward. His grandson, who was a distinguished orator, represented the city of London in Parliament; and having been lord chief-justice of the court of king's bench, and lord treasurer of the kingdom, was raised to the peerage as earl of Manchester. The second earl gained distinction as a general in the parliamentary army, and more particularly by his victory over Prince Rupert at Marston Moor; but he scurried to take part in the condemnation and execution of Charles, and was one of the first members of the house of peers who gave in his adhesion to Charles II. on his restoration. This nobleman's grandson enthusiastically espoused the cause of William III., under whom he fought at the battle of the Boyne, and took part in the siege of Limerick. He was subsequently sent as ambassador to Venice and to the courts of France and Vienna, and eventually was raised to the dukedom of Manchester by George I. The title is still enjoyed by his descendant, the 7th Duke. Other branches of the Montagu family were ennobled in the person of the earl of Sandwich, the earl of Halifax, and the duke of Montagu, but the last two titles Loth became extinct before the close of the 18th century.

MONTAGU, BART., 1779-1851; b. London. He was the son of John Montagu, fourth earl of Sandwich, and of Miss Ray, who was shot in 1759 in the piazza of Covent garden by the rev. James Hackman in a fit of jealous frenzy. He received his early education at the Charter House school in London, and took the degree of m.a. at Cambridge in 1790, distinguishing himself by his love of literature; entered Gray's Inn, and was admitted to the bar in 1798. While in London he became intimate with Coleridge, and adopting the opinions of Godwin, determined to abandon the law, but was dissuaded by sir James Mackintosh. He was a copious and able writer. The most important of his works is A Digest of the Bankrupt Laws, in 4 vols., for which he obtained in 1806 the office of commissioner of bankruptcy. This became a standard work and passed through many editions. It was distinguished for his efforts to mitigate the severity of the penal code. He wrote several pamphlets on capital punishment, and with Wilberforce, Romilly, and others succeeded in obtaining the abolition of hanging for forgery. He edited Bacon's works in 16 vols. He published 40 vols., and left 160 more in manuscript.

MONTAGU, EDWARD WORTLEY, 1719-76; b. Wharncliffe, Yorkshire, Eng., only son of Edward Wortley and lady Mary. When very young he ran away from Westminster school repeatedly, gave himself up to the lowest vices, and hired himself out as a cabin boy in a ship sailing for Spain, where he was discovered by the British consul at Cadiz, and restored to his family. He was then committed to the charge of a private tutor who obtained for him an appointment to a public office. He was then sent to travel on the continent under the care of the tutor, and while abroad he published his first work, Reflections on the Rise and Fall of Ancient Republics. While at Paris he became involved in an altercation with a Jew which led to a criminal prosecution. On his return to England he married, while still under age, a woman much older than himself, and in a few months deserted her. Notwithstanding this, he was elected to Parliament in 1814, and was re-elected, until being involved in debt by his extravagance he was forced to resign. He again went abroad, never returning to England. He proceeded first to Italy, became a convert to popery, and then went to Egypt where he turned Mohammedan. He spent the remainder of his life in the Levant, having been in the mean time disenchanted by his parents, but was on his way back to England when he died at Acre. Besides the tract before mentioned he wrote another, entitled An Examination into the Cause of Earthquakes, and contributed some papers to the Philosophical Transactions. His tract on Ancient Republics was claimed as the production of Mr. Foster, his tutor.

MONTAGU, ELIZABETH ROBINSON, 1720-1800; b. York, Eng.; was married in 1742 to Edward Montagu, grandson of the first earl of Sandwich, who on his death left her a large fortune. With abundance of wealth, and possessing literary talent, she became a leader in London society, and her residence was the favorite resort of literary persons. For several years she gave annual dinners on May-day to the chimney-sweeps...
of London. She wrote three Dialogues of the Dead, published in Lord Lyttleton's work by that name, and an Essay on the Writings and Genius of Shakespeare, compared with the Greek and French Dramatic Poets. She is well known by her correspondence in 4 vols.

MONTAGU, LADY MARY WORTLEY, was eldest daughter of Evelyn, earl, and afterwards (1715) duke of Kingston. She was born about 1690, and is said to have received a classical education. When only eight years of age she was introduced by her father to the famous Kit-Cat club, and formally admitted a member. Her fond pleasure-loving father allowed her to educate herself. She is even said to have taught herself Latin. She became attached to Mr. E. Wortley Montagu, a member of the house of commons, whose cousin, Charles Montagu, was created earl of Halifax, and appointed first lord of the treasury, by George I. As the match was disapproved of by the families, she was obliged to elope before she could marry him. On the accession of George I, she came to London with her husband, who was a whig. Lady Mary's beauty and wit attracted universal admiration at court. She was in habits of familiar acquaintance with Addison and Pope, the latter becoming her enthusiastic admirer, and writing "flames and raptures" for her, until his passion "came to a climax in an imperception, and was extirpated by a box on the ear, or some such rebuff." In 1716 Mr. Wortley Montagu was appointed ambassador to Constantinople. He was accompanied by lady Mary, who, on her journey, and during her residence in the Levant, wrote the well-known Letters, which form one of the most delightful books in our language. The weaknesses of a somewhat vain and capricious temper fade into forgetfulness, when we remember the strong sense, enlightened courage, and generous perseverance which introduced into Europe the practice of inoculation, which she witnessed in Turkey. She had so much faith in its safety, that she tried it first on her own son. See INOCULATION. After her return to England she fixed her residence at Twickenham, and renewed her intimacy with Pope. But political soon led to personal differences, and these resulted in one of the most famous literary feuds of the 18th century. The immediate occasion of it was the publication by lady Mary of her Towse Eclogues. She was fiercely assailed by both Swift and Pope, and was not slow to retaliate. In 1737 she left her country and her husband (for reasons that are not known), and lived for many years in Italy, chiefly at Rovero, in the province of Venice. Her husband died in 1761. At the request of her daughter, afterwards wife of the earl of Bute, she returned to England, where she died 21 Aug., 1762. A collected edition of her works, with life, was published by her great-grandson, the late lord Wharncliffe, in 1835, of which a third edition appeared in 1861.

MONTAGUE, a co. in n. Texas, bounded on the n. by the Red river, which separates it from the Indian territory, and drained by the Denton fork of Trinity river, and by Clear creek; 850 sq. m.; pop. '80, 11,257—11,163 of American birth. The soil in the vicinity of Red river is good. Cattle raising is the chief business. Co. seat, Montague.

MONTAGUE, CHARLES. See HALIFAX, EARL OF, ante.

MONTAJONE, a t. in n. Italy, near the sea, about 25 m. s.w. of Florence, having mineral springs celebrated for their medicinal properties; pop. 10,553. It is in a province of the same name.

MONTaigne, Michel Eyquem De, a distinguished French moral philosopher, was b. in 1533, at his paternal home of Montaigne, in Perigord. In accordance with his father's eccentric ideas on education, he was taught, and suffered only to speak Latin from his earliest infancy, in consequence of which he acquired such a perfect mastery over the language, that when, in his tenth year, he entered the college of Bordeaux, his masters, Grouchi, Buchan, and Muret, were almost afraid to address him. On the expiration of his course of studies, which were directed to law, he received, in 1554, the appointment of counsellor in the parliament of Bordeaux; but being possessed of ample means, and having no inclination for a public life, he devoted himself to the study of the various schools of Greek and Roman philosophy; and on the death of his father, in compliance with whose wish he had made a translation of the natural theology of Raymond Schondus (Paris, 1560), he retired to his ancestral estate, where he lived in retirement during the terrible season of religious oppression which desolated France for so many years. During this period, 1560, he composed the first two books of his celebrated Essais, the third portion of which appeared in 1588, after his return from an extensive course of travels, which he had undertaken partly to escape from the plague, and partly for the improvement of his own health, and during which he visited Rome, and was received with signal favor by the pope. Montaigne's Essais, although not conceived in the spirit of a believing Christian, or marked by the reticence and delicacy of expression which modern refinement demands, are very extraordinary productions, not only for the learning and sound reasoning which they manifest, but also for the frank and liberal tone in which social questions are discussed, notwithstanding that the author wrote at a period when religious differences and party feelings blinded the judgments of men. Montaigne's ethics were those of Seneca and the other philosophers of ancient times, whose works he had so thoroughly mastered; and, judged from our point of view, his morality is that of a virtuous pagan merely; but when we bear in mind the turmoil of civil war, and the
consequent disorganization of society, together with the low ebb of literature in France at that period, we must do justice to the great merit of the writer, and the influences for good which his writings exerted. Montaigne was a constant, and occasionally a successful mediator between the party of Henry of Navarre and that of the Guises, and stood in relations of friendship with men of all creeds. He died in 1592 as an avowed member of the Church of Rome, in whose doctrines he professed implicit faith, notwithstanding the sceptical bias which he had through life been at no pains to conceal. Numerous editions have appeared of his Essais, among which we may instance those of De Coste (3 vols. Hag. 1727), and Victor Leclere (Paris, 1828). Nearly 200 years after his death, the discovery was made at Montaigne of the MS. of his travels, which was published at Paris in 1774 under the title of Journal de Voyage de M. de M. en Italie par Montalcino. Translations of the Essais exist in almost all the European languages; the best English translation is that by Cotton. The best biographies of Montaigne are by Grün (Paris, 1855); Payen (Paris, 1856); and Bayle St. John (Lond. 1857).

MontacliNo, a t. in the province of Siena, Central Italy, 22 m. s.s.e. of the town of Siena, stands on a hill in the midst of valleys, and enjoys a fine equable climate. Pop. 7,540. The wine of Montalcino is in high repute throughout Tuscany.

Montalembert, Charles Forbes, Comte de, was b. in April 1810 of an ancient family of Poitou. His father was created a peer of France under the Restoration, and for a considerable time was minister of the French court in Sweden. His mother was the Scottish family of Forbes, to which Mr. Forbes cognizantly related. Montalembert's acquirements in familiarity with the English language, and his intimate knowledge and strong admiration of the social and political institutions of England. Although his more advanced studies were carried on in the university of Paris, a considerable part of his youth was spent in Sweden; and the first work by which he was brought into notice, was a pamphlet on Sweden, which he published in his nineteenth year. On the death of his father, Montalembert succeeded to his honors, and to his seat in the Chamber of Peers. But his earliest public appearance was in what may be truly considered as the great labor of his life, a joint effort in which he associated himself with the Abbé Lacordaire (q.v.) and other friends, for the purpose of taking advantage of the recent charter, by establishing a free school for Catholic education, independent, as well of the university, as of all other state influence. An attempt on the part of the police to interfere arbitrarily with this project, became the subject of a trial before the Chamber of Peers, which Montalembert rendered memorable by his brave speech, one of the most brilliant and eloquent that ever was heard. It is one of the most characteristic marks of the bold and uncompromising earnestness in the cause of his church and of the common interests of religious liberty, which have constantly characterized his later career. Of the struggle of the Catholic party in France against what they regarded as the arbitrary monopoly of education which was claimed for the university, Montalembert was for many years the leader and champion; and in the various works in the preparation of which he employed all his leisure from public duties, his Life of St. Elizabeth of Hungary, his Life and Times of St. Ainsch, and, above all, in an appeal On the Duty of Catholics on the Question of Freedom of Education, which he wrote during a visit to the island of Madeira for the recovery of his health in 1843, he never ceased to advocate the same principles. After the revolution of 1848, Montalembert, true to his former professions, was one of the first of his party to accept of the new state of things, and to use the actual means at his disposal for the furtherance of the views which he had so long advocated. He was, although member of the nation, and afterwards of the legislative assembly; and for a time contrived, while he continued the same line of policy as regards church interests, to give a general support to the government of Louis Napoleon as president of the republic. His first break with that government was on the question of the proposed confiscation of the Orleans property; and after the coup d'etat of December, the breach became irreconcilable. From that time, Montalembert continued to be the implacable assailant of the arbitrary repression of public opinion which characterized some measures of Napoleon III. and the brilliant and enthusiastically admiring pictures, which in his Political Future of England, he has drawn of its social and political institutions, derive much of their vigor from the covert but palpable contrast with the condition of France which points them all. Besides numerous articles contributed by him to the Revue des Deux Mondes, the Encyclopdie Catholique, and the Correspondent, he also wrote: L'Avant-politique de l'Angleterre (1855); Les Moins d'Occident depuis St. Boniface jusqu'à St. Bernard (1860—67); L'Eglise libre dans l'Etat Libre (1863); Le Pape et la Pologne (1864), etc. He died Mar. 13, 1870. See Memoir by Mrs. Oliphant, 2 vols. (1872).

Montalembert, Marc René, Marquis de, 1714—1800; b. and educated in Angoulême; entered the army at the age of 18, and while engaged in military service made a specialty of scientific study, and in 1747 became a member of the academy of sciences of Paris. In 1751 he constructed foundries at Rouelle for cannon of larger caliber than previously used, which were employed in the seven years' war (1756—63), in which he was general in the service of Sweden and Russia. He aided Todechen in the capture of Berlin in 1760, and the following year had finished a great work on fortifications, which he was about to publish, when the French minister, Choiseul,
interdicted the publication in order to have it for the sole benefit of France. He became the chief military engineer of France, and his systems proved superior to all others. In 1779 he constructed a fort of wood on the Isle d'Air, which was found to have wonderful resistance in proportion to its cost. At the beginning of the French revolution Mirabeau undertook to make him inspector-general of the fortifications of France, but his rank was a bar-sinister. In 1792 the French war office, under Carnot, purchased his collection of models, and he became the trusted adviser of that minister. He lived to see his inventions and theories, following in general the system of Vauban, adopted in France and through all Europe, after many years of almost contemptuous opposition. His main work is Fortification perpetuë, 11 quarto vols., 1757-78; re-edited and published in 1793 under the title of L'Art défensif supérieur ou l'art à l'offensive. He was also author of many memoirs on various subjects, of poems, and of comedies.

MONTALVAN, JUAN PEREZ DE, 1802-38, b. Madrid. He received instruction and assistance from the famous dramatic writer Lope de Vega, to whom he became greatly attached, and whom he adopted as his model in almost everything. Like his master, he entered the priesthood, and accepted an office in the inquisition. At the age of 30 he had written 36 dramas, and in 1636 the number had increased to 60. The construction was flimsy and the execution careless. One of his last works was an extravagant panegyric, in 1636, on his friend and instructor. His intense and incessant study had now begun to affect his brain, and he soon fell into a state of imbecility, which continued till his death. His collected dramatic works appeared in 1638-39, and were reprinted in 1652.

MONTANA (state), a territory of the United States, formed in 1864, extending from lat. 45° to 49° n., and long. 104° to 116° west. It is mostly to the east of the Rocky mountains, and is bounded, n. by British America, w. by Washington and Idaho, s. by Wyoming, e. by Dakota. Its average length is 470 m., its average breadth 275 m., and its area 14,776 sq. m., or 92,016,640 acres, of which, in 1870, 84,674 were under cultivation. Montana has great mineral wealth, not yet fully taken advantage of, including gold, silver, copper, copper, lead, and porphyry stones. Its yield of bullion in 1860 was about $16,500,000; in 1874, $4,000,000. It is exceedingly well watered, the chief rivers being the Missouri and Yellowstone, with their affluents, and the Columbia. Montana is well adapted for grazing. Pop. '70, 20,595, besides 22,486 tribal Indians.

MONTANA (river), a territory of the United States formed from parts of Idaho and Dakota; pop. '80, 39,157—27,642 of American birth, 3,689 colored, 1737 Chinese, and 1750 Indians and half-breeds. Its surface is rough and mountainous, the main range of the Rocky mountains entering the w. portion from the n., and extending 200 m. s. c. in that section; whence changing their direction and trending toward the w. boundary, where they form a high mountainous region. This mountainous region constitutes about two-fifths of the surface, extending the entire length of the territory from n. to s., and for 175 m. c. of the w. boundary, the general elevation being much less in the n. than in the s. portion. Between these ranges are deep divides; around the spurs wind beautiful rivers and picturesque canons separate the buttes. In the s. portion, in the vicinity of the Yellowstone river, the mountains rise 11,000 ft. above the level of the sea, wearing a crown of perpetual snow, and in the n., beyond the Missouri, the mountain tops in early autumn are clothed in the blue of the sky, mingled with the purity of the snow, visible for many miles over level, treeless plains. Away from the strictly mountainous portion there are solitary peaks of basalt, tuff, and other volcanic rock, of material such that though presenting a rocky appearance, or one of great solidity, much of it can easily be cut with a knife. In the crevasses of the mountains, however, may be found green spots bearing pine, cedar, and fir trees, and susceptible of cultivation, while the light-brown grass of the plain below, brown by contrast with the vivid green of the moister soil, furnishes nutritious food for the wandering herds marked with the ranchman's brand. A large proportion of this vast territory is taken up by Indian reservations, or lying between the spurs where more than 10,000,000 acres are thought to be tillable land, and only 3,769 acres is under cultivation. Immense prairies and bottom-lands, smooth, rich, and green, await the plowman, untilled and unhabited. The print of the pony's foot is the only mark on the soil, save the traces of a vanished "tepee," or the high stakes supporting the canvas shelf which holds the rattling bones of a dead Indian in his airy sepulcher.

The territory contains the head-waters of the Missouri, the Clarke's fork of the Columbia river, and the Yellowstone, a tributary of the Missouri, giving its name to the celebrated national Yellowstone park, which it irrigates and beautifies. These rivers and their branches permeate the entire territory, furnishing navigable highways for the transportation of passengers and freight. Of the branches those of the Missouri are all of more or less interest on account of their association with late Indian troubles. The Bill of form, the Rose Bow, and Rose valley was the scene of Custer's last battle with the Dakotas under Sitting Bull, the Powder, Tongue, etc., flow into the Yellowstone, and the Marias, Milk, Muscleshell, Big Muddy, Judith, and Poplar rivers flow directly into the
Missouri. The Bitter Root river rises in the w., flowing n., sometimes in the latter portion called the Missoula. The Missouri, rising near Gallatin in the s.w., is formed originally of the Jefferson, Madison, and Gallatin rivers, and flows n.e. to Helena, following thence an e. course to Benton and the Dakota line. It is navigable by steamboats from April to September as far as fort Benton, 303 m. from the boundary line of Dakota, and efforts are being made to improve the bed of the stream as far as the falls between fort Benton and Helena. Government appropriations have been made for the building of dikes to keep the water in the channel, and more are confidently expected, as the traffic on the river is assuming weighty proportions. It is a difficult and tedious work, owing to the scarcity of material. The Yellowstone, rising in Yellowstone lake in n.w. Wyoming, is also navigable early in the season, and even so late as August, as far as the buffalo hunting grounds, 300 m. above its mouth. The Little Missouri crosses the s.e. corner entering the Missouri in Dakota.

In his geological construction the azyoic formations prevail in the w., and eastward first the Jurassic appears, next the cretaceous, and near the Dakota line the tertiary. Along the base of the mountains are beds of Jurassic and carboniferous rocks. Potsdam sandstone and brick-making clay are abundant, and there is some granite. Slate is found in large quantities in the placer-mining districts. In all sections the strata are much broken, and present formations of almost every geologic age. The plains, which at the mouth of the Yellowstone are 2,010 ft. above the level of the sea, rise gradually to 4,091 ft. at the base of the mountains, the elevation of the valleys varying from 3,000 to 5,000 feet. The cretaceous strata in the n. yield coal of the best quality, which is mined in the vicinity of Bannack, Helena, Virginia, Deer Lodge, and Benton, and there are evidences of its presence on the Missouri, Missoula, and Yellowstone. All kinds of coal beds are found near the Missouri, snails, snakes, sea-serpents, buffaloes' bones, wood, etc. Its most important mineral wealth is in its vast deposits of gold and silver, which are mined in every method from the modern scientific machinery of quartz-crushing and hydraulic mining, to the homely pan of the original "honest miner," with his little retort and emery, quick-silver and rough sluice-boxes, vexed and worried by drought and flood. Gold was first discovered on a small creek w. of the main divide of the Rocky mountains, in 1852, contiguous to the site of the present town of Deer Lodge. In 1861 the first mine was opened, and in 1863 the first quartz mill was erected. The principal quartz mines are near Argenta, Bannack, and Helena, and the latter place and Virginia are the great mining centers. The Barker silver mines, 60 m. from Fort Benton, have been recently opened, and large quantities of ore were sent down the river to Omaha to be assayed in the autumn of 1889. Iron and coal, lignite, copper, and petroleum are found.

In the e. section there is much controversy as to which is the more susceptible to cultivation, the bench or the bottom lands, experiments having been made by the military and other residents along the rivers; but, subject to certain conditions of season and locality, either level has been found to be productive, furnishing excellent wheat land, and fine crops of turnips and the hardier vegetables are raised with very little labor. Groves of cottonwood, resembling the birch trees of the east, ash, and hickory grow on the banks of the Missouri, furnishing fuel for the steamers, being cut by a solitary woodman, and laid ready in long piles. It also supplies a convenient medium of exchange whereby the proprietor of the wood-yard procures his whisky, canned vegetables, and clothing. Thickets of willows are common, in which the tourist searches, frequently with success, for "diamond willow," the favorite wood for walking-sticks. At the Coal Banks, 55 m. from Fort Benton, a new government freight station, there is an elegant park laid out in serpentine paths, and furnished with rustic seats by the industry of the soldiers in leisure hours. Previous to the severe winter of 1881, the bunch, buffalo, and grama grass were sufficient food for stock throughout the year, and it was not considered necessary to provide shelter, but in that year the snow blocked all the roads for weeks at a time, cutting off all communication between principal points, and the thermometer registered 59° below zero at Fort Benton. Poor cottonwood sold at $15 per cord, and coal was 1 ct. per lb. In ordinary times a military telegraph gives all the facilities for rapid communication as far n. as Fort Benton. The climate is subject to great variations; in a journey of 150 m. a traveler may start in a linen duster and arrive in a fur coat, and a November sun shines with as much intensity as in July. Hay is made on the river bottom lands and carried into the interior, but little is required, except at the forts, and barns are little needed, the hay being stacked on the open prairie. Untoward circumstances have conspired to cause the failure of crops in certain seasons, but in the w. the Prickly Pear, Gallatin, and Bitter Root valleys, and in the n. the valleys of the Teton and Sun River valley present a region unsurpassed for agricultural advantages. In the Bitter Root valley, called the Garden Valley of Montana, splendid apples (which sold at Fort Benton in 1880 for 30 cts. per lb.) and plums are raised, $200,000 worth of trees being imported annually from New York nurseries. Potatoes are raised weighing 2½ lbs., 9x10 in. in size. This is a pleasant prospect for the country, the n. and e. depending principally on canned vegetables from the states. The valley lying n. and s. of Fort Owen is 3,384 ft. above the level of the sea, and is 80 m. long, varying from 5 to 10 m. in width. The soil is a rich dark loam. In addition to the main stream, many tributaries flow down from the mountains. Cottonwood and pine trees grow to a height,
The Missona valley is 15 m. wide for 30 m., is well wooded, and has a moderate climate. Prickly Pear valley, from 5 to 15 m. wide and 20 m. long, with beautiful smooth meadows, is in the vicinity of Helena. The valley of the Teton is from 2 to 6 m. wide, with bordering table-lands 55 ft. above the valley level, and is within easy distance of Fort Benton. Deer Lodge valley is 5,000 ft. above the level of the sea, and is 40 m. long and about 12 m. wide, with a central stream flowing through it, and rivulets running down from the mountains on either side. Sun River valley is from 1 to 3 m. wide. The stream is rather swift, and from the crossing, on the road from Fort Benton to Helena, the valley is about 5 m. wide for 25 miles. The timber is cottonwood and ash. The Judith basin is 50 m. wide and 80 m. long, and is traversed by the Judith River and 3 tributaries, West Fork, South Fork, and Big Spring creek. In the area between these valleys are extensive cattle ranges, taken up by residents of the towns, and visited semi-annually. The bright-winged grasshopper, gay and harmless, is found skipping about on the plains, resembling the little butterflies of the states. Butter is found to be the most lucrative product of the farm: 150 lbs. a week were made in 1880 by the owner of from 40 to 60 cows. It sold at 50 cts. per lb. Prices for the necessaries of life approach nearer to those of the east than they did in Virginia City in 1861, when flour sold for $100 in gold per sack of 100 lbs. The pay of laborers on ranches is $55 a month; in the winter $30. Timber is most abundant in the n.w., particularly along the Flathead and Kootenay rivers.

Aside from the fascination of the gold and silver mines, which draws the prospector thereafter, the natural scenery of this territory attracts the tourist who seeks a new sensation. The Utah Northern railroad is creeping slowly but surely from the Union Pacific into the heart of the mining district, to Dillon and beyond, and millions of dollars' worth of freight lies at the terminals awaiting transportation, while in the season steamboats, some owned by the government and carrying the U.S. mail, others owned by private parties (some of them realizing a profit of $200,000 in 10 years), crowded with freight and passengers, steam up the Missouri from Bismarck, D. T., to Fort Benton, stopping at the Indian agencies of Poplar Creek, the inhabited point nearest the British Possessions, Wolf Point, Fort Berthold, and Fort Buford, in their simious course parting company with steamboats which go up the Yellowstone, the point where the rivers divide resembling the separation of the Monongahela and Alleghany rivers at Pittsburgh. In ascending the river numerous abandoned forts are passed, and trading-posts and Indian encampments. Under the banks, which rise from 300 to 800 ft. above the level of the river, the boat may tie up for the night. The scenery is extraordinary; it is grand rather than charming. It silences, hushes, commands admiration; it is after awhile monotonous, but never trivial. These towering heights, these frowning parapets and stern dividing walls, are scarcely more enduring than the drifting sand-bars in the river's bed. They crumble and form again by the action of the atmosphere, slowly vanishing monuments of distant ages. Above the Yellowstone the river is narrow but the scenery is more varied, forming itself into castles and mediaval architecture. At Fort Benton coaches take the passengers into the mining region. The mouths of April, May, June, and July are the best to ascend the river; later the water is so low that much of the latter part of the journey must be by coaches. At any point on the river herds of buffaloes may be seen winding around the buttes or crossing the stream in the steamer's path. In June, 1880, between Fort Point and Paradise valley, it was estimated that 20,000 were seen in one day; on another day 500,000. Deer and antelope, black and white, are seen in the morning. The national park, at the head of the Yellowstone, which is partly in this territory, contains geysers, thermal and mineral springs; hot springs are also found s. of the Main Divide. Flathead lake, 30 m. long and 14 m. wide, lies in the n.w. portion, in the region of the Flathead and Bannack Indians. The Flathead river is its outlet. It has dense forests of heavy timber, pine, tamarack, and fir growing to the edge of the lake, except on the extreme n., which is open grassy prairie, with much tillable land.

Wolves are often met on the prairie; grizzly bears, badgers, mink, otter, and marten are found in the forests, and beavers build their cabins on the river banks. The Indians start on the annual hunt, with all their tribe and appurtenances, about the middle of October, and may be seen traveling for long distances over the plains, fording streams and climbing mountains. They tan the skins of buffaloes and trade them for whisky, sugar, flour, tea, and canned vegetables, and strip up the flesh into jerked meat, or chop it into pemmican for winter subsistence. Whitefish, salmon, and trout are plenty in the streams; bullocks, which resemble red caymans, grow by the rivers, and wild strawberries grow near Helena, ripening as late as November.

In the larger towns the manufacturing productions are rapidly increasing; the cost of transporting machinery, making the price of manufactured articles higher than that of the same articles imported from the states, has retarded the growth of industries, but flour, meal, lumber, jewelry, tinware, and bricks are largely manufactured, and malt liquors are made. The steam quartz mills, used principally for gold, and steam sawmills, are a good investment. Bricks and logs are used for building. Freight transportation, made with the Indians, and that which comes over the Canadian line, are the channels of commercial prosperity. Hardship and peril have accompanied the pioneer in mining, agricultural pursuits, gambling, or legitimate trade, and the transition from
the lawlessness which compelled the organization of the "Vigilantes," which administered justice without fear or favor, into a respect for individual rights, uninfluenced by sectional feeling, is slow and painful, but within a few years the most noted resorts of the border ruffian have become peaceful places of abode, and boards of trade have taken the place of gambling-houses.

There are several national banks, 2 having been established at Fort Benton in 1880, and a large number of private banking-houses. South of the Yellowstone is the reservation of the Crow Indians and the new Crow agency; in the w. are the Flatheads and Bannacks; in the n. and e. are the Blackfeet, Pend Oreilles, Gros Ventres, Assiniboins, Piegans, and Sloux, all of whom are friendly under certain conditions. Education, religious and secular, has as yet made only a beginning, but almost every settlement has a religious society, almost every village a newspaper, and nearly every town 2 or more churches. Missionaries are making great efforts to establish schools at the Indian agencies; they have 2 boarding schools and 4 day schools, and 1 will be opened by the Congregational denomination the present season at Poplar Creek. It is said that there are 142 professional scouts among the Montana Indians, but one of the most widely known and constantly employed, Wild Elk, is a Portuguese. Ministers of the Methodist, Roman Catholic, Episcopal, and Congregational order suffer great deprivation and fatigue in order to establish opportunities for religious instruction, and their efforts seem likely to be well rewarded. The Roman Catholics meet with great encouragement among the Indians, with whose language they make themselves acquainted. The professions are not represented, and find ample field.

The territory has over 50 public schools. It is organized into districts, and Deer Lodge, Virginia, and Helena have graded schools. Helena has a Roman Catholic convent of high reputation as a seminary for young ladies; there are also a number of private schools in the territory, and many libraries annually receiving large additions. The town of Helena was burned on Jan. 9, 1874, loss $850,000, but it has outgrown all ill effects of the calamity. Newspapers are published in 9 out of the 12 counties, in 7 county-seats, and in 11 cities, towns, and villages; aggregate circulation over 14,000.

The territorial government meets at Helena biennially, and consists of a governor, secretary of state, district attorney, surveyor general, superintendent of Indian affairs, and U. S. commissioner and treasurer, all appointed by the U. S. government. The delegate to congress is elected by the people, has a voice in the deliberations of that body but no vote; the county officers are elected by the people. The legislature consists of 2 branches, a council of 12 members, and a house of representatives of 26 members, all elected by the popular vote. The district judge of the U. S. district court and associate justices are appointed by the president of the United States. Its chief town is Helena; other important towns are Virginia City, Deer Lodge City, Fort Benton (commonly called Benton in recent years), Bozeman, Bannack City, Missoula, Diamond City, and Radersburg. The penitentiary is at Deer Lodge. Its counties are Beaver Head, Choteau, Custer, Dawson, Deer Lodge, Gallatin, Jefferson, Lewis and Clarke, Madison, Meagher, Missoula, and a new county, name unknown. It has 12 postal money-order offices, and 28 signal service stations. Capital, Virginia City.

MONTANELLI, GIUSEPPE, 1813-82; b. in Tuscany, and studied law in the university of Pisa, where he afterwards became professor of jurisprudence and commercial law. In the Italian revolution of 1848 he participated, and was for some time an Austrian prisoner. From that time until Tuscany became a part of Italy (1860) Montanelli took a very active share in the tumultuous political movements of the province, though for the greater part of the time compelled to remain outside its boundaries. He organized secret societies, wrote pamphlets and articles for the press, and in every way urged on the cause of Italian unity. He published his memoirs in 1853, wrote a number of lyric poems, and was the author of Garuma and adapter of an Italian version of Médée, both tragedies being performed with Mme. Ristori in the title roles.

MON TANISTS. See MONTANUS, ante.

MONTANUS, a celebrated heresarch of the early Christian church, was a Phrygian by birth, and made his first public appearance about 160 A.D., in the village of Ardabar, on the confines of Phrygia and Mysh. He was brought up in heathenism, but embraced Christianity with all the fanatical enthusiasm for which his countrymen were noted.

Montanus's standpoint was, in theory, the exact opposite of that occupied by the Gnostic sects; yet, in practice, it led to a similar exclusiveness and sectarianism. He believed in the constancy of supernatural phenomena within the church. The miraculous element, particularly the prophetic ecstasy, was not removed; on the contrary, the necessity for it was greater than ever. He considered those only to be true or perfect Christians who possessed the inward prophetic illumination of the Holy Spirit—they were the true church; and the more highly gifted were to be looked upon as the genuine successors of the apostles, in preference to the more outwardly consecrated bishops. Thus, they form a religious aristocracy, as arrogant as the Gnostics: the difference between the two simply being that the Montanists prided themselves on a kind of inflamed inspiration, and the Gnostics on a calm and serene illumination of the reason. Neither party wished to recede from the Catholic church, but rather to exist as an esoteric body within its pale. It was persecution, caused, no doubt, by their own insolent
obstinance, that forced them into a sectarian course. Montanus did not meddle directly with the creed of the church; in fact, he was not a thinker, nor a man of almost any importance intellectually. His efforts were confined to stirring up the Christians generally to fresh religious life—to a belief in a fresh outpouring of the Holy Ghost. At first, Montanus contended himself with predicting fresh persecutions, exhorting men to greater strictness and holiness of life, and announcing judgments to come upon the persecutors; but his idea of his own mission afterwards became more exalted, and he claimed to be in a very special sense a prophet of God—the organ chosen by the Holy Ghost to purify, enlighten, and advance the church. Among the things on which the Montanists laid stress, besides the idea of fresh persecutions, and the notion of martyrdom connected with these, and, indeed, flowing from these, was an aversion to second marriages, and to the restoration of the Lapsed (q.v.). Like other enthusiasts, they also were firm believers in the near approach of the millennium (q.v.) and in the personal advent of Christ. Two "prophets," Priscilla and Maximilla, were associated with Montanus in his work. A decree for the expulsion of Montanus and his followers from the communion of the Catholic church was issued by Eleutherus, bishop of Rome. The Montanists at once proceeded to organize themselves as a distinct sect. They found a singularly able apostle in Tertullian (who became a Montanist about 200 A.D.), and continued to exist till the 6th century.

MONTAUXUS, ARIAS. See ARIAS MONTANUS, sive.

MONTARGIS, a t. of France, department of Loir-et-Cher, is situated at the junction of the canals of Orleans and Briare with that of Loing, 40 m., c.n.e. of the city of Orleans. Montargis has some cloth and leather manufactures and considerable trade in corn, cattle, etc. Pop. 76, 9,175. In its vicinity is an extensive forest of the same name.

MONTAUBAN (Lat. Mons Albanus), a t. of France, capital of the department of Tarn-et-Garonne, is situated in a rich and beautiful country on a plateau between the rivers Tarn and Tescun, 32 m. n. of Toulouse. It is the seat of a bishop, has a fine cathedral in the Italian style, finished in 1739, built on the site of a still older monastery, the Mons Aureus (Golden Hill), and is a well-built, handsome town. Two houses are mostly of brick. Besides having considerable manufactures, it carries on a great trade in wine, grain, leather, etc. Montauban was founded in 1144 by count Alphonse of Toulouse, who was the founder of a bishop in 1317, embraced the reformation in 1522, and suffered severely in the civil wars that ensued. It has acquired historical celebrity as the great stronghold of the Huguenots. Protestantism still exists here, and maintains both an academy and a theological college. Pop. 76, 19,590, nearly one-half of whom are Protestants.

MONTAUK POINT, a promontory at the e. extremity of Long Island, in the state of New York. It is in the township of East Hampton, about 7 m. from Sag Harbor, in Suffolk county, lat. 41° 4' n., long. 71° 51' 54" w. It is a light-house station, with a fixed light (160 ft. above the level of the sea, in a stone light-house), and a fog horn. It was named for a tribe of Indians which, much reduced in numbers, inhabits the vicinity.

MONTBELIARD (Ger. Monopolgart), a t. of France, in the department of Doubs, 36 m., n.e. of Besançon. It lies in a valley between the Vosges and Jura mountains, is surrounded by an old château, now used as a prison, and carries on manufactures of cotton goods, hosiery, and silks. Clocks, watches, and agricultural implements are also made. Pop. 76, 7,025.

MONT BLANC, the highest mountain in Europe, and, according to the latest measurements, 15,781 ft. above the level of the Mediterranean sea, is one of the Grano Alpes, and is situated in the department of Haute-Savoie, France, close to the Italian frontier, and 37 m. s. of the e. end of the lake of Geneva. The vales of Chamouni and Montjollie lie on the w., and those of Ferret and Alée Blanche on the e. side of it. The waters which spring from its western slopes are drained off to the Arve, and thence to the Rhone, which rises on the e. side of the valley. The highest summit is a narrow ridge 50 yards by 16, called Le Bosse du Dronnaut, covered with firm snow, and very steep towards the north. In 1768 Sauvage offered a prize for the discovery of a practicable route to the summit of Mont Blanc, which was gained, in June 1786, by Jacques Balmat, a guide. Sauvage himself ascended the mountain the following year; and the same feat has since been performed by many, especially since Albert Smith published the well-known pictorial and dramatic description of his ascent in 1851.

MONTBRISON, a t. of France, capital of the department of Loire, 37 m., s.w. of Lyons, on the Vizey, a feeder of the Loire, stands at the base of a lofty and precipitous rock. In the vicinity are mineral springs. Pop. 76, 5,830.

MONTCLAIR, a co. in s. central Michigan; 729 sq. m.; pop. 80, 35,148—27,500 of American birth. The surface is undulating, and covered with a heavy growth of timber. The pine and the sugar maple abound. The soil is rich, and produces good crops of Indian corn, wheat, oats, potatoes, and grass. Other staples are wool, butter, and maple sugar. The manufacture of lumber is extensively carried on, and there are many saw-mills. Other manufacturing industries are boots and shoes, flour, sashes and blinds.

U. K. X.—11
and carriages. It is drained by the affluents of the Chippewa, Grand, and Muskegon rivers, and is traversed by the Grand Rapids and Indiana, Detroit, Lansing and Northern, and Saginaw Valley and St. Louis railroads. Co. seat, Stanton.

MONTCLAIR, a co. in s.w. Quebec, Canada, n. of the St. Lawrence river, watered by the North, Du Libre, Rouge, Lac Ouareau, and Gatineau rivers; 4,027 sq. m.; pop. 12,742—10,794 of French, 1557 of Irish descent. The surface is diversified and the principal productions are grain, cattle, and lumber. Co. seat, St. J ulienne.

MONTCLAIR DE CANDIAC. See CANDIAC, ante.

MONTCLAIR DE SAINT-VÉRAN, Louis Joseph, Marquis de, b. near Nimes, 1712; entered the army at the age of 14, at 18 was a captain, served in Italy and Germany for many years, and was wounded at the battle of Piacenza in 1746. He became a field officer in 1756, and was sent to Canada in May of that year to make head against the English. He captured fort Ontario at Oswego in August of the same year. The next season he forced the capitulation of fort William Henry at the head of lake George, with an English garrison of 2,500 men, capturing 42 guns and a large amount of stores. In 1758 he defended fort (Carillon) Ticonderoga with 3,600 Canadians, against gen. Abercrombie at the head of 15,000 English, which resulted in a bloody repulse of the latter after an attack of determined vigor. Lack of troops, ammunition, and provisions, and the large re-enforcements of the English, obliged Montcalm to retake all his forces the following year to the defense of Quebec, menaced by a powerful army under gen. Wolfe. The struggle for that stronghold began July 31, 1759, by an attack, which was repelled. Wolfe had conceived the plan of storming the English Works by scaling the cliffs above Quebec with his entire army, and on Sept. 13 appeared on the heights of Abraham in the rear of Quebec. Montcalm promptly prepared for battle in the open field, and at 10 o'clock led the attack in person. His troops, however, were not veterans and the English were. The English assumed the offensive. Wolfe fell dead in the moment of victory, and Montcalm was borne from the field mortally wounded. When told he must die he said: "It is well; I shall not live to see the surrender of Quebec." The city was not surrendered till several days after his death. In 1827 governor Dalhousie, of Canada, caused a monument to be erected in Quebec to the joint honor of the two brave generals who fell on the field where France lost and England won the Canadas.

MONT CENIS. See CENIS.

MONT CENIS TUNNEL. See TUNNEL, ante.

MONTCLAIR, a t. in Essex co., n.e. New Jersey, on the New York and Greenwood Lake railroad, and a branch of the Delaware, Lackawanna and Western; pop. '80, 5,146. It is 5 m. n.w. of Newark, and 13 n.w. of Jersey city. It has various manufacturing interests. It lies on the southern and western slope of Orange mountain, with fine view of New York, Brooklyn, and adjacent cities; has much rural beauty, and has attracted a refined and cultivated population.

MONT-DE-MARSAN, a t. of France, capital of the department of Landes, at the junction of two streams—the Midou and Donue—which, when united, take the name of Midouze, and join the Adour. It is 65 m. s. of Bordeaux, with which and with other places it is connected by railway. The town has of late years made great progress. It has a communal college and mineral warm baths. There are manufactures of common wooden cloths, blankets, sail-cloth, and leather. Pop. '76, 8,298.

MONT DE PIETTÉ, called in Italy Monte di Pietà, a charitable institution, the object of which is to lend money to the very poor at a moderate rate of interest. It had its origin at the close of the medieval period, when all such transactions were in the hands of usurers, to whom the necessities of the poor were but an inducement to the most oppressive extortion. The earliest of these charitable banks appears to have been that founded at Padua in 1491, which was so successful as to lead, according to contemporary writers, to the closing of the Jewish banks in that city. The first opened at Rome was under Leo X; and the Roman monti di pietà are confessed to have been at all times the most successful and the best managed in Italy. The institution extended to Florence, Milan, Naples, and other cities. The principle of all was to advance small sums on the security of pledges, but at a rate of interest barely sufficient to cover the working expenses. Should any surplus remain, it was to be expended for charitable purposes. The mont di pieté system was introduced also in Spain, France, Belgium, Germany, and the Netherlands. In 1873 there were in France 46 monts di pieté, making yearly loans of 60,000 francs. It formed the model of the loan fund board of Ireland, established by 6 and 7 Vict. c. 91. See Pawning.

MONT DE PIETÉ (ante). This institution originated with Francesco di Viterbo, a Minorite friar, in the 15th c., in Padua. He preached publicly against usurers, particularly the Jews, who had the most of that business in Europe; and though opposed even by some of the church orders, notably the Franciscans, he succeeded in inducing the pope to issue a bull in his favor, when opposition died out. The monk's plan was that the rich should combine to assist the poor, by lending them money without interest on pledges or pawns. The idea became popular, and the institution spread to Assisi, Mantua,
Parmo, Naples, and Rome, and soon these establishments gained a foothold in Germany, France, and Russia. They were known under different names: "Lombard houses," "mons piétis," "mons de piété," "banco di rovere," etc. In Rome, Gregory XIII. established a bank of deposit specially for widows and orphans, whose deposits were guaranteed by a lien on the goods of the bank. Sextus V. added to this permission to deposit goods and articles of any value and of every description. Soon this bank reached a height of wealth and power unexampled in the history of such institutions, and was frequently enabled to loan immense sums to states and sovereigns. In Turin the Jews held the money power, and 30 per cent was a common rate of interest among them. In 1519 a mon de piété was established there and the system of extortionate interest was broken up as a result. But this institution was unable to sustain itself, from the fact of charging no interest, and would have failed but that the commissaire de St. Paul came to its rescue with the suggestion of a charge of 2 per cent, on which basis it continued business with success. This establishment continued in existence until near the close of the 18th c., when it succumbed to the political convulsions of the period; it was, however, revived in 1822. The mon of Milan was formed by the union of 36 private establishments, and became one of the largest in Italy. It is now nearly 500 years old. In 1893 the capital of this establishment was 671,000 Austrian livres. Among the earliest mons in Italy was one at Cremona for lending corn at interest; it was called the mons frumenti piétis. The custom of charging interest, which has obtained among mons de piété ever since, was licensed in 1515, when the Lateran council in Rome decided that these banks could lawfully charge a sufficient percentage for the use of their money to governo French money. At Rome the charge was about 6% per cent a year; but the establishment has greatly increased in most of the Italian cities. When Napoleon entered Italy in 1796 he robbed the mons de piété of many valuable treasures. The establishment of mons de piété in France began in the latter part of the 17th c., the first one being at Marseilles in 1695. One appeared in Paris in 1726 in the reign of Louis XIII., but soon failed. In 1769 Turgot tried to re-establish it, but without success; and it was not until the period of Necker's financial administration that it became firmly fixed as a permanent institution. Five years after the establishment of this mon, there were more than 40,000 watches in its vaults. Next to the Paris mon, those of Lyons and Marseilles are rated most important. A mon de piété was established in Copenhagen, Denmark, in 1688, and flourished in private hands until 1753, when it was purchased by the naval hospital for 6,300 rix bank dollars: about $6,000. The rate of interest through- out the French mons de piété has been 6 per cent. The French government was opened at Madrid in 1703, and in 1773 an attempt was made to place it in the hands of the government, but without success. The capital of the mons of Valencia, Malaga, and Gabeza was at first derived from vacant benefices, termed espolios y vacantes. The two Russian mons were established in 1772—"to put an end to the devouring cupidity of the usurers, by offering prompt assistance to those who are so unfortunate as to be suddenly thrown into need." The income over expenses derived from these mons has been devoted to the support of the foundling hospitals, always an object of fostering care on the part of the Russian government. The rate of interest was originally 6 per cent, was afterwards doubled, and finally again reduced, this time to the legal rate. It has always been a Russian custom to deposit plate and other valuables with the mon for safe-keeping; and in 1813, when the French army marched on Moscow, the amount loaned by the establishment in that city was more than 50,000,000 rubles to the average sum. In 1817 the St. Petersburg mon lost by an earthquake more than $1,000,000. The mon of London was first established in Great Britain; one was opened in the city of Limerick, Ireland, in 1837, and was useful in annulling the condition of the poor while it lasted; but it did not become permanent, and the private pawnbroker has always occupied the field in the British Islands. There is no record of any institution of the character of the mon de piété having been established in the United States. The distinction between this institution and the ordinary pawnbroker's shop should always be sharply drawn; the one is a beneficent institution, designed to accommodate the poor in the first instance, and, after payment of expenses, to devote any surplus to the sustenance of some charity or public work; the other is simply a business enterprise, conducted for private profit. See Pawnbroker.

MONTEBELLO CASTEGGIO, a village of northern Italy, in the province of Pavia, 25 m. c.e.n. of Alessandria. It stands in a plain on the banks of the torrent Schizola. Here the Austrians were defeated by a French army under gen. Lannes, after a desperate conflict, June 9, 1800. The title of duke of Montebello was conferred on the victorious French general five years later. In May, 1859, the Austrians were again defeated here by the united armies of the French and Piedmontese. See Casteggio.

MONTE-CASINO. See Casio, Monte.

MONTE-CATINI, a village of Tuscany, situated on a spur of the Apennines, 29 m. w. of Florence, derives its name from the bowl-shaped hill on which it stands. It is of very ancient origin, and was formerly called Castello. In the close vicinity of the town are the famous mineral springs of the same name, in high repute for their curative properties, especially in diseases of the liver and digestion. Excellent accommodation can be had by visitors both in private establishments and those under government direction.
MONTECATINI DI VAL DI NIEVOLE, a t. in Italy, 20 m. e. of Lucca; pop. 6,791. Its mineral springs are much frequented by invalids, and have a high reputation throughout Europe.

MONTÉ-CHIARO, a t. of northern Italy, in the province of Brescia, situated on a height on the left bank of the Chiese, in the center of an amphitheater of hills. Pop. 6,963. The chief manufacture is silk. In 1796 the Austrians were defeated here by a French army.

MONTÉ CHRISTO, a small island, belonging to Italy, 26 m. s. of Elba. It consists of a mountain of granite 1893 ft. above the level of the sea, and is uninhabited except by wild goats and other animals. It is inaccessible except by one narrow landing-place. Monté Christo has given name to Dumas's well-known novel.

MONTECUCCULI, RAIMONDO, Count, b. near Modena, 1680, and entered the Austrian artillery as a volunteer under his uncle, Ernesto, count Monteucculi, in 1627. During the Thirty Years’ war he found many opportunities of distinguishing himself, received rapid promotion, and was employed in various services, military and diplomatic. In 1657, he was sent to support the king of Poland, John Casimir, against the Swedes and Rákóczy, which he did with great effect, compelling Rákóczy to make peace with Poland, and to break his alliance with the Swedes. In the following year he was made a field-marshall, and was sent to aid the Danes against the Swedes, in which also he was eminently successful. In 1660 he commanded the army sent to oppose the Turks, who had broken into Transylvania, and skillfully kept them in check till the arrival of the French army, whose assistance he won the great battle of St. Gotthard, on the banks of the Rea, Aug. 1, 1664—the first decided triumph of European tactics and discipline over the mere numbers and daring of the Ottoman hosts. When the war broke out between France and Holland, in which the emperor took part with Holland, Monteucculi received the command of the imperial army in 1672. He took Bonn, and notwithstanding the endeavors of Turenne to prevent it, effected a junction with the prince of Orange. In 1675 he was opposed to Turenne on the Rhine, and they spent four months in maneuvers in which neither could gain any advantage. After this campaign, Monteucculi spent the remainder of his days at the imperial court and in the society of learned men. He was himself a man of learning and various accomplishments, and has left works on the art of war, on the Turkish war, and on the war of 1644, and also sonnets. The emperor Leopold made him a prince of the empire, and the king of Naples bestowed on him the ducal of Modena. He lost his life by the fall of a beam as he was entering Linz with the imperial court, Oct. 16, 1681. His writings were published in the original Italian by Ugo Foscolo (2 vols. Milan, 1807); and by J. Grassi (2 vols. Turin, 1821). A semi-autobiographic memoir was translated into Latin, and published at Vienna, under the title of Commentarii Bellier, in 1718.

MONTEFIORE, Sir Moses, b. London, 1784; from a wealthy Jewish family of bankers; married, in 1810, a connection of the Rothschilds. In 1829 he visited Palestine, became interested in the Jews of that country, and then devoted himself to their benefit. He also assisted the Jews in Poland; and throughout his life has been in the conduct of plans for the amelioration of the condition of his race. In 1846 he succeeded in influencing the czar Nicholas in their behalf; and in 1863 obtained a firman from the emperor of Morocco which afforded protection to the Jews in his dominions. He endowed a Jewish college at Ramsgate, England, in 1867, in memory of his wife, who had died five years before.

MONTE GO BAY, a small but flourishing seaport on the n. coast of the island of Jamaica, 17 m. w. of Falmouth. It has a harbor protected by a breakwater, is defended by a battery, and carries on a general trade of some importance. More than 100 vessels annually enter and clear the port. Population variously stated at from 4,000 to 5,000.

MONTEGUT, Émile, b. at Limoges, 1824, and educated there. He was a student of law when his first step into the literary world was made by an article contributed to the Revue des Deux Mondes on the philosophy of Ralph Waldo Emerson. He soon afterwards became one of the editors of the review; his contributions ranging through light literature, foreign critiques, and politics, until 1848, when social and political subjects dominated, and were treated with little breadth of view. He soon resumed the study of English and American literature, and afterwards devoted his pen to contemporaneous French writings. From 1862 to 1870 he was associate editor of the Journal de Paris, and thereafter again editor of the Revue des Deux Mondes. His style is described as clear, trenchant, and of narrow view. He has translated into French Emerson's philosophical essays, with an introduction; Macaulay's history of England, and Shakespeare's works with commentaries and notes; and is author of a considerable number of original works.

MONTELEONE DI CALABRIA, a t. in Calabria, 15 m. n.e. of Nicotera; pop. 11,840. It is situated on a high hill, commanded by a castle; the streets are irregular, and the houses mostly of wood. There is a college, and 4 churches, which contain some good paintings. Silk is manufactured to some extent, and there is some trade, but the principal occupation of the inhabitants is tanning-fishing. The t. was founded in the 13th c., and stands near the site of the ancient Vibonium or Hippo.
Montealepre, t. in Sicily, 13 m. w. of Palermo. Pop. 5,706. It contains a fine feudal castle, and many rare Phenician and other ancient coins are found near it.

Montelimar, an ancient t. of France, in the department of Drôme, about 2 m. from the left bank of the Rhone, and 26 m. s. of Valence. It stands on the slope of a hill covered with vineyards. There are factories for silk and cotton goods, tanneries, etc. Pop. '72, 7,377.

Montem Custom was a triennial procession of the Eton boys, on Whit-Tuesday, to a certain mound (ad Montem) known as the Salt hill, near the Bath road, and which was doubtless so called because certain of the boys levied tribute (for salt as the phrase went) from every person present, and even from any chance passer. These juvenile tax-gatherers were attired in fancy dresses of silk. The king and queen, besides many members of the nobility, frequently honored the procession with their presence; and on such occasions, as much as £1000 has been collected, which was given to the senior scholar to support him at Cambridge. The origin of the custom is unknown. It was discontinued in 1847.

Montenegro (an Italian translation of the native name Czernagora, "Black Mountain") is a small but independent and recently extended principality situated between Bosnia and Albania. Till 1878 it was separated from the Adriatic by a narrow strip; now it touches the coast for a short distance at Antivari, its only port, which is closed to the navies of all nations—Montenegro being prohibited from having war-ships. Montenegro contains above 2,000 sq. m., and is everywhere mountainous, the mountains being in most cases clothed with dark forests of fir, ash, beech, oak, ilex, willow, and poplar. Mt. Dormitor, in the n., is 8,200 ft., and Mt. Kom, in the e., 8,000 ft., above sea-level. Agriculture is prosecuted to the utmost extent the country will admit of, but in a rude and primitive manner. The products are those of other European countries in the same latitude. Few oxen are reared, but sheep, goats, and swine abound.

There are no towns in Montenegro save in the recently conceded portion: of them, Podgoritza (pop. 7,500) and Antivari (pop. 3000) are the only ones worthy of mention. Cettigne or Cetinje, the seat of government, contains above a hundred houses, many of them well-built, besides a convent and the palace of the prince of Montenegro. The villages are unwalled; the houses, or rather huts, which compose them, are rarely provided with chimneys, and in the elevated districts are more wretched in appearance than even the mud hovels of Ireland.

The Montenegrins or Tzernagorzes are Slavs of the Servian race, and number about 130,000. They are knit together in clans and families, and have many feuds amongst themselves, which are perpetuated by the hereditary obligation of avenging blood. Their chief occupations at home are agriculture and fishing, but they are ever ready for war or pilage. Education among them is at a very low ebb; in fact, it is held in contempt, and many, even among the priests, are unable to read or write. In 1841 several schools were established, and the art of printing introduced; but the unsettled state of the country has hitherto prevented much improvement. Their language is a very pure dialect of the Slavic. They belong to the non-united Greek church. In 1871 the first newspaper in Montenegro was established.

Political Divisions and Government—Montenegro is divided into the districts of Montenegro proper, and Brda or Zeta, each of these being subdivided into four "unions" or departments, and these are further subdivided, each subdivision having its own hereditary chief. Besides, there are the newly added territories, not yet organized. Until 1851 the head of the government was the vladika ("metropolitan," or "spiritual chief"), who, besides his proper office of archbishop and ecclesiastical superior, was at the same time chief ruler, lawgiver, judge, and military leader. This theocratic administration began (1697) hereditary in the Petrovitch family, but as the vladika cannot marry, the dignity was inherited through brothers and nephews. Since 1851 the two offices have been disjoined, and the vladika is restricted to his ecclesiastical office, while the cares of government devolve upon the "gosподar" ("hospodar") or lord, though the common people still apply to him the title "svet gospodar," which properly belongs to the vladika alone. The vladika Petrovitch (1826-51) established a senate of twelve members and a council of five chiefs, which ruled the country, and in this body the executive power was vested. Next to the vladika in ecclesiastical affairs is the archimandrite of the convent of Ostrog. The other public officers, as the secretary of state, the chamber, and the local judges, are appointed by popular election. From time to time an assembly of all the adult males of the country takes place in a grassy hollow near Cetigne, the capital: but the powers of this assembly are very undefined. For defraying the expenses of government, taxes are levied on each household, the income thus raised amounting to 40,000 Austrian florins, or £3,068. Besides this the prince receives from Russia a subsidy of 8,000 ducats (£3,735), and from Austria 20,000 florins (£2,000). As the Montenegrins, even when engaged in agricultural operations, is always armed with rifle, yatahann, and pistols, an army of 30,000 men can be summoned on the shortest notice, and in desperate cases 14,000 more troops can be raised. Their intense love of independence and heroism in the defense of their country, is worthy of the highest respect; but out of their own country they are savage barbarians, who destroy with fire and sword everything they cannot carry off.
Montenotte. Montespan.

There is little trade in Montenegro, yet hides, wool, venison, dried and smoked fish, mutton, and goat flesh, bacon, lard, etc., are exported in considerable quantities. These goods are carried to Cattaro by the women, aided occasionally by males, for, owing to the absence of roads (a precaution against invasion), carts are unknown. Austrian and Turkish coins form the currency, as Montenegro has no mint of its own.

History.—Montenegro belonged in the middle ages to the great Servian kingdom, but after the dismemberment of the latter, and its conquest by the Turks at the battle of Kosovo (1389), the Montenegrins, under their prince, who was of the royal blood of Servia, maintained their independence, though compelled to relinquish the level tracts about Scutari, with their chief fortress of Zabljak, and confine themselves to the mountains (1485). In 1516 their last secular prince resigned his office, and transferred the government to the vladika. The porte continued to assert its claim to Montenegro, and included it in the pashalik of Scutari; but the country was not conquered till 1571, and only then for a brief period. The Turks soon withdrew; it resumed its independence. In 1710 they had sought and obtained the protection of Russia, the czar agreeing to grant an annual subsidy on condition of their harassing the Turks by inroads, and this compact has, down to the present time, been faithfully observed by both parties. Another part of the agreement was that the bishop or vladika was to be consecrated by the czar. In 1796 the prince-bishop, Pietro I., defeated the pasha of Scutari, who had invaded Montenegro, with the loss of 30,000 men; and for the next quarter-century we hear no more of Turkish invasions. The Montenegrins rendered important aid to Russia in 1803 against the French in Dalmatia, and took a prominent part in the attack on Ragusa, the capture of Cuzzola, and other achievements. Pietro II., who ruled from 1800 to 1831, made great efforts to civilize his people, and improve their condition. He established the senate, introduced schools, and endeavored, though unsuccessfully, to put an end to internal feuds, and predatory expeditions into the neighboring provinces. Separate wars, however, between the Montenegrins and the Turks continued for another generation or two. In 1840 a dispute with Austria regarding the boundary resulted in a war, which was terminated by treaty in 1840. In 1851 the last prince-bishop died, and his successor, Danilo I., separated the religious from the secular supremacy, retaining the latter under the title of gospodar. This step caused the czar Nicholas to withdraw his subsidy (which was renewed, and the arrears paid, by the czar Alexander II.), and the imposition of taxes thus rendered necessary caused great confusion. This was taken advantage of by the Turks, who, under Omar Pasha, invaded the country; but the intervention of the great powers compelled a treaty, Feb. 15, 1853. Danilo went in vain to the Paris conference in 1857, seeking the recognition of Montenegro as independent. In 1860 the Montenegrins excited an insurrection against the Turkish rule in the Herzegovina, which was soon suppressed, and in return they were so hard pressed by the Turks that they were glad to agree to a treaty (1862), by which the sovereignty of the saline porte over Montenegro was recognized. Fresh complications caused Montenegro to declare war against Turkey in Jan., 1875, but a compromise was effected. Montenegro, however, supported the insurrection against Turkey that broke out in the Herzegovina a little later, and in July, 1876, was again at war. The Montenegrins co-operated with the Russians against their hereditary enemy during the war of 1877-78; and the Berlin conference (1878) recognized the independence of Montenegro, and agreed to an important extension of Montenegrin territory.

MONTENOTTE, a small village of northern Italy, 26 miles w. of Genoa, where the Austrians were defeated by the French on April 12, 1796.

MONTEPULCIANO, a city in Italy in the province of Siena, situated on a high hill, s.s.e. of Florence. Pop. about 3,000. Numerous Etruscan remains have been excavated in the neighborhood. The wines of Montepulciano are famous.

MONTEREAU, a t. of s. Italy, in the province of Aquila. Pop. 5,014. It stands on a hill in the midst of a vast plain, and has several elegant churches. There are vast chestnut-groves near Monterea, which furnish the poor inhabitants with the chief article of their subsistence.

MONTEREAU, a t. of France, in the department of Seine-et-Marne, at the confluence of the Seine and Yonne, 46 m. s.e. of Paris, with which there is communication by steamboat. The manufactures are earthenware and leather. Here, in 1419, Jean- sans-Peur, duke of Burgundy, was assassinated, at the instigation and in the presence of the dauphin, afterwards Charles VII.; and in the immediate vicinity Napoleon, Feb. 18, 1814, gained his last victory over the allies. Pop. '76, 6,847.

MONTEREY, a co. in w. California, between the coast range of mountains on the e. and the Pacific ocean on the w., drained by the Salinas, Carmel, and Benito rivers, and crossed by the Southern Pacific railroad; 4,556 sq. m. in 1874; pop. '80, 11,302—8,637 of American birth. The surface is intersected by several California ranges, and divided into the three great valleys of the Carmel, Benito, and Salinas. It is sparsely wooded except in the w.; along the coast fruit raising and cattle raising are extensively pursued. The great staples are wheat, barley, and wool. Next in importance are cheese, butter, and peas and beans. San Benito county was set off from the e. part of this county in 1870. Co. seat, Salinas.
MONTEREY, a village in Monterey co., Cal., 84 m. s.e. of San Francisco, on the Monterey and Salinas Valley railroad. Pop. 75, 1112. It has a good harbor, and a line of steamers plies between it and San Francisco. It was the capital of the Mexican province of California, and is now the co-seat of Monterey county. It gives name to a Roman Catholic diocese.

MONTEREY, the most thriving city of northern Mexico, capital of the state of Nuevo Leon, on the San Juan, a tributary of the Rio Grande, 175 m. w. of Matamoros. It is well paved and clean, stands on a broad plain, 1026 ft. above sea level, and is surrounded by beautiful gardens and orchards. Pop. in 1869, 13,500. From its situation its facilities for commerce are great; and it is the entrepot for the transport of American goods from the Rio Grande to the inland states of Durango and Zacatecas. In the war between the United States and Mexico, Monterey capitulated, Sept. 24, 1846, after a siege of four days, to the American forces under gen. Taylor.

MONTEREY, Battle of, occurred in the beginning of the war between the United States and Mexico, and is so named from the Mexican city before which it took place. General Zachary Taylor, who had occupied Matamoros on May 18, 1846, and had there been re-enforced, marched southward along the main highway into the interior, and sat down before Monterey, the key of the northern provinces of Mexico, on Sept. 9, with about 6,500 men. The city was strongly fortified, and garrisoned by about 10,000 Mexicans under the command of gen. Ampudia. The bishop's palace, standing on an eminence w. of the town, had also been fortified, and the position was esteemed difficult of capture, if not impregnable, so small a force as was comprised in gen. Taylor's army. The attack was opened on the part of the Americans on Sept. 21, and on the following morning a sharp assault was made on the bishop's palace by general Worth's command. That position being taken, after a stout resistance, the city was forced, and a fierce running fight ensued, the Mexicans resisting stubbornly, as the Americans drove them from square to square, to the center of the city. The battle lasted two days, but on the 24th, gen. Ampudia surrendered the city and garrison. This being the first success of the American arms, and being achieved under peculiar disadvantages of relative position and number of men, greatly encouraged the United States soldiers, and stimulated them to renewed daring, while it was viewed by the American people as auspicious of a successful conclusion to the war.

MONTES ROsA, the Mons Sylvius of the ancients, is the highest mountain in Europe after Mont Blanc. It is situated in the angle where the w. end of the Pennine meets the Lepontic Alps, and separates the canton of Valais from Italy. The northern portion of the mountain is highest, and forms nine peaks, the highest of which is forked and precipitous, and attains an altitude of 15,210 feet above sea level. Many attempts were made to ascend this peak, but none were successful till 1855. The mountain appears to consist of mica-slate, in some places alternating with gneiss. It is rich in metallic ores, and several mines of gold, copper, and iron are worked. The highest mine is between 10,000 and 11,000 feet above sea-level, and in the region of perpetual snow. Rye ripens up to an elevation of 6,000 feet, and the vine is found as far up as 3,200 feet; but there is a difference of nearly 1000 feet in the altitude of the corresponding vegetation on the n. and s. sides.

MONTES SAN GIOVANXI CAMPANYA, a t. in Italy, in the province of Rome, s.e. of Frosinone; pop. 5,988. It occupies a commanding situation on a hill, and contains many well preserved, medieval edifices. It was once a fief belonging to the house of Aquinav, and the prison of St. Thomas is still pointed out to visitors.

MONTES SAN GIULIANO, a t. of the island of Sicily, province of Trapani, situated on a high mountain 4 m. c.n.e. of the town of Trapani. On the mountain (anciently Erige) are the remains of a once famous temple of Venus. Pop. 6,250.

MONTES ANTelo, a city of southern Italy, in the province of Foggia (formerly Capitanata), 28 m. n.e. of Foggia. It stands on one of the Gargano group of hills, at a height of 2,790 ft., and has numerous fine churches. It is famed for its exquisite honey, gathered from the odoriferous alpine plants of the mountain. Pop. 14,936.

MONTES SARCHIO, a t. of southern Italy, in the province of Benevento, 13 m. n.w. of Avellino, on the torrent Correo. Pop. 5,600.

MONTESUNOS, FERNANDO, about 1600-52; b. Spain; went to Peru while a youth, and eventually became a member of the supreme administrative council at Lima. While employed in this capacity he studied the history and archaeology of the country, and wrote Memorias Antiguas Históricas del Peru, which was translated into French in 1849 by Ternaux-Compan. Prescott, the historian, speaks of him as a writer "who shared largely in the credulity and love of the marvelous which belong to an earlier and less enlightened age."

MONTESPAN, FRANCOISE ATHÉNAIS DE ROCHECHOUART DE MONTMART, Marquise de, 1641-1707; second daughter of the first duke of Rochefoucault. She received a good education at a convent, and appeared in society first under the name of Milc. de Tonmay-Charente, the name of the château where she was born. Beautiful, witty, and fascinating in conversation, she was soon chosen one of the ladies in waiting of the court of Versailles,
where she became a companion of Mlle. de Vallièrè, who occupied the same position, and was mistress before her of Louis XIV. She married the Marquis de Montespan in 1668, by whom she had a son. It was the queen who was first so fascinated by the charm of her manner that she called the Marquise to be her companion. In 1668, when her age was 27, the monarch openly recognized both her and Mlle. de Vallièrè as mistresses, and his queen seemed not the less fond of them. Montespan, who was by far the most powerful and ambitious of the two, maintained for ten years a strange control in state affairs, and retained the joint affections of king and queen; often appearing on state occasions in the carriage with the latter. She was admitted by all to be the most beautiful lady of the court. An abundance of fair blonde hair, expressive blue eyes, dark eyebrows, a complexion of exquisite delicacy, a form full and graceful, and "an air that lighted the spot where she appeared," was the inventory of her personal attractions. Her charms as she acquired power became violent and changeable, and her influence declined. During the ninth year of her liaison, Mme. de Maintenon, who was in the service of Montespan as governess of her son, and whose more gentle temper pleased the king, began to supplant her, so that in 1679 the king no longer was under her influence. She retained her place at court till 1691. In 1700 she met the king for the last time at court, and soon afterward followed the fashion of the time and became a religious devotee; but not until she had written a tender letter to her husband, begging him to allow her to return to him, and had been refused. By the king she had two sons, the duc de Maine and the comte de Vexin; three daughters, who lived to marry men of title; and two that died infants.

MONTESQUIEU, CHARLES DE SECONDAIT, Baron de la Brède et de, one of the most celebrated authors and political philosophers of France, b. Jan. 18, 1689, at his father's château of Brède near Bordeaux, and descended from one of the most distinguished families of Guienne. In his youth he was a hard student of jurisprudence, literature, and philosophy. His love of the classical authors was so great that at the age of twenty he composed a work intended to show that they did not deserve eternal damnation for being pagans. In 1714 he was appointed a councillor of the parliament of Bordeaux, and two years after, president of the parliament. His first (published) work was his famous Lettres Persanes (Par. 1721), in which, in the character of a Persian, he ridiculed with exquisite humor, and clear, sharp criticism, the religious, political, social, and literary life of his countrymen. Although he did not spare the academy in these Lettres, he was admitted a member of it in 1728, and would have been admitted sooner if Cardinal Fleury had not objected on the ground of his jests against religion. In 1726 Montesquieu resigned his office in the parliament of Bordeaux, and spent some years in foreign countries. In England he spent two years, during which he was much in the company of Lord Chesterfield, and was treated with the greatest respect by the most distinguished personages. After his return to Brède, he published his Considerations sur les Causes de la Grandeur et de la Décadence des Romains (Par. 1754), a masterly review of Roman history, expressed in a sententious, oracular, and vigorous style. It was followed, after a long interval, by his Dialogues de Sylvestre et de Lézimaque (Par. 1748), published under an assumed name, in which the motives and feelings of a despot are skilfully analyzed. In the same year appeared his great work, on which he had been engaged for twenty years, the Lettres de Montesquieu à M. de Chastellux (2 vols., Geneva, 1748), in which it was attempted to exhibit the relation between the laws of different countries and their local and social circumstances. It was immensely popular. No fewer than twenty-two editions were published in eighteen months, and it was translated into various European languages. The Esprit des Lois is a wonderfully good book, considering the age in which it appeared. Without adopting Voltaire's hyper-critical criticism, that "when the human race had lost their charters, Montesquieu rediscovered and restored them," it may be said that it was the first work in which the questions of civil liberty were ever treated in an enlightened and systematic manner, and to Montesquieu, more than to any other man, is it owing that the science of politics has become a favorite subject of study with the educated public. Montesquieu died at Paris, Feb. 10, 1755. The collective editions of his works are numerous, amongst which may be mentioned the complete and careful ones by Auger (8 vols., Par. 1809), by Destutt de Tracy and Villenau (8 vols., Par. 1827), by Lefebvre (2 vols., Par. 1839), and by Hachette (2 vols., 1865).

MONTEVIEDO, SAN FELIPE DE, the capital of the republic of Uruguay, in South America, is situated on the shore of the estuary of the Rio de la Plata (which is here 60 m. wide), and 132 m. e. by s. from Buenos Ayres. It stands on a small peninsula, and is surrounded by a wall and fortifications. The houses are mostly of one story, with flat roofs. The only public buildings worthy of notice are the cathedral and the town-hall. The climate is healthy; but as there are no rivers near the town, and the water is only obtainable from wells, or by collecting rain-water in cisterns. The bay or harbor, which is about 31 m. long by 2 broad, presents excellent facilities for building wharfs, docks, etc., is sheltered from all but the s.w. gales, and averages 16 or 17 ft. in depth. The trade of Montevideo is extensive: the exports consisting of wool, hides, hair, tallow, salt and dried beef, bones, etc.; and the imports, of cotton and woolen fabrics, hardware, also flour, wine, spirits, and other provisions. The chief trade is with Great Britain. Montevideo has steam communication with the United States, Rio Janeiro, Britain, and Genoa, and besides these, carries on a considerable trade with France, Spain,
La Plata, and Italy. The population in 1862 (inclusive of the small suburbs of Cordon and Aguada) was 45,765; and in 1872, 105,296. In 1871, 1502 vessels, of 739,607 tons, entered and cleared from the port. The imports for 1872 amounted to about £3,500,000; and the exports to about £3,000,000. For the history of Montevideo, see URUGUAY.

MONTEZUMA, the name of two of the emperors of Mexico.—Montezuma I., the most able of the Mexican emperors, ascended the throne about 1457, and soon after commenced a war with the neighboring monarch of Chalco, which resulted in the annexation of that kingdom to Mexico. Tlatelolco, Cuitlique, and Tzompahuanac were next annexed. Some reverses, which his arms now suffered led to a confederacy of the Indians and two other powerful tribes against him; but in the war which followed Montezuma's arms were again signaliy triumphant, and the territories of the conquered tribes increased the domain of the now all-powerful Montezuma. After several other successful wars, he died in 1471.—Montezuma II., the last of the Mexican emperors, before its subjugation by the Spaniards, succeeded to the throne in 1502. He had distinguished himself as a warrior during the reign of his predecessor, and after his accession, carried the terror of his arms to the frontiers of Nicaragua and Honduras. He was at the same time a member of the priestly order, and did not dextr his functions on his accession. He devoted his chief attention to the improvement of the laws, and of the internal administration, and displayed his taste for pomp and luxury by the magnificence of his household arrangements, and a profuse embellishment of his capital. This necessitated heavy taxation, and led to the strictness and severity of his administration, which caused continual revolts among his subjects, especially those who had lately come under his sway. When Cortes landed in Mexico with his small army in 1519, Montezuma, blinded by an old prophecy, and by the strange appearance of the invaders, acknowledged them as beings of a superior order, and as his masters (see Cortes). The inhabitants of Mexico having risen against Cortes, the latter caused Montezuma, who was then his prisoner, to appear in order to pacify them; but being wounded accidentally by a stone flung from amongst the crowd of his own subjects, he so keenly felt the indignities which he had suffered, that he repeatedly tore the dressing from his wound, and soon after died, June 30, 1520. Some of his children adopted the Christian religion, and his eldest son received from Charles V. the title of count of Montezuma. One of his descendants was viceroy of Mexico from 1697 to 1701. His last descendant, Don Manuel de Teruel, count of Montejuma, was banished by Ferdinand VI., and afterwards from Mexico on account of his liberal opinions, and died at New Orleans in 1836.

MONTFACQON, Bernard de, 1655-1741; b. Languedoc, of noble family. Educated for a military life, but ill suited to it, he joined the Benedictine order in 1676, studied till 1687, and was then called to Paris, where his profound knowledge of Hebrew and Chaldaic brought him an appointment to study the libraries of France and Italy in the interest of church history. In Italy he found trouble with the Jesuits, and asked his own recall, on the ground that it was useless " to follow up a dogmatic controversy with such great heirs as the Jesuits." His numerous works are mostly in Latin.

MONTFERRAT, formerly an independent duchy of Italy, between Piedmont, Milan, and Genoa, now forming part of the kingdom of Italy. It consisted of two separate portions, Casale and Acqui, lying between the maritime Alps and the Po, and having an area of over 1300 sq. miles. The capital was Casale. Montferrat, after the downfall of the Frankish empire, was ruled by its own margraves till the beginning of the 14th century. This illustrious house for a long time disputed the sovereignty of Piedmont with the house of Savoy, and sent to the crusades more heroes than any other sovereign house in Europe. Members of the family ruled simultaneously in Montferrat, Thessaly, and Jerusalem. On the death of the marquis John I., in 1306, his sister, Isabelle or Irene, who was empress of Constantinople, succeeded to Montferrat; and her second son became the founder of the family of Montferrat-Palaeologus, which became extinct in 1553, and Montferrat passed to the Gonzagas of Mantua. In 1415, the duke of Savoy obtained possession of a portion of Montferrat, and in 1703, with the consent of the German emperor, the remaining portion passed under their sway, and was incorporated with their own dominions.

MONTFORT, the name of a noble French house, descended, according to the most probable opinion, from Baldwin, count of Flanders, and Judith, daughter of Charles the bald. Amaury 2d, seigneur de Montfort (a little town between Paris and Chartres) is the first of the family mentioned in history. He lived in the first half of the 11th century. His son, Simon 1st, had for his third wife Agnes, daughter of Richard comte de Evreux. He left four sons, of whom only Amaury 4th had issue. The grandson of this Amaury, Simon 3d, surnamed the Bold, comte de Montfort and Evreux, married Amicie, daughter of Robert de Beaumont, earl of Leicester. His second son was the famous Simon 4th, comte de Montfort, and earl of Leicester, subsequently comte de Toulouse. This nobleman, so conspicuous in the terrible crusade against the Albigenses (q.v.), was born about the year 1150. In 1198 he went to Palestine at the head of a troop of French knights, but failed in doing anything against the Saracens, and was obliged to return. In 1202 he joined the 4th crusade, which, however, had no religious design
at all (see Crusades), in consequence of which Montfort abandoned it. In 1290 he took part in the war of extermination against the Albigensians. He signalised himself by his relentless ferocity, and his brilliant successes, but was killed by a stone at the siege of Toulouse, June 25, 1218.

MONTFORT, Simon de, Earl of Leicester, the fourth son of the preceding, was b. in France about 1206. The title of earl of Leicester came to him by his grandmother, Amicie de Beaumont, sister and heiress of Robert earl of Leicester, but he did not directly or immediately inherit it; for, during the reign of king John, it was borne by Ranulf, earl of Chester. Some time after the death of Ranulf, Montfort came to Eng-
land, and offered his services to Henry III. Already he enjoyed a great reputation as a warrior, and Henry was so highly pleased with the young French noble that he conferred on him the title of earl of Leicester. Little did Henry think that the stranger was to prove against himself a great founder and champion of English constitutional liberty. He married Elinor, sister to king Henry III., and the youthful widow of that earl of Pembroke to whom, more than to any other, the people of England owe magna charta.

After this marriage—which was viewed with disfavor by the king—De Montfort became a steadfast advocate of the English charter, and of the liberties of the people. After visiting the east, he was sent by the king to undertake the command of Gascony. In 1237 the king's debts were so great and the incapacity of his foreign relations so unbearable, that the people were in a state of insurrection. The barons assembled, and, under the direction of De Montfort, held the celebrated parliament at Oxford. They passed statutes providing for the suppression of the Albigenses, and for the imprisonment of the pope, but sent forthwith to the pope praying to be absolved from his oath. The bull of absolution arrived. Henry set his barons at defiance, shut himself up in the Tower, and appealed to Louis of France. England was now in arms. The whole middle class looked up to De Montfort as their champion and leader, and the war began with the battle of Northampton. The wars of the barons, under De Montfort, have been superficially viewed but as the strife of turbulent nobles, who, in the absence of foreign warfare, employed themselves in getting up a contest at home. Later researches, however, have shown that but for the struggles of De Montfort and the barons, the concessions at Runnymede would have been a mere worthless parchment. At Lewes the royal forces were signalily discomfited, and the king taken captive. A French chronicler, who praises De Montfort as "noble, chivalrous, and the ablest man of the age," expressly adds that he was "backed by the general favor of the people," who at this time were said "unspeakingly trampled on the foot by all their underlings of distinction from the king, that he should observe magna charta and the charter of the Forests; be moderate in his expenses and grants, until his old debts were paid off, and he was enabled to live on his own property, without oppression of merchants or the poor; and that Englishmen only should be chosen counselors. No new pretensions were introduced, even at this moment of triumph, and the constitutional maxim of respecting the person of the king was carefully upheld. The queen (Elinor of Provence), who was in France, now occupied herself in collecting a large army. To deliberate upon the measures to be adopted at this great crisis, writs were issued to the sheriffs, in 1265, by De Montfort, directing them to return two knights for each county, and two citizens or burgesses for every city and borough; and from this time may be clearly dated the recognition of the commons as an estate of the realm in parliament. Guardians had been appointed by the barons to watch over the execution of magna charta, but fifty years of eons had passed before the people convinced De Montfort that a stronger and more enduring security would be to commit the care of constitutional freedom to themselves, whose interests the barons thus identified with their own. Mr. Blaquy, who, in his Barons' War, presents De Montfort almost for the first time in his true character, adds that "it should be an honest pride to us in after-times that English liberty thus owes its birth to the noblest parentage, confidence in the people." A second war broke out, and this time the popular cause was weakened by defection and treachery. Prince Edward (afterwards Edward I.) encountered the barons at Evesham, with a greatly superior army. When defeat was inevitable, the great leader refused to flee. He "fought stoutly like a giant for the liberties of England," but fell, overwhelmed by numbers. The death of De Montfort filled the whole land with mourning. Like Cromwell, whose career in many respects resembles his own, he was denied a grave by the royalists, his head being sent to Wigmore castle, and his mutilated limbs to different towns; but the people bewailed their dead champion, and the clergy pointed to his glorified spirit in heaven. The influence of De Montfort was felt after his death, his barons were executed for bearing arms against his sovereign, and although the Oxford statutes were formally rescinded, their spirit remained. See Life, by M. Creighton (1876); and Simon de Montfort, by Pauli, translated by Una M. Goodwin (1876).

MONTGOLFIER, Jacques Etienne and Joseph Michael, two brothers, distinguished as the inventors of the first kind of balloons (q.v.). They were the sons of a celebrated paper-manufacturer at Annonay, in the department of Ardeche, and early engaged themselves in the same branch of industry. Etienne, after a few successive experiments with the balloon, repaired to Paris; but though his discovery created a great sensation, and was followed out in practice by many eminent men, he obtained little pecuniary aid in
Montfort.
Montgomery.

Carrying on his experiments, and at length retired to his native town, where he resumed the manufacture of paper and died at Services, in 1719.—His elder brother, Joseph, the sharer of his labors and his glory, was a man of much genius and little education; but the two brothers were fitted to supplement each other's deficiencies, and together they made many discoveries, and were both received as members of the French academy. Joseph invented the hydraulic screw, the calorimeter, etc., and in the latter part of his life, filled a post in the department of arts and manufactures. He died at Paris in 1810.

Montgomery, a co. in s.w. Alabama, intersected by the Tallapoosa river, bounded n.w. by the Coosa and Alabama, and drained by many creeks; three railroads pass through it: the Western, Mobile and Montgomery, and Montgomery and Enfamla; 900 sq. m.; pop. '80, 5,729—258 colored. The surface is rolling or even, and very fertile; Indian corn, cotton, and sweet potatoes are the staples; of cotton the annual product is over 25,000 bales, and it is the largest cotton producing county in the state. The co. seat, Montgomery, is also the capital of the state.

Montgomery, a co. in w. central Arkansas, drained by Ouachita river, Caddo creek, and their many branches; 1140 sq. m.; pop. '80, 5,729—258 colored. The surface is rugged and mountainous; the main ridge is called Crystal mountains, and there are found quantities of rock crystals. The soil is not very fertile; tobacco, wheat, Indian corn and cotton are the staples. The forests are very extensive; lead and limestone are found in considerable amounts. Co. seat, Montgomery.

Montgomery, a co. in s.e. central Georgia, intersected by the Oconee river, and bounded n.e., s., and s.w. by the Pendleton, Altamaha, and Ocmulgee rivers; 624 sq. m.; pop. '80, 5,381—1871 colored. The surface is level and mostly covered with forests; soil light and sandy; chief products; cotton, wool, sweet potatoes, oats, and Indian corn. Co. seat, Monticello. near Montgomery.

Montgomery, a co. in s.w. central Illinois, drained by Shad creek and its branches; intersected by the Decatur and St. Louis, and Indianapolis and St. Louis railroads; about 700 sq. m.; pop. '80, 28,086—25,438 of American birth. The surface is partly woodland abounding in oak, hickory, etc., and partly prairie; the soil is very fertile and all the cereals are raised in large quantities; bituminous coal is found. Co. seat, Hillsborough.

Montgomery, a co. in w. central Indiana; drained by Sugar creek, a branch of Wabash river, and two or three other creeks; intersected by several railroads having their terminals at Crawfordsville; among which are the Louisianna, New Albany and Chicago, and the Indiana, Bloomington and Western; about 500 sq. m.; pop. '80, 27,316—26,537 of American birth. The surface is level or moderately hilly, and is fairly fertile; the staples are wheat, oats, Indian corn, hay, and pork. There is much woodland, the sugar maple abounding. Co. seat, Crawfordsville.

Montgomery, a co. in s.w. Iowa, drained by the sources of the Nodaway and Nishnabatoma rivers; intersected by the Burlington and Missouri railroad, and by a branch of the St. Joseph and Council Bluffs; 432 sq. m.; pop. '80, 15,895—13,448 of American birth. Surface rolling and fertile; staples; wheat, Indian corn, hay, and pork. Co. seat, Red Oak.

Montgomery, a co. in s.e. Kansas, drained by the Elk, Fall, and Verdigris rivers; intersected by the Leavenworth, Lawrence and Galveston railroad; 576 sq. m.; pop. '80, 18,217—17,824 of American birth; the number having more than doubled since the census of '70. The surface is mostly prairie, but there is some woodland; wheat, oats, and hay are staples; cattle breeding is extensively carried on. Co. seat, Independence.

Montgomery, a co. in n.e. central Kentucky, drained by branches of Licking river, and intersected by the Lexington and Big Sandy railroad; 185 sq. m.; pop. '80, 10,567—3,526 colored. The surface is broken and hilly, and the soil fairly fertile; wheat, oats, potatoes, hay, butter, and pork are the chief products. Co. seat, Mount Sterling.

Montgomery, a co. in w. Maryland, having the state line of Virginia for its s.w. and s. boundary, the District of Columbia for its s., the Potomac river on the s. and w., and the Patuxent river on the n.e.; 500 sq. m.; pop. '80, 24,759—24,390 of American birth; 9,151 colored. It is intersected by the Southern and Rock creeks. It is intersected by the metropolitan branch of the Baltimore and Ohio railroad, and the Chesapeake and Ohio canal which is on the s.w. border, following the course of the Potomac. Its surface is hilly and is covered with various forests of pine and hardwood timber, and quarries of stone used for building purposes; other mineral products are gneiss and serpentine. Its soil is fertile along the river banks, producing wheat, rye, corn, oats, potatoes, and dairy products. Live stock is raised to some extent. Co. seat, Rockville.

Montgomery, a co. in n. central Mississippi, drained by the Big Black river, and intersected by the New Orleans, St. Louis and Chicago railroad; about 450 sq.m.; pop. '80, 13,348—6,677 colored. The county was set off from Choctaw and Carroll counties in 1872. The surface is level, and there are large forests, mostly of oak, cypress, and magnolia trees. Cotton is raised in large quantities. Co. seat, Winona.
MONTGOMERY, a co. in e. central Missourī, drained by the Cuivre and Lautre rivers, branches of the Missouri, which bounds it on the s.; intersected by the St. Louis, Kansas City and Northern railroad; about 500 sq.m.; pop. 80, 10,251—15,305 of American birth. The surface is very hilly and for the most part covered by extensive forests. Wheat, corn, oats, and tobacco are raised; limestone, iron, and bituminous coal are found. Co. seat, Danville.

MONTGOMERY, a co. in the eastern part of central New York, on the Erie canal and the New York Central railroad; about 356 sq.m.; pop. '70, 34,457. Most of its land is fertile, producing wheat, Indian corn, and oats. The chief industries are the manufacture of agricultural implements. Co. seat, Fonda.

MONTGOMERY, a co. in s. central North Carolina, drained by the branches of the Yadkin river, which forms its w. boundary, and intersected by the Ularce river and Simmon's Fork; 540 sq.m.; pop. '70, 7,487—7,489 of American birth. The surface is hilly, and mostly covered with pine forests. The bottom land about the creeks is fertile, and produces Indian corn, wheat, oats, and grass. Gold is found, but not in large quantities. Chief town, Troy.

MONTGOMERY, a co. in s.w. Ohio, drained by the Miami river, several of its branches, and Mad river; it is traversed by nine lines of railroad, terminating at Dayton, of which the most important are the Sandusky; Dayton, Hamilton, and Cincinnati; Dayton and Western; Atlantic and Great Western; and Dayton and Xenia; 450 sq.m.; pop. '80, 78,545—66,248 of American birth. The surface is mostly hilly but not rugged, and is covered in part by forests of hard wood; the soil is extremely fertile, producing wheat. Indian corn, oats, hay, and tobacco; of the last, the annual yield is from three and a half to four million pounds. Limestone of several kinds is found, and the Niagara, or bluish variety, is extensively used for buildings in Cincinnati and elsewhere. The Miami canal extends from Dayton to Cincinnati, and furnishes abundant water power. The principal manufacturing interests are at the county-seat, Dayton (q.v.).

MONTGOMERY, a co. in s.e. Penn., on the Philadelphia and Reading railroad, and the Schuykill river; 460 sq.m.; pop. '70, 81,612. Its principal products are wheat, rye, and Indian corn; its industries, the manufacture of agricultural implements, carriages, and woolen goods. Co. seat, Norristown.

MONTGOMERY, a co. in u. central Tennessee, adjoining Kentucky; drained by the Red river and the Cumberland, the latter a navigable stream; intersected by the Louis ville and Great Southern railroad; about 500 sq.m.; pop. '80, 28,461—13,620 colored. The surface is rolling and hilly, in great part covered by forests of oak, beech, gum, hickory, etc.; the soil is very good, producing in large quantities wheat, oats, corn, sweet potatoes, and tobacco; the annual yield of the latter is about 5,000,000 lbs., more than is raised in any other county of the state. Limestone and iron are mined. There are several towns, Clarksville being the county seat.

MONTGOMERY, a co. in s.e. Texas, drained by the San Jacinto river and several creeks, and intersected by the International and Great Northern railroad; 1,050 sq.m.; pop. '80, 10,154—5,229 colored. The surface is rolling and generally fertile, though there are some sand plain; corn, sweet potatoes, and cotton are the chief products. Cattle raising is carried on extensively. Co. seat, Montgomery.

MONTGOMERY, a co. in s.w. Virginia, drained by the Staunton and New or Kan awha rivers, the last being its w. boundary, and intersected by the Atlantic, Mississippi, and Ohio railroad; 460 sq.m.; pop. '80, 16,693—4,229 colored. The surface is mountainous, the co. being close to the Blue Ridge; there are extensive forests; and in the valleys, wheat, Indian corn, oats, and pork are the staples. Limestone is found. The climate is very healthful and invigorating. Co. seat, Christiansburg.

MONTGOMERY, a city and the capital of Alabama, is on the left bank of the Alabama river, 415 m. above Mobile, at the head of steamboat navigation. The city is very handsomely built, with elegant residences and gardens on a cluster of hills, on one of which is a handsome state house. It has a law-school, several academies, fourteen churches, five banks, four papers, marble-works, iron-foundries, and is one of the largest cotton-marts in the state. Montgomery is connected with four lines of railway. It became, in 1889, the capital of the confederate states, and continued to be the seat of government until, on the secession of Virginia, it was removed to Richmond. Pop. '70, 10,588.

MONTGOMERY (town), a city in Montgomery co., Ala., the capital of the state, and the co. seat, but inferior in size and population to Mobile; situated on a bluff on the left bank of the Alabama river and about 400 m. by river from Mobile; pop. '70, 10,588—5,183 colored. Montgomery is the terminus of the South and North Alabama railroad and of the Montgomery and Enfanta line, and is also on the Western Alabama railroad. The river is navigable and boats run to and from Mobile at all seasons. The city also does a large business with the surrounding country, which is almost wholly engaged in the raising of cotton, an enormous quantity being sent to Montgomery annually, and all supplies obtained thence. In 1861-62 the place was occupied as a capital by the confed erate government; evacuated in 1865 and a great amount of property destroyed, in part by the confederate and in part by the union forces. The city has 3 newspapers issu-
ing daily and weekly editions, 4 banks, and 14 churches; among the public buildings are the state capitol, the co. court-house, a city-hall, masonic temple, etc. Montgomery was founded in 1817, and in 1847 was made the capital in place of Tuscaloosa.

MONTGOMERY, Gabriel, Comte de, a French knight of Scottish extraction, and an officer in the Scottish life-guard of the king of France, was born about 1530. At a tournament given, June 29, 1559, by Henry II. in honor of his daughter's marriage with Philip of Spain, the king insisted upon young Montgomery entering the lists with him. Montgomery reluctantly complied, and the shaft of his broken lance entering the king's visor at the eye, Henry II. was borne insensible from the ground, and so continued for eleven days, when he died. Montgomery, although blameless, left France, and soon after embraced Protestantism in England. On the commencement of the religious wars in 1562, he returned to his native country to support the Protestant cause, and defended Rouen with great bravery. In the third religious war, he was one of the leaders of the Protestants, and gained many advantages over the royalists in Languedoc and Bearm. During the massacre of St. Bartholomew he happened to be at Paris, and owed his escape to the swiftness of his horse, and fled to England. In April, 1573, he appeared off Rochelle with a small fleet, but failed in accomplishing anything, and was obliged to retire. Next year, at the head of a band of Huguenots, he landed in Normandy, and commenced war there; but being compelled at last to surrender the castle of Donfromt, he was carried to Paris; and although the gen. to whom he surrendered had assured him of his life, he was beheaded, after long imprisonment, May 27, 1574. Brantome describes him as naturally the most nonchalant and pleasure-loving of men, but that the terrible service he had mounted his saddle, there was not a more daring or vigilant warrior in all Christendom.

MONTGOMERY, James, a minor British poet, the son of a Moravian preacher, was born at Irvine, Ayrshire, Nov. 4, 1771, and at the age of seven was sent to the Moravian settlement at Fulneck, near Leeds, in order to complete his education for the Moravian pastorate. At Fulneck the course of study seems to have been too severe in its character for the young poet; the imaginative side of his mind was allowed no recognition and it was only by stealth that he read Cowper's poems and Robinson Crusoe. Much of his leisure time at school was employed in the composition of verses and music, in which he took much delight. In 1789 he ran away, and after four years of various employment, became engaged as clerk to Mr. Gales, editor of The Sheffield Register, for which he soon began to write political articles. In 1794 he commenced a newspaper of his own, The Sheffield Iris, which he continued to edit till 1825, when he retired. During the period of his editorship Montgomery was twice subjected to fine and imprisonment by government. In 1796 he was fined £30, and sentenced to three months' imprisonment, for printing off some copies of a miserable ballad in which government suspected that sedition lurked, and in 1796 he was fined £30, and imprisoned for six months, for giving an account of a Sheffield riot. He received a government pension of £150 in 1835, and he died at his own house in Sheffield, April 30, 1854. His principal works are: The Wanderer of Switzerland (1806); The West Indies (1809); The World before the Flood (1812); and The Pelican Island, and other Poems (1827). A collected edition of his minor poems appeared in 1851; and in 1873 his Original Hymns for Public, Private, and Social Devotions closed the series of his publications.

His poems are melodious, full of picturesque description, and the gentlest human feeling. The personages introduced in his poems are, however, only shadows, or touched with the faintest color of character. But he claims a well-defined position among the favorite poets of his country by several of his hymns and minor poems, and by his exquisite verses on Home, which commences the third part of The West Indies.

MONTGOMERY, John B., 1796-1873, b. N. J.; entered the navy in 1812, and was a midshipman on the Niagara in the battle of lake Erie, Sept. 10, 1813. For his gallantry on this occasion congress gave him a sword and a vote of thanks. He was attached to the squadron commanded by Decatur in the war with Algiers, commanded the Portsmouth during the Mexican war, in which he seized lower California and blockaded Mazatlan, and was made a cap. in 1853. He commanded the Pacific squadron in 1860, was commodore in 1862, and rear-admiral in 1866. He was last stationed at Sackett's Harbor, N. Y. He was retired in 1869.

MONTGOMERY, Richard, 1736-75, b. in Ireland, son of Thomas Montgomery, member of parliament for Lifford: educated at Trinity college, Dublin. In 1754 he obtained a commission in the army, came to America with his regiment three years afterwards, and displayed personal courage and military sagacity at the siege of Louisburg and in other actions. In 1760 gen. Wolfe appointed him adjutant of his own regiment. He took part in the expedition against Havana and Martinique, and shortly after returned to England (1763); resided there for nine years, sold his commission, and again came to America. He settled and married in New York, was a delegate from his county, Dutchess, to the provincial convention of 1775, and soon afterward was commissioned by congress as one of the brig-gens, to command the colonial forces. An invasion of Canada was determined upon and in the same year (1775) Montgomery was made sea-officer in command of one of the two divisions sent out under Arnold and Schuyler. The latter was attacked by illness and obliged to return to Albany, leaving Montgomery at the
head of the division. He at once pressed forward and though embarrassed by lack of munitions and food, and by the disaffection of some of his command, had before the end of November captured successively Chambly, St. Johns, and Montreal; thus gaining the mastery over the greater part of the province. In the next month a junction was effected with Arnold before Quebec. The assault of the town was at once resolved upon and on Dec. 31, shortly after midnight, attempted, a snow-full aiding the concealment of the troops' movements. One division was to direct its attack against the fortifications at the lower end of the town, while the other under Montgomery's command was to scale the cape. Diamond bastion. The surprise was complete, the British artillerists retreating after one discharge. Unhappily Montgomery, who was pressing forward at the head of his troops, was instantly killed by this single fire, two of his aids falling with him. The undisciplined colonial troops were overwhelmed at the loss of their leader, and a precipitate retreat ensued. There is little doubt that Quebec would have fallen had it not been for the death of the gallant commander. His conduct and character were eulogized in parliament by Burke, Chatham, and even the bitter Tory lord North; congress recognized his services by resolutions of respect and veneration; and by its order a monument was erected in his honor in front of St. Paul's church, New York city, where in 1818 his remains were interred with impressive ceremonies. The "Death of Montgomery" is one of Trumbull's masterpieces.

MONTGOMERY, Robert, a preacher and verse-maker, who has gained notoriety, if not fame, was born at Bath in 1807. He graduated b.a. at Oxford in 1833, m.a. in 1838, and was ordained in 1835. In 1836 he became minister of Percy street Episcopal chapel, London; he afterward removed to Glasgow, where he preached for four years, but returned to London, and resumed office at Percy street chapel in 1843. He died Dec. 3, 1855. Montgomery's works comprise a large number of volumes in prose and verse, on themes more or less sacred. He is best known by his poems. The Omniprospere of the Deity (1828) has passed through 26 editions. But his celebrity may be said to have derived from his anthologies of his and others' works in libraries. The result has been brought about to some extent by the judgment which Macaulay passed upon The Omniprospere and other works by this author.

MONTGOMERY, Sir Robert, l.l.d., b. Ireland, 1809; educated at Foyle college, Londonderry, and in 1828 appointed to the service of the East India company. In 1833 he was appointed judicial commissioner, superintendent of prisons, and director-general of elections, in the India civil service. For his services in India, and in quelling the disturbances in the Oude, of which he had been made chief commissioner in 1858, he was thanked by parliament, and knighted. From 1859 to 1865 he was lieutenant-gov. of the Punjab. In 1868 he was made a member of the council for India.

MONTGOMERY, William Reading, 1801-71; b. N. J.; graduated at West Point in 1825, and was appointed to the infantry. He served on the western and Canadian border, and through the Florida and Mexican wars. He was brevetted maj. for gallantry at Palo Alto and Resaca de la Palma. At Molino del Rey he led his regiment after the death of its senior officers, and was dangerously wounded. After further service in Texas and the west he resigned from the army in 1855. On the outbreak of the rebellion he raised a regiment of volunteers from his native state. For his gallantry at Bull Run he was made a brig. gen. He was military governor at various times of Alexandria, Annapolis, and Philadelphia; but resigned his commission, from ill-health, in 1864.

MONTGOMERYSHIRE, an inland co. cf n. Wales, between Shropshire on the e., and the Welsh cos., Merioneth and Cardigan, on the west. Area, 488,323 statute acres, of which only about 80,000 are under tillage; pop. 71,673. The surface is almost wholly mountainous, a large portion consisting of bleak elevated moorlands; but toward the English border there are several warm, fertile, and well-watered valleys. The Severn, the Vyrnwy, and the Dovey are the principal rivers. The county belongs almost entirely to the basin of the Severn. The mineral wealth of Montgomeryshire is not great, but copper, lead, and zinc are procured, and millstones, slates, and limestone are quarried. On the uplands the soil is poor, and suited principally for mountain pasture; but in the valleys grain and flax are raised. Cattle and sheep, and some pure breed Welsh ponies called "merlins," are reared. The Welsh-flannel manufacture is extensively carried on in the county. The capital is Montgomery; pop. 71,129, from which the county received its name, and which was so called from Roger de Montgomery, earl of Arundel and Shrewsbury, who in 1093 recaptured the town and castle, which had been wrested during the previous year by the Welsh from the founder, Baldwin, liet. of the Marches to William the conqueror and William Rufus. The county sends one member to the house of commons. The county business is carried on at Welshpool and Newtown alternately. There is an excellent trade in cattle and horses. Offa's dyke traverses the s.e. corner.

MONTH, originally the period of the moon's revolution round the earth. If this is reckoned from the position of the moon among the stars to her return to the same position, the period is called a sidereal month, and consists of 27 days, 7 hours, 43 minutes, 11½ seconds; but if from new moon to new moon, it is longer, being 29 days, 12 hours, 44 minutes, 3 seconds; this is called a synodical month (see Moon). The latter period forms
one of the three natural measures of the lapse of time, and, notwithstanding that its efficiency depends on the state of the atmosphere, it ranks next to the day in importance. There are several other periods used by astronomers to which this name is applied, as the tropical or periodic month (27 days, 7 hours, 43 minutes, 4.7 seconds), reckoned from the moon's passing the equinox till her return to the same point; the nodal month (27 days, 5 hours, 5 minutes, 29 seconds), from ascending node to ascending node; the anomalistic month (27 days, 13 hours, 18 minutes, 37 seconds), from perigee to perigee; and the solar month, which is the twelfth part of a solar year, consisting of 30 days, 16 hours, 29 minutes, and 4 seconds. Distinct from all these is the civil or calendar month, fixed by law for ordinary purposes, and consisting of a fixed number of days—from 28 to 31—according to the particular month. The calendar months, with the number of days belonging to each, are as follows:

See also the separate months under their own heads. The names by which the months are designated throughout Christendom were given them by the Romans; and though Charlemagne in the 9th c., and the French directory in the end of last century, attempted to substitute descriptive epithe's, the old-established names continue to be preferred.

**MONTOLON, CHARLES TRISTAN DE, Comte, afterwards Marquis de,** descended from an ancient French family, was b. at Paris, 1782. At the age of ten he entered the navy, but exchanged it for the army in 1798. His rise was rapid. He displayed great zeal on behalf of the first consul in the revolution of 18th Brumaire, in the capacity of chef d'escadron. He served in a number of campaigns, and was severely wounded at Wagram. Napoleon made him his chamberlain in 1809. He was made a gen. of brigade in 1814, and appointed to the chief command in the department of Loire. On Napoleon's abdication, Montolon remained in France, but held aloof from the Bourbons. No sooner had the emperor escaped from Elba and landed at Frejus, than Montolon hastened to join him. He was present at Waterloo, and accompanied Napoleon to St. Helena, continuing his devoted attentions to him till he breathed his last, and being named in his will as one of his trustees, spared no exertion to carry its provisions into effect. Along with gen. Gourgrand he published Mémoires pour servir à L'Histoire de France sous Napoléon, écrits à Ste.-Hélène sous sa dictée (8 vols., Par. 1823). He afterwards published a work entitled Récits de la Captivité de Ste.-Hélène (Lond. 1847). In the proclamations which Louis Napoleon issued on his landing at Boulogne in 1840, Montolon was named chief of his staff, and on this account he was condemned by the chamber of peers to 20 years' imprisonment; but he was afterwards pardoned. He died Aug. 21, 1863.

**MONTIS MIND** is the name of a Roman Catholic office for the dead, continued through the period of a month, or repeated at the end of that period; the word mind being used in the sense of remembrance, which it has not infrequently in the common version of the Scriptures and other old English writings.

**MONTIYON.** See Montyon.

**MONTI, VINCENZO,** the great regenerator of modern Italian poetry, was b. Feb. 19, 1753, in the Roman province of Ferrara, and studied in the university of Ferrara. On the termination of his studies he repaired to Rome (1778), where the patronage of friends obtained for him the post of secretary to the pope's nephew. During his abode in Rome he became involved in a bitter squabble with Alferi, whose fame as a master-tragedian of Italy was then high in the ascendant—a fact which may have been unpalatable to Monti in consequence of the failure of his own dramatic attempts. The assassination of Basville, the republican envoy of France, afforded to Monti a subject for his poem, La Bussolana. His two succeeding poems, the Musigonia and the Fermonade, contained the bitterest invectives against France and Bonaparte; but on the appearance of a French army before Rome, Monti, with the inexorable inconsistency which characterized his political conduct throughout, hastened to espouse the cause of France, and to invoke the protection of Bonaparte. Monti was shortly after appointed secretary of the Cisalpine directory; and in 1799 repaired to France, where he undertook the translation of Voltaire's poetical works. On returning to Italy he was appointed professor in the university of Pavia; and in 1805, on Bonaparte being proclaimed king of Italy, Monti was appointed state historiographer. On the fall of the empire Monti became the eulogist of the Austrian possessors of his country. In the midst of all these political vicissitudes, he pursued with vigor his studies of the classics, and accomplished one of his greatest works, the translation of the *Iliad* into Italian verse. Monti died at Milan, Oct. 35, 1828, of an apoplectic stroke, and was sincerely lamented, notwithstanding the many opponents his hasty susceptibility had created in life. The best editions of his works are those of Milan (1825–27, 8 vols.); and his *Opere Inedite e Rare* (Milan, 1899–33, 5 vols.). Monti
had a warm admiration of Dante, and partook, in some degree, of the spirit of the great master. His chief works are distinguished by sustained grandeur of imagery and diction, by daring flights of imagination, and by the delicacy, elevation, and fire of the sentiments expressed. They are too numerous for separate notice, but the best of them rank among the noblest productions of Italian genius.

MONTICELLO, the residence and estate of Thomas Jefferson, in Albemarle co., Va., three miles west of Charlottesville. The mansion, now in a dilapidated condition, stands on the top of a high hill overlooking a large extent of the neighboring country; and, at the time of its completion, about 1774, was one of the finest and most picturesque residences in the south, surrounded by beautiful lawns, groves, and gardens. It was Jefferson's home during sixty years; but shortly after his death his heirs were obliged to part with it.

MONTILLA, a t. of Spain, in the modern province of Cordova, and 29 m. s.s.e. of the city of that name. It stands on a hill-side rising from the south bank of a tributary of the Xenil. Manufactures of coarse linen and earthenware are carried on, and oil-mills are in operation. A famous wine is grown in the vicinity. Montilla is the birthplace of Gonzalo de Cordova, the "great captain." Pop. 15,000.

MONTJOIE ST. DENIS, the war-cry of the old kings of France, said to be as ancient as the days of Clovis, and from which the king-of-arms, Montjoie, who had exclusive jurisdiction in France, derived his title.

MONTLUÇON, a t. of France, department of Allier, is picturesquely situated on a hill on the right bank of the Cher, 40 m. w.s.w. of Moulins. It has some coarse cloth manufactures, and trade in corn, wine, and fruits. It has also iron-works and plate-glass manufactories. Pop. 76,219,904. At a distance of 10 m. are the wells of Nériès-les-Bains, celebrated in the time of the Romans—of whom many traces are left—and still much frequented by invalids.

MONTMAGNY, a co. in e. Quebec, having for its n. and n.w. boundary the St. Lawrence river at its widest portion. Goose island lying directly n., and the Grand Trunk railroad traversing the n. section on the s. bank of the river; about 628 sq. m.; pop. 71,185,555. It is bounded on the s.e. by the state line of Maine, and drained by the n.w. branch of the St. John's river in the s. section, flowing s. along the s. base of a range of mountains, and is drained also by the Rivière du Sud in the north. Its surface is hilly, furnishing good pasturage, and its soil is fertile. Forests of hard wood supply building timber, and it has saw and grist mills. Co. seat, Montmagny or St. Thomas.

MONTMARTRE. See Paris.

MONTMÉDY, FORTRESS OF. The t. of Montmédy, in France, is picturesquely located on the river Chiers; pop. about 2,000. It has commerce in grain and wine, and there are manufactures of cheap leathers. It was in the line of the German invasion of France in 1870, and, being a fortified place, was defended with 8 rifled cannon and 65 pieces in battery, and contained a vast supply of munitions of war. It resisted the bombardment of the Germans in September, but succumbed to another attack Dec. 14.

MONTMORENCY, a co. in n.e. Michigan, drained by Black river and Thunder Bay river; 576 sq. m.; population not given in any census returns; unorganized in '80. Its surface consists of table-lands, with a sterile soil. It is extensively covered with forests, and contains beds of iron ore.

MONTMORENCY, a co. in the e. of the province of Quebec, Canada; n.w. of the St. Lawrence; intersected by the St. Anne and Montmorency railroads; 2,183 sq. m.; pop. '70,12,085—11,692 of French descent. Co. seat, Château Richer.

MONTMORENCY, ANNE, first Duc de, Marshal and Constable of France, b. Mar. 1493, belonged to one of the oldest and greatest of the noble families of France. He received, it is said, the name of Anne from his godmother, Anne of Brittany. He distinguished himself by his gallantry and military skill in the wars between Francis I. and the emperor Charles V., and was taken prisoner along with his sovereign in the battle of Pavia, which was fought against his advice. He afterwards became the leader of the French government, showing great ability in matters of finance and diplomacy, and was made constable in 1538; but his rough manners made him an object of dislike to many; and the suspicions of the king having been aroused against him, he was suddenly banished from court in 1541, and passed ten years on his estates, till the accession of Henry II., when he came again to the head of affairs. In 1557 he commanded the French army which suffered the terrible defeat of St. Quentin, in which he was taken prisoner. During the minority of Charles IX., Montmorency, with the duke of Guise and the marshal St. André, composed the famous triumvirate which resisted Catherine de' Medici. In 1562 and 1566 he commanded the royal army against the Huguenots, and in both wars gained victories over them, but received a fatal wound at St. Denis, and died at Paris on the following day, Nov. 12, 1567.

MONTMORENCY, HENRI, second Duc de, grandson of the famous constable de Montmorency, b. at Chantilly, April 30, 1555. His godfather was the great Henri Quatre, who always called him his "son." When he was 17 years of age Louis XIII. made him admiral, and he defeated the Huguenots in Langnedoc, and took the isle of Ré from those
of Rochelle. He afterwards gained other victories over them, and in 1630 received the chief command of the French troops in Piedmont, where he defeated the Spaniards, for which he received a marshal’s baton. Unhappily for himself he ventured to oppose Richelieu, who had always been his enemy, and espoused the cause of Gaston, duke of Orleans; for this he was declared guilty of high treason, and marshal Schomberg being sent against him, defeated him at Castelmadary, and took him prisoner. Montmorency, although almost mortally wounded, was carried to Toulouse, sentenced to death by the parliament, and notwithstanding his expressions of penitence, and the most powerful intercession made for him—for example, by king Charles I. of England, the pope, the Venetian republic, and the duke of Savoy—was beheaded, Oct. 30, 1632. Montmorency was distinguished for his amiability and the courtesy of his manners, as well as for his valor.

MONTMORENCY, or MONTMORENCI, Falls of, on the Montmorency river, near its mouth, about 8 m. from Quebec, Canada. They are 50 ft. wide and 250 ft. high. They are much visited by tourists. A village of the same name is situated near them.

MONT RO, a t. of s. Italy, in the province of Avellino, built partly on the slope and partly around the base of a hill, 12 m. n. of Salerno. Pop. 4,721. It forms the central point of several villages, and has large markets and some linen and cloth manufactures.

MONTORO, a pleasant t. of Spain, in the modern province of Cordova, built on a rocky ridge, around which winds the Guadalquivir, 26 m. c.n.e. of Cordova. It contains one of the best hospitals in Andalusia. Most any drinkable water can be obtained within the town. The heights in the vicinity are clothed with olive plantations, and oil is largely exported from this quarter. Woolens and earthenware are manufactured. Pop. 10,500.

MONTOUR, a co. in e. central Pennsylvania; 150 sq. m.; pop. 70, 15,341—12,824 of American birth. The surface is uneven, and crossed from e. to w. by hills and ridges of a considerable height; one of these, Montour ridge, contains limestones and iron ore, which are found also in other parts of the county; rolled and forged iron is largely exported. The n. branch of the Susquehanna flows through the s., and the rest of the county is watered by Big Roaring, Mahanouring and Chillisquaque creeks. The chief staples are oats, Indian corn, wheat, and potatoes. It is on the Lackawanna and Bloomsburg, and Danville, Hazleton, and Wilkesbarre railroads. Co. seat, Danville.

MONTPELIER, the capital of Vermont, is on the Winooski river, 215 m. n.n.w. of Boston. It is a picturesque village, with a handsome state-house, 7 churches, 2 banks, 4 newspapers, iron-foundry, flour-mills, and manufactures of carriages, hats, lumber, etc. Pop. 70, 3,023.

MONTPELLIER (ante), co. seat of Washington co., Vt.; on the Onion river, 40 m. e.e. of Burlington, and 150 m. n.n.w. of Boston; lat. 44° 17’ n., long. 72° 35’ w. It is on the Central Vermont, Montpellier and Wells river, and the Montpellier and White river railroads, and built on a plain surrounded by a hilly country. The state-house, erected in 1857, is of granite, and surrounded by a dome 124 ft. high. It also contains a court-house, 7 churches, banks, insurance companies, 4 weekly newspapers, the state library, and the Vermont Methodist seminary and college for women, besides a number of public and private schools. It is a center of trade for the country, and contains machine-shops, tanneries, foundries, and flour and saw mills. Hats and caps, furniture, and children's carriages are also manufactured. It was made the state capital in 1805.

MONTPELLIER (Lat. Monspessulanus or puellarum), a city of France, in the department of Hérault, in 43° 36' n. lat., and 3° 50' e. long. Pop. 70, of the town alone, 51,838. Seen from a distance, Montpellier has an imposing appearance, from the number of its towers, steeples, and cupolas; but although its suburbs are clean and well built, the interior of the old town disappoints expectation, being chiefly remarkable for its crooked, dark, narrow, and dirty streets. The public walks, known as those of the Peyru, and some of the other more elevated points, afford glorious views, embracing the Mediterranean, the Alps, the Cevennes, and the Pyrenees. The most noteworthy buildings are the cathedral, the theater, the exchange, the hall of justice, the prefecture, the observatory, and the university. The last, which was founded in 1196, is composed of three faculties—that of medicine, founded in the 12th c. by Arabian physicians, and still ranking among the best in Europe—that of the exact, and that of the physical sciences. Montpellier has a botanical garden, the oldest in Europe; a public library of 50,000 volumes, and a pharmaceutical school; admirable museums, natural history and fine art collections, etc. The industrial products of Montpellier are pigments and other chemical preparations, brandy, liquors, perfumes, soap, cork, sugar, cotton, woolen, and fine leather goods; and the trade, which is very important, includes, besides these articles, wine, seeds, olive-oil, and fruits. Railways to Marseilles, Cette, and other ports, besides various canals, facilitate commercial and social intercourse, and few cities of the empire hold out greater attractions in regard to intellectual culture than Montpellier. Its geographical position has led to its being selected as a place of residence for consumptive patients; but the extreme clearness and even sharpness of the air in the more elevated parts of the town, the occasional occurrence of the icy wind known as the

U. K. X.—22
mistral, and the sudden accession of overpowering heats, would seem very materially to counteract some of its long reputed advantages.

MONTPENSIER, ANNE MARIE LOUISE d'ORLEANS, Duchesse de, 1627-93; niece of Louis XIII. of France, known as grande mademoiselle; one of the richest princesses of her time, ambitious, and beautiful. Though 11 years older than the dauphin, afterward Louis XIV., she sought to marry him but failed. Charles II. of England when driven from his throne was a refused suitor for her in marriage. In 1649 she placed herself with Condé at the head of the rebellion of the Fronde, and meeting with some transient success endeavored to make it the basis of claims on the hand of Louis XIV. Condé found in her wealth and resolution his most powerful auxiliary. Jointly they were at one time in possession of Paris, installed in the Hotel de ville, while Louis XIV. was obliged to fight for possession of the capital. While the battle was going on, July 2, 1652, in the faubourg St. Antoine between the troops of Condé and those of the king, the former was saved from defeat by Mlle. Montpensier, who ordered the guns of the Bastille to be turned against the king's troops, and with her own hand fired the first gun. In the excusses against the royalists which followed Condé's success in Paris, Mademoiselle was conspicuous for her humane efforts to put a stop to cruelties. On the re-entry of Louis XIV. into Paris, she retired to her estates for five years and dictated Mémoires. In 1657 at the age of 30, she was permitted to return to court, where she soon became ridiculous by falling in love with a young cadet named Lauzun, who was put in the Bastille by Louis XIV. on account of his dangerous blandishments. At the age of 42 Mademoiselle offered her hand and heart to the same youth, the king consenting to the marriage; but the consent was withdrawn before the ceremony could take place; Lauzun was sent away and afterward placed in the Bastille for ten years. It is supposed, however, that they had been secretly married, and that this was the pretext on which the king exercised his authority for their separation. When Mademoiselle was 52 years old the marriage was consummated, but Lauzun was then become a miserable wreck of former beauty, and the match was altogether unhappy. It is said that Lauzun's release from prison was bought by Montpensier by the settling of large estates on bastard sons of Louis XIV. by Mme. de Montespans. The brutality of Lauzun soon necessitated a separation, and she subsequently devoted herself to religious exercises. The Mémoires were published in 1693, a posthumous work in 1786 in 8 volumes. A Paris edition of these and other works from her pen was published by Chéron in 1858.

MONTPENSIER, ANTOINE MARIE PHILIPPE LOUIS d'ORLEANS, Duc de, b. France 1824, fifth son of Louis Philippe. He was educated at the college of Henry IV., and went to Africa in 1844 as lieut. in the artillery, receiving a wound in the Ziban campaign. After a tour in the east he married, in 1849, the infanta Marie Louise de Bourbon, sister of queen Isabella II. The marriage created great excitement. Louis Philippe in 1851 formally cabled with an intention to send his son upon the throne of Spain. During the revolution of 1848, the duke resided in England, but soon returned to Spain, taking up his residence at Seville. In 1859, he was appointed capt. gen. of the Spanish army. During the political agitation, before the flight of Isabella, the duke quitted Spain at the request of the ministry, at the same time resigning his position in the army, and the title of infante. Returning to Spain, under the provisional government, he offered himself as a candidate for the throne, but destroyed his chances for election by a duel with his cousin, the infante don Enrique de Bourbon, whom he killed March 12, 1870. He was court-martialed and sentenced to one month's banishment from the capital. His eldest daughter, Marie, was married to the comte de Paris, in 1848; and his third daughter, Maria de las Mercedes, married her cousin, Alfonso XII., in 1878, and died June 26, of the same year.

MONTRAILLE, a co. in n.w. Dakota, n.e. of the Missouri river, next to British America. The Rivière des Laacs, and White Earth river flow through it. It has only lately been set off.

MONTREAL, the large and fertile island on which the city of the same name is built, is 80 m. long, 10 m. at its greatest breadth, and contains 197 sq. miles. Formed by the separation of the two channels by which the Ottawa issues into the St. Lawrence, its surface, except at Mount Royal, is only diversified by gentle undulations, which run from n.e. to s.w., and are named Cotéaux. The island forms a co., divided into two ridings, the east, or Hochelaga, and the west, or Jacques Cartier, each of which returns a member to the provincial parliament.

MONTREAL, the largest city of Lower Canada and of British America, lies in lat. 45° 31' n., long. 73° 35' w., on the left bank of the St. Lawrence, 180 m. above Quebec, and 28 m. below Lake Ontario, 40 m. by New York, and 2,750 from Liverpool. Its eastern boundary now forms an incorporated village, called Hochelaga, was originally the site of an Indian village of the same name, discovered in September, 1535, by Jacques Cartier; and it is from his admiring exclamation at the view obtained from the neighboring hill, that Montreal (corrupted from Mont Royal) derives its name. The western permanent settlement which the French obtained in Canada, it was, under them, merely an outpost of Quebec, and continued to be such, under British rule, till 1822, when it became a separate port. Since then, the rapidity of its progress has been
Montpensier.
Montreal.

astonishing. By the deepening of the shallower parts of the river above Quebec, Montreal is now accessible to vessels of over 3,000 tons burden, and drawing from 19 to 22 feet. Its harbor, lined with wharfs for a mile and a quarter, at which 125 ships could lie at one time, is, from its inland position (90 m. above the influence of the tides), perfectly safe. Situated at the head of the ocean-navigation of the St. Lawrence, Montreal has naturally become the depot for the exports and imports of all the Canadas. At the same time, the obstruction to vessels sailing further up the river, caused by the rapids, has been surmounted by means of the locks. The navigation of Montreal with Lake Ontario have locks of 200 ft. by 45, with 9 ft. of water on the sill; the locks of the Welland Canal are rather smaller. As Montreal lies also near the confluence of the Ottawa and St. Lawrence, it is in immediate connection with the vast lumber-country adjoining the former river and its tributaries; while a canal has been projected to connect the Ottawa, through lake Nipissing, with the Georgian bay in lake Huron, which, if carried out, will probably bring the produce of the north-western states, as well as of Western Canada, through Montreal, as it would give them an outlet to the ocean between 200 and 300 miles shorter than by the Erie canal. But even at present, while navigation is open, an extensive daily traffic is carried on by steamers and sailing-vessels of every description, with lake Ontario and the Ottawa district, as well as with the lower St. Lawrence, and the ships of the Montreal Ocean Steamship Company, by aid of a subsidy from the Canadian government, keep up a weekly communication with Liverpool, while at the same time the harbor is constantly crowded with vessels from other foreign ports. After the navigation of the St. Lawrence is closed, the ocean-stemmers find a harbor at Portland, Maine, which is connected with Montreal by a railway of 292 miles. This line belongs to the Grand Trunk Railway Company, and crosses the St. Lawrence at Montreal, by the celebrated tubular Victoria Bridge, the length of which, including its two abutments and 24 piers, is above a mile and three-quarters. By the lines of the same company, Montreal has railway communication with Upper Canada, the western states, and Lower Canada, while the Intercolonial Railway opens up communication with Halifax and St. John. Several other lines afford direct communication with all the important cities and towns in New York state, and the states of New England. The position, therefore, of Montreal as a center of commerce is perhaps unequaled, and its rapid advance in consequence has placed it, within the last few years, among the first commercial cities of the American continent—second, perhaps, only to New York. Its exports, imports, and duties, collected during the four years previous to 1862, were as follows: 1858—exports, £684,588; imports, £2,450,815; duty collected, £334,768. 1859—exports, £968,952; imports, £3,110,714; duty collected, £467,248. 1860—exports, £1,204,148; imports, £3,066,802; duty collected, £490,770. 1861—exports, £2,083,147; imports, £3,239,513; duty collected, £478,695. For the year ending June 30, 1860, these items had attained the following greatly increased proportions: Exports, £4,979,252; imports, £5,350,169; duty collected, £860,000. In 1873, the value of exports was £4,933,257; of imports, £11,064,129. The value of assessed property in 1873 was £12,712,290: in 1857 it was only £4,609,907. The population has risen in like manner. In 1840, it was about 27,297; in 1852, it was 57,716; in 1854, about 65,000; in 1861, 90,359; and, in 1871, 107,321. The number of sea-going vessels arriving in the port of Montreal in 1873 was 432; in 1863, the number of sea-going vessels was only 292. The harbor is open on an average about eight months, from the latter half of April to the beginning of December.

The most conspicuous building in Montreal, which is, perhaps, also the finest church on the continent of America, is the Roman Catholic cathedral. Built in the Gothic style of the 13th c., it comprises seven chapels and nine aisles, and can accommodate between 6,000 and 7,000 people. It has six towers, of which the three on the main front are 220 ft. in height; and its chief window is 64 ft. high, and 32 broad. There are several other Roman Catholic churches belonging to the order of St. Sulpice, to whose members chiefly Montreal owes its foundation, and who still hold the seigniory of the island on which the city is built. Adjoining the cathedral, is the seminary of St. Sulpice, to which a large addition has been built within the last few years at a cost of £8,000. The city contains also some of the oldest Roman Catholic colleges in the colony. The French church, indeed, of the Roman Catholic church in Montreal has grown enormous, in consequence of the increased value of the property given to it during the early settlements of the French. The church of England has recently erected, at an expense of above £20,000, a new cathedral, which is very chaste in style, though somewhat small for a metropol-itan see. St. Andrew's church, the most important belonging to the church of Scotland, is also a very chaste specimen of Gothic architecture, and cost about £10,000. At about the same cost, the Methodists have built a handsome church in the florid Gothic style. Besides the Roman Catholic college in College street, St. Mary's college of the Jesuits, and a Baptist college, Montreal possesses an important university under the name of McGill College. Founded by a bequest of the Hon. James McGill in 1811, erected into a university by royal charter in 1821, and reorganized by an amended charter in 1852, it has now, besides its newly established medical department, several hundred undergraduates and professors, and has an attendance of upward of 300 students. Montreal is supplied with water by magnificent works, which cost about £120,000. The water is brought from St. Lawrence, above the Lachine Rapids, by an aqueduct five m. long to a pond, from
which it is forced up by power derived from part of its surplus waters into reservoirs capable of containing 30 million gallons, and situated 200 ft. above the level of the river. Along the side of the "Mountain," there is a line of mansions, which command the view that astonished J. Carter, and which may compare with the suburban mansions of the wealthiest cities in Europe or America. Montreal returns three members to the provincial parliament.

MONTREUX, a commune in the canton of Vaud, Switzerland, on lake Geneva, s.e. of Lausanne; pop. 70, 4,731. It contains a number of villages, including Clarens, celebrated in connection with J. Rousseau, and Montreux a winter resort for invalids. This commune is said to be one of the most healthful places in the world.

MONTROSE, a royal and parliamentary burgh and seaport on the n.e. coast of Scotland, in the county of Forfar, and situated at the mouth of the river South Esk, about 30 m. n.e. of Edinburgh, and 40 m. s. of Aberdeen. It stands on a level peninsula between the basin of the Esk (an expanse 7 m. in circumference, and dry at low water) and the mouth of the river. A fine suspension-bridge, 432 ft. long and 26 ft. broad—erected in 1828-29 at a cost of nearly £29,000—connects the town with Rossie island, which is again connected with the mainland by a small draw-bridge. The Royal lunatic asylum, opened in 1863 at a cost of upwards of £30,000, accommodates about 400 patients. Between the town and the shore are the "links" or downs, among the finest in Scotland for golfing or cricketing. The harbor affords excellent accommodation to vessels of large tonnage, there being 18 ft. of water on the bar at low-water of spring-tides, and is one of the best on the e. coast. Two lighthouses stand in a line on the n. bank of the river, about 400 yards apart; while a magnificent tower, named the Secundraigh lighthouse, erected by the board of trade in 1870 at a cost of nearly £3,700—exhibiting a clear white light, visible at nearly 20 m. distance—stands at the mouth of the river. Plax- spinning is the chief manufacture in the town, there being 4 factories of about 300 horse-power in the aggregate, employing upwards of 2,000 hands, at a weekly cost of about £1,500. There is also a large saw-mill, giving employment to nearly 300 men and boys. Ship and boat building, formerly a staple trade of the town, has greatly fallen off. Education is well represented in the town—the chief institution being the academy. In 1875, 1,751 vessels, of 108,773 tons, entered and cleared the port. Imports—coal, lime, slate, iron, flux, and manures; exports—manufactured goods, salmon, herring, dressed wood, and agricultural produce. In 1875, the total value of trade was £404,453. Pop. 71, 15,729. Montrose unites with Arbroath, Brechin, Forfar, and Bervie to send a member to parliament.

MONTROSE, JAMES GRAHAM, first marquis of, belonged to a family that can be traced back to the year 1138. Its first notable member was Sir JOHN GRIGE or Dundaff, who fell at the battle of Falkirk, July 22, 1298. Early in the 15th c., Sir WILLIAM GRAHAM married for his second wife a daughter of Robert III. ROBERT, the eldest son of this marriage, was ancestor of the Graham of Claverhouse. The third lord Graham, created earl of Montrose by James IV., fell at Flodden; his eldest son at Pinkie. The next in succession became viscount of Scotland after James VI. had ascended the throne of England on the continent, and James, who succeeded to the earldom in 1615, married lady Margaret Ruthven, eldest daughter of William, first earl of Gowrie, and sister of the unfortunate nobleman who gives name to the Gourie Conspiracy. The issue of this union was five daughters and one son, James, the "great marquis," who was born in 1612, according to tradition, in the town of Montrose. His mother died in 1618, his father in 1626. In the following year, the boy was sent to the university of St. Andrews by his guardian and brother-in-law, Archibald, lord Napier, son of the famous inventor of logarithms. He was an apt, if not an ardent student, and during the two or three sessions of his attendance at college, acquired a very respectable amount of classical knowledge, besides exhibiting a genuine predilection for literature, which the stormy character of his after-life never quite destroyed. In his 17th year, he married Margaret Carnegie, daughter of lord Carnegie of Kinnaird, on which occasion he had his portrait painted by Jameson, the pupil of Van Dyck. For the next three years he lived quietly at Kinnaird castle, pursuing his studies. On attaining his manhood, he traveled on the continent, visited the academies of France and Italy, and perfected himself in all the accomplishments becoming a gentleman and a soldier. On his return, he was introduced to king Charles I., but owing, it is said, to the machinations of the marquis of Hamilton, was coldly received by that monarch, and had no sooner reached Scotland, than he joined the ranks of the king's opponents, which at this period comprehended the majority of Scotchmen. Montrose came back in the very year (1637) when the tumults broke out in Edinburgh on the attempt to introduce the prayer-book. Whether his conduct at this moment was the result of chagrin, or whether he was carried away by the prevailing enthusiasm, or by the persuasions of crouther persons than himself, is difficult to say. Baillie speaks of his having been "brought in" by "the earliness of Reuther," a phrase which appears to Mr. Mark Napier to indicate that he was trepanned with difficulty into joining the league. As any member of the noble house of Montrose hoped to become one of the four noblemen selected to compose the "table" of the nobility, which, along with the other tables of the gentry, of the burghs, and of the ministers, drew up the
famous national covenant (see Covenants), sworn to by all ranks at Edinburgh in the spring of 1638. Montrose was appointed in the following summer to agitate for subscriptions in Aberdeenshire, where the influence of the marquis of Huntly was exercised on the side of the king. He did not, however, meet with great success. In 1639, he made three military expeditions to Aberdeenshire to overawe the royalists. The latter were in considerable force under the marquis of Huntly, but owing to the timid, if not treacherous orders of the marquis of Hamilton, then governor of Scotland, they were always forced to disband. Montrose twice took the city of Aberdeen. On the first occasion (March 28), he compelled the inhabitants to tear up the covenant, but did no injury to the city. His "too great" humanity is even lamented by Baillie. On the second (May 25), he imposed on the city a fine of 10,000 merks; but though his soldiers pillaged the place, he honorably resisted the importunities of the zealots among the Presbyterian clergy, who wished to expose it to the horrors of confiscation. Baillie again complains of his "too great lenity in sparing the enemy's houses." The arrival at Aberdeen by sea of the earl of Abony—Charles's lieutenant of the north—with some re-enforcements, induced Montrose to retreat, who was followed by the earl and the Gordon Highlanders. At Meagra Hill, near Stonehaven, a battle was fought (June 15) between the two armies, in which Montrose obtained a complete victory; four days later, he was again master of Aberdeen, after a fierce struggle at the passage of the Dee. The citizens were stricken with alarm, expecting some bloody punishment for their well-known Episcopal leanings, but Montrose agreeably disappointed their fears. At a reconciliation meeting, he was under the impression that the committee of estates for not having furnished the town on this occasion. News of the pacification of Berwick now arrived in Aberdeen, and terminated the struggle in the north. Charles invited several of the covenanting nobles to meet him at Berwick, where he was then holding his court, and to consult with him about Scottish affairs. Among those who went was Montrose, and the Presbyterians dated what they regarded as his apostasy from that interview. Be that as it may, his political position was certainly different after his return. In the general assembly which met, Aug. 13, 1639, under the presidency of the earl of Traquair, as royal commissioner, he showed symptoms of disaffection towards the covenant, and was the object of much popular obloquy. One night he is said to have found allixed upon his chamber-door a paper bearing these words, Insecit armis, verbis vinctor. The dissolution of the parliament, in June 1640, led to an open rupture between the king and the covenanters, and both parties prepared to decide their quarrel by force of arms. The former assembled at York an army of 21,000 horse and foot; the latter another of 26,000, which, under the command of Leslie, crossed the Tweed, Aug. 21, 1640. Montrose was the first man that forded the stream. The successes of the Scots, as is well known, soon forced Charles to summon a new parliament for the settlement of the national grievances. Meanwhile Montrose, along with several other influential nobles, had entered into a secret engagement at Cumbernauld, for the purpose of frustrating what they regarded as the factious designs of the extreme covenanting leaders. His conduct in England, too, had been suspicious. It was accidentally discovered that he had been secretly communicating with the king; and when the parliament assembled (Nov., 1640), he was cited to appear before a committee. The affair of the Cumbernauld bond, discovered by the ingenuity of Argyle, was brought up; but Montrose defended his conduct and that of his colleagues; and nothing came of it. To some of the clergy, says Guthrie, "pressed that their lives might go for it." In the following June, Montrose and some others were accused of plotting against Argyle, and were confined in Edinburgh Castle, where they remained till the beginning of 1642, when they were set at liberty in return for the concessions which Charles had made his Scottish subjects. Although they had been frequently examined, nothing definite had been proved against them. The accusation that Montrose had offered the king to assassinate Argyle, is not historically substantiated, and is intrinsically improbable. During the next two or three years, he kept aloof, outwardly, from public affairs, but he had finally broken with the covenanters, and had privately ranged himself on the side of the king. The civil war in England had now broken out, and was being carried on with dubious success. Charles and his advisers resolved to crush the Presbyterian leaders in Scotland, who were abetting the efforts of the English parliamentarians. In the spring of 1644 Montrose now raised to the rank of marquis, left Oxford, where he had been residing with his sovereign, and proceeded to Scotland to raise the royalists in the north. The battle of Marston Moor for a moment paralyzed him, but his resolution speedily returned. He threw himself into the highlands, and after skulking about the hills for some time in disguise, met at Blair-Athol some Irish auxiliaries and a body of Highlanders under Allaster Maccoll Keinach Macdonald, better known as Colkito, who had forced their way thither from the Western Isles in hopes of joining him. Montrose instantly placed himself at their head, and the clans quickly rallied round his standard. Marching south, he fell suddenly (Sept. 1) on the covenanting army commanded by lord Elcho, at Tippermuir, near Perth, and gained a complete victory. Not a single royalist was slain. The same night, Montrose entered Perth, where he remained for three days, levying a fine of 9,000 merks on the population. He then set out for the north, defeated a body of covenanters under lord Burleigh at Aberdeen (Sept. 13), and took possession of the city, which was abandoned for four days to all the horrors of war. The approach of Argyle,
at the head of 4,000 men, compelled Montrose, whose forces were far inferior in numbers and discipline, to retreat. He now plunged into the wilds of Badenoch, recrossed the Grampians, and suddenly appeared in Angus, where he wasted the estates of more than one covenanting nobleman. Having obtained fresh supplies, he once more returned to Aberdeen, with the view of raising the Gordons, narrowly escaped defeat at Pyvie in the end of Oct., and again withdrew into the fastnesses of the mountains. Argyll, baffled in all his attempts to capture or crush Montrose, returned to Edinburgh, and threw up his commission.

His opponent, receiving large accessions from the Highland clans, planned a winter campaign, marched south-westward into the country of the Campbells, devastated it frightfully, drove Argyll himself from his castle at Inverary, and then wheeled n., intending to attack Inverness, where the covenanters were posted in strong force under the earl of Seaforth. The "estates" at Edinburgh were greatly alarmed, and raising a fresh army, placed it under the command of gen. Baillie, a natural son of sir William Baillie of Lamington. After consulting with Argyll, it was arranged that he should proceed by way of Perth, and take Montrose in front, while Argyll should rally his vast array of vassals, and attack him in the rear. The royalist leader was in the great glen of Albu—"the basin of the Caledonian canal"—on his way to Inverness, when he heard that Argyll was following him. He instantly turned on his pursuer, fell upon him unexpectedly at Inverlochy, Feb. 2, 1645, and utterly routed his forces. Fifteen hundred of the Campbells were slain, and only four of Montrose's men. He then resumed his march northwards, but did not venture to assault Inverness—his wild mountaineers being admirably fitted for rapid irregular warfare, but not for the slow work of beagagement. Directing his course to the e., he passed—with fire and sword—through Elgin and Banockburn, and was afterwards pillaged and burnt. Baillie and his forces, Hurry, were at Brechin, but Montrose, by a dexterous movement, eluded them, captured and pillaged the city of Dundee (April 3), and escaped safely into the Grampians. On the 4th of May, he attacked and routed Hurry at Auldearn, near Nairn, and after enjoying a short respite with his fierce veterans in Badenoch, again issued from his wilds, and inflicted a still more disastrous defeat on Baillie himself at Alford, in Aberdeenshire (July 2). There was now nothing to prevent his march s., and about the end of the month, he set out with a force of from 5,000 to 6,000 men. He was followed by Baillie, who picked up re-enforcements on his way, and on the 15th of August again risked a battle at Kilsyth, but was defeated with frightful loss—6,000 of the covenanters being slain. The cause of Charles was for the moment triumphant; Montrose was virtually master of the country. The king formally appointed him lieut. gov. of Scotland, and the commander-in-chief of the royal forces. All the principal cities in the w. hastened to proclaim their fidelity, and laid the blame of the recent troubles on the unfortunate Presbyterian clergy. But affairs soon took a very different turn. Great numbers of the Highlanders returned home—we might even say, deserted—burdened with multifarious plunder; and the earl of Aboyne withdrew with all his cavalry. Montrose's position in a district teeming with enemies, was growing critical, and on the 4th of September he broke up his camp at Bothwell, and marched for the eastern counties, where Charles had informed him that the earls of Traquair, Home, and Roxburgh were ready to join him. In this he was disappointed, and on the 13th of the same month he was surprised at Philiphauge, near Selkirk, by David Leslie, who fell upon the relics of Montrose's army and his raw levies with 6,000 cavalry—the flower of the Scottish forces then serving in England—who had been hurriedly dispatched home on the news of Montrose's startling successes. Leslie completely annihilated his opponent. "On Philipauge," says sir W. Scott, "Montrose lost the fruit of six splendid victories." Escaping from the field of battle, he made his way to Athol, and again endeavored, but in vain, to rouse the Highlands; and at last Charles, now beginning to get the worst of it in the civil war, was induced to order him to withdraw from the kingdom. On the 3d of September, 1646, he sailed for Norway, whence he proceeded to Paris. Here he endeavored, but in vain, to induce Henrietta Maria to bestir herself on behalf of her husband. The queen coldly received all his suggestions, and at last Montrose, in despair, betook himself to Germany, in hope of service under the emperor, but soon after returned to Holland, and entered into communication with the prince of Wales, afterwards Charles II. It was here that news of Charles L's execution reached him. Montrose fainted on receipt of the dreadful intelligence, and gave way to the most passionate regrets. Charles II. now re-invested him with the dignity of lieut. gov. of Scotland, and Montrose undertook a fresh invasion, on behalf of the exiled monarch. In March, 1650, he arrived at the Orkneys with a small force, and after the lapse of three months procured leave to Cross; but no help could rise at his call. He forced his way as far s., as the borders of Ross-shire, where his dispirited troops were attacked and cut to pieces at a place called Corbiesdale, near the pass of Invencarron, by a powerful body of cavalry under col. Strachan. Montrose fled to the wilds of Assynt, where he was nearly starved to death, when he fell into the hands of M'Leod of Assynt, who delivered him up to gen. Leslie, by whom he was brought to Edinburgh. Condemned to death as a traitor to the covenant, he was executed, May 21, 1650. His demeanor in his last moments was very noble and dignified.
MONTS, Pierre de Gaoust, Sieur de, 1560–1612; b. in France of an Italian family, became a Protestant, and a favorite of Henry IV., a protégé in the royal household and governor of French provinces. In 1602 the king made him governor of the French company of Canada, which was given exclusive right to trade in furs between 30° and 50° N., lat., the right to make land grants and govern the country, under the name of Acadia, with the title for himself of vice-admiral and bentegen. Taking with him Samuel Champlain, Poiriercourt, Bievreand, and Pontgravé as chief officers, he sailed from Havre, March 7, 1604. He made Poiriercourt governor of Port Royal, explored the bay of Fundy, and hothed the plantation of Lawrence Crown, and returned to France. There he found his monopoly had excited such lively opposition that his privileges had been withdrawn. But he succeeded in recovering a part on more specific conditions and returned to Canada, where Champlain, one of his officers, founded the city of Quebec in 1608, and his fur trade became profitable. After Henry IV., was assassinated Monts's privileges were taken away, to his financial ruin. Charlevoix mentions Monts as a thoroughly honest man, of capacity and straightforwardness, fitted to succeed in any enterprise of a commercial character. He died in Paris.

MONTERRAT, one of the lesser Antilles, belonging to Britain, lies 43 m. n.w. of Guadeloupe, and at a similar distance from Antigua and St. Kitts. It is about 11 m. in length, 7 in breadth, and contains an area of 47 Eng. sq. miles. The population in 1871 was 8,693, the females exceeding the males by 737. About two-thirds of the surface is mountainous and barren, the rest is well cultivated. The chief products are sugar, limes, rum, and molasses; but cotton, arrow-root, and tamarinds are also exported. The island forms a mole of the government of the Leeward isles, and is directly ruled by a presidcnt, aided by a council and house of assembly. The Leewind Islands and Montserrat form the s. coast. The revenue of Montserrat in 1874 amounted to £4,648, and the expenditure to £3,085. In 1873 the tonnage of vessels which entered and cleared its port was 13,213; and the total values of imports and exports in 1874 were respectively £33,958 and £43,079.

MONTERRAT (Lat. Mons Serratus, so named from having jagged ridges like the teeth of a saw), a mountain of Catalonia, in the n.e. of Spain, about 30 m. from Barcelona. Its height is 3,919 feet. "Its outline," says Ford (Handbook for Spain, vol. i. p. 419), "is most fantastic, consisting of cones, pyramids, buttresses, nine-pins, sugar-loaves, which are here jumbled by nature in a sportive mood." The pious Catalans aver that it was thus riven and shattered at the crucifixion. Every rift and gorge is filled with box-trees, ivy, and other evergreens. From the topmost height the eye wanders over all Catalonia, and from the sea the ridge looks like an immense wall with seven pyramidal peaks.

The mountain, however, owes its celebrity not to its extraordinary appearance, but to the Benedictine abbey built upon it, at an elevation of 1200 feet, and to the 13 hermitages formerly peopled like eagles' nests on almost inaccessible pinnacles. In 1811 the French, under Suchet, plundered the abbey, burned the library, shot the hermits, and hung the monks (who had given shelter to their emigrant brethren at the revolution). The place suffered still more in 1827, when it became the stronghold of the Carlist insurrection.

MONTYON, or MONTTHON, Antoine Jean Baptiste Robert Angel, Baron de, (sometimes erroneously named MONTTHON), 1733–1829; b. in Paris. Left in the possession of considerable wealth while young, he soon became disillusioned by his noble acquaintances. An advocate at 23, member of the council of state at 27, at the head of the government of Auvergne at 33, Montyon in every place exhibited benevolence and philanthropy in connection with administrative ability. He dedicated 20,000 livres annually to the help of poor workmen. After serving successively as intendant of Provence and La Rochelle he was called to Paris to be made councilor of state in 1775. Author as well as statesman and philanthropist, he sent to the académie Française in 1777 an Éloge de Michel de l'hopital; in 1778 published Recherches et Considerations sur la Population de la France. Often he relieved the wants of writers in distress, who rarely knew the source of their benefactions. In 1789 he founded a large number of prizes in the various societies of France, to be awarded through their officers to meritorious improvements or work in the arts, for the most useful literary works, for the best means of avoiding the unhealthy effects of certain medicines, and for the best works, the foreigner is favorably on the processes, for the noblest acts performed by the poor, and for the most useful medicine. For each of these prizes or sets of prizes he set apart 12,000 livres of which the income should form the annual awards. At the beginning of the revolution, fearing the storm that menaced the rich and noble, he emigrated to Geneva, whence he sent an essay to the French academy, entitled, Consequences qui ont Résulté pour l'Europe de la Découverte de l'Amerique, for which he received the prize of 3,000 francs, and presented it to the academy to be used for another prize. He took no part while in Geneva, or afterwards while residing in England, with the intrigues of the royalists. In 1798 he published in London a valuable work entitled Rapport sur les Principes de la Monarchie Française, intended as a refutation of a work by Calonne in which that minister asserted that France never had had a legal constitution. Montyon made a masterly showing that while France had not been a legal or legal constitution, Mons her kings had always power and will to violate them at pleasure. He remained an exile from his country throughout the directory and the empire of Napoleon I., not so much by his attachment to the old monarchy.
as his repugnance to the military horrors of imperialism. He returned to Paris in 1814, and after 1815 re-established such of his prizes and beneficences as had been stopped by the revolution and the empire, and not only put them on a new footing but richly endowed new charitable institutions in Paris; and on his death in Paris distributed permanent bequests to a large number of the most beneficent institutions of France. Among his published works, the permanent value are: _Quelle Influence ont les diverses Impôts sur la Moralté, l’Activité, et l’Industrie des Peuples_; and, _Particulier et Observations sur les Ministres de Finances les plus célèbres depuis 1660 jusqu’en 1791_, a remarkably interesting compendium of facts, philosophy, and anecdotes.

**MONUMENT** (Lat. _monumentum_, from _monere_, to remind), anything durable made or erected to perpetuate the memory of persons or events. The chief kinds of monuments are described under their special names. See CAHIN; CROMLICH; SEPULCHRAL MONUMENTS; PILLAR; OBELISK; PYRAMID; ARCH, TRIUMPHAL; BRASSES; TOMB; STUPA; MAUSOLEUM, etc.

**MONUMENTAL THEOLOGY** designs the scientific study of theological opinion and feeling as unconsciously expressed in works of art. While, in written language, thought is presented by the discursive faculty in elements which are gradually apprehended, a work of art, as a completed object existing in space, may produce at once its grand impression on the mind. But as the Christian church took its rise in the midst of Judaism and of heathen worship, and as its first members had been trained under the influence of one or both of these conflicting systems, Christian monuments as well as early church doctrine and practice often present a mixed character. In the progress of the church it was also frequently attacked by errors within and hostile influences without, the effect of which would be exhibited in its works of art. A complete consideration of monumental theology, would, therefore, require careful attention to these modifying agencies. In the fertile district which yields art, the principles of Christianity, from its origin to the present day, have influenced human art as well as thought and life. While this influence has sometimes been disastrously exerted, it has generally been in some degree beneficial. After the revival of classical learning and the infusion of new elements into modern life, art was indeed partly liberated from that subject to the church which in the middle ages had been complete. Yet it must always find its noblest inspiration in Christian themes. Consequently its monuments may be expected to exhibit much of the Christian thought and feeling of each successive age. Hence recent writers on theological encyclopaedia continue the study of Christian monuments to the present time. Piper, the chief advocate of this method of collateral theological study, presents the following classification of its themes: 1. Of the essential nature of Christian art—1. Of the art faculty. 2. The artist. 3. Works of art. II. History of Christian art and art-works—1. Chronology and geography of art. 2. The various species of art. 3. Art monuments. III. Christian art ideas—1. In architecture. 2. In the graphic arts. For theological purposes this last is the principal division, and to illustrate it the others are chiefly preliminary. Architecture furnishes to this department much less than painting and sculpture. Biblical subjects are found represented in works of art through all periods of church history. The _Biblia Pauperum_, Bible of the poor, for example, consisted of 40 or 50 pictures giving the events of the life of Christ and some of the Old Testament times; each picture had a Latin text or sentence. A larger work with the text in rhyme was called the _Mirror of Salvation_. Before the reformation these were the chief text-books in use, especially by the monks in their preaching, and were practically all the Bible which the laity and even many of the clergy knew. The pictures were copied in sculptures, in paintings on walls and on glass, and in altar-pieces. And after the invention of printing the _Biblia Pauperum_ was perhaps the first book printed in Germany and Holland, first with wooden blocks and then with types. While monumental theology is an interesting and to some extent useful collateral study, its claim to an independent scientific treatment is denied by many eminent authors, and must be regarded, at best, undecided.

**MONZA** (anc. _Modatia_); chief t. of a district in the province of Milan, stands on the river Lambro, 10 m. n.e. of Milan, with which it is connected by railway. Pop. 72, 16,000. It is essentially a town of Lombard growth, and under the Lombard sovereigns was capital of their kingdom. It owes much of its early importance, and its chief public edifices, to Theodolinda, the great queen of the Lombard dynasty. In the middle ages, Monza was conspicuous for the wealth of its numerous citizens and nobles, and the extent of its cloth-trade. It has undergone 32 sieges. The cathedral, founded in the 6th c. by Theodolinda, contains many interesting monuments of this great queen, the famous iron crown (q.v.) and regalia of Lombardy, employed at the coronation of the German emperors as kings of Italy, were removed from Lombardy by the Austrians in 1859, on the cession of that province to France. The town has a good gymnasium, a theater, two hospitals, and a philharmonic institution. It presents manufactures of cotton, hats, and preserved meats are daily increasing. Monza is surrounded by an exuberantly fertile district, which yields abundance of grain, fruits, wine, and silk, and possesses great beauty of scenery and climate.

**MOODY**, a co. in s.e. Dakota, bounded by Missouri, drained by the Big Sioux river and its branches; about 500 sq.m.; pop. 980, 9,915—935 foreign, a very large increase.
within the last few years. The surface is a rolling prairie and quite fertile, wheat being the chief product. 'Co. seat, Flandreau.

MOODY, DWIGHT LYMAN, b. Mass., 1837. He worked on a farm until the age of 17, and then became a clerk in a boot and shoe store in Boston. He joined a Congregational church, and in 1856 he went to Chicago, where he engaged in mission work among the poor. He established a Sunday school, which in a year numbered 1600 scholars. During the war of the rebellion he was in the service of the Christian commission, and subsequently a city missionary employed by the Young Men's Christian association of Chicago. A church was built for him, and though unordained, he was chosen its pastor. In the Chicago fire of 1871, the church, mission house, and furniture were destroyed. A new church was erected large enough to accommodate 2,500 persons. In 1873 he visited Europe with Ira D. Sankey, the singer, holding large and successful meetings in Edinburgh, Glasgow, Dublin, London, and other important places. Returning home in 1875, he has held large and interesting meetings in New York and many other large cities. He makes no claim to scholarship or rhetorical graces; but is a close student of the Bible, a most earnest, faithful, and simple preacher, and is recognized as charitable and judicious. Vast crowds have attended his services in England and this country, and many converts have been gathered.

MOODY, JAMES, 1746-1809; b. N. J.; a farmer who commanded a force of Tories during the revolutionary war. He was taken prisoner, but escaped from West Point, where he was confined, and went to England. There, in 1783, he published an account of his loyalist campaigns, under the title of James Moody's Narrative of his Exile and Sufferings in the Cause of Government since 1776. After the war he removed to Nova Scotia. His Narrative was reprinted at New York in 1835.

MOODY, JOSHUA, 1633-97; b. England; in childhood came to Newbury, Mass.; graduated at Harvard college in 1653; began to preach in 1658; became pastor of the church in Portsmouth, N. H., in 1671. He became involved in quarrels with the government of the colony, and was imprisoned, but released on condition of his leaving the colony. In 1681 he was settled in Boston as the assistant minister of the First church; was appointed president of Harvard college, but declined the appointment. During the witchcraft trials in 1692 he opposed the unjust and violent measures against the accused, and aided some to escape from prison. His zeal occasioned his dismissal from the church, and he left the ministry. He published A Practical Discourse Concerning the Choice Benefit of Communion with God in His House, witnessed unto by the Experience of Saints as the best Improvement of Time, being the sum of Several Sermons on Psalm xcvii, 9, preached at Boston on Lecture Days; A Sermon on the Sin of Formality in God's Worship, preached on the Weekly Lecture in Boston.

MOODY, SAMUEL, 1676-1747; b. Mass.; graduated at Harvard college in 1697, was minister at York, Me.; was chaplain to sir William Pepperell's expedition against cape Breton. He was an eccentric but very useful man; some of his odd expressions are still in circulation, showing much shrewdness and a quick wit. He refused a regular salary, depending on the voluntary contributions of the people. He published The Delightful State of the Damned; Judas hung up in Chakra; Election Sermon; Life and Death of Joseph Quarso, an Indian.

MOOERS, BENJAMIN, 1758-1888; b. Mass.; was an ensign in the revolutionary army, and afterward lieut., and adj. He served through the war, at the close of which he settled in Plattsburg, N. Y. He was for a number of years a member of the legislature of that state, besides holding various local offices, and he was a maj. gen. of militia, and commanded at the battle of Plattsburg, Sept. 11, 1814. The Order Book, kept by him when adj., was published in 1876.

MOULTAN. See MULTÁN, ante.

MOON. The, the satellite of the earth, revolving round the earth from w. to e. in a period of one month (q. v.), and in consequence accompanying the earth in its motion round the sun. As the moon, to an observer on the earth, advances more than 13° to the e. daily, whilst the corresponding advance of the sun is barely 1°, her progress among the stars is much more notable than that of the latter. This rapid angular motion, the continual and regular variation of her illuminated surface, and her large apparent size (being nearly equal to that of the sun), have rendered the moon an object of general interest; while her importance as the principal nocturnal substitute for the sun, and her special value to navigators and geographers, in the determination of longitudes (see Latitude and Longitude), have rendered the lunar theory the object of the most thorough and careful investigation.

Place of the Moon. — The first peculiarity about the moon that strikes a casual observer is the constant and regular change of her illuminated surface from a thin crescent to a circle, and vice versa, and a corresponding change in the time of her appearance above the horizon. These changes depend upon the position of the moon relative to the earth and the sun, for it is only the half of the moon facing the sun that is illuminated by his rays, and the whole of this illuminated portion can only be seen from the earth when the sun, earth, and moon are in a straight line (the line of syzygies), and the earth is between the sun and moon. When the moon is in the line of syzygies, but
between the earth and the sun, no part of her illuminated disk can be seen from the earth. In the former case, the moon is said to be **full**, and in the latter, **new**. A few hours after "new moon," the moon appears a little to the east of the sun as a thin crescent, with the horns pointing toward the east, and as she increases her angular distance from the sun at the rate of about 12° daily, the crescent of light becomes broader, till, after the lapse of a little more than seven days, at which time she is 90° in advance of the sun, she presents the appearance of a semicircle of light. The moon is then said to have completed her **first quarter**. Continuing her course, she becomes "gibbous" (q.v.); and at the 15th or 16th day from new moon, attains a position 180° in advance of the sun, and now presents the appearance known as **full moon**. From this point she begins to approach the sun, again appearing gibbous, and after a third period of more than seven days, reaches a point 90° W. of him, and enters her **last quarter**. Here, again, she appears as a semicircle of light, the illuminated portion being that which was not illuminated at the end of the first quarter. The moon now rapidly approaching the sun, resumes the crescent form, but this time with the horns pointing westward, the crescent becoming thinner and thinner, till the moon reaches the position of new moon, and disappears. From "full moon" to "new moon," the moon is said to be **waxing**; and from "new moon" to "full moon," **waning**. The earth as seen from the moon presents similar phases, and has, consequently, at the time of new moon, the appearance of a round illuminated disk, and at full moon is invisible. This explains the peculiar phenomenon occasionally observed when the moon is near the sun (either before or after new moon), of the part of the moon falling which is unillumined by the sun appearing faintly visible, owing to the reflection of light upon it of strong parallel light. This phenomenon is often seen to advantage in the Scottish peasant's case, "the moon wi' the auld mune in her arms." At new moon, the moon of course comes above the horizon about the same time as the sun, and sets with him, but rises each day about 50 minutes later than on the day previous, and at the end of the first quarter, rises at midday, and sets at midnight, continuing to lag behind the sun. When at the full, she rises about sunset, and sets about sunrise, and at the commencement of her last quarter, she rises at midnight, and sets at midday.

**Distance and Magnitude.**—From repeated observations of the moon's **horizontal parallel** (q.v.), and of the occultations by her of the fixed stars, her mean distance from the earth has been estimated at 327,000 m., and as her angular diameter averages 31° 26', her actual diameter is 2,153 m., or a little less than \(\sqrt{3}\) lbs. of the earth's diameter. Her volume is therefore about \(\frac{1}{4}\) th of that of the earth, and her density being only \(\sqrt{\frac{3}{7}}\) (that of the earth being taken as unity), her mass is only \(\frac{1}{4}\) th of the earth's mass; consequently, the force of gravity at her surface is so much less than it is at the surface of the earth, that a body which weighs 1000 lbs. here, would at the moon weigh only 163 lbs.

**Orbit.**—The moon revolves round the earth in an elliptic orbit, with the earth in the focus; the eccentricity of the ellipse being equal to 0.05491 of half its major axis, or more than 23 times that of the earth's orbit. The plane of her orbit does not coincide with the ecliptic, but is inclined to it at an angle of 5° 8' 47.9", and intersects it in two opposite points, which are called the **nodes** (q.v.). The point at which the moon is nearest to the earth is called her **perigee**, and that at which she is farthest from it her **apogee**, and the line joining these two points is called the **line of apsides**. Were the moon's orbit a true ellipse, which, owing to various irregularities known as **perturbations**, it is not, the **linear theory** would be exceedingly simple; but these perturbations, which, in the case of the planets, produce a sensible variation in their orbit only after many revolutions, cause, in the case of the moon, a distinct and well-marked deviation from her previous course in a single revolution. The retrogradation of her nodes along the ecliptic causes a continual change in the plane of her orbit, so that if, during one revolution round the earth, she occults certain stars, at the next revolution she will pass to one side of them, and will remove further and further from them in each successive revolution. A little consideration will show that by this continual change of her orbit, the moon will, in course of time, pass over or occult every star situated within 5° 24' 30" of the ecliptic. The motion of the nodes is so rapid that they perform a complete circuit of the orbit in 6783.39 mean solar days, or 18.6 years. Another important change in the moon's orbit is the revolution of the line of apsides, by which the perigee and apogee are continually changing their position relative to the earth and sun. This revolution is more than twice as rapid as that of the nodes, being performed in 292.57 mean solar days, or 8.85 solar years. As this motion is common to all the heavenly bodies, its nature and origin will be treated under the head of perturbations (q.v.). Its effect upon the moon is to produce a variable distance in her distance from the earth, independent of that produced by her elliptic motion.

**Eclipses.**—As the moon in her course passes the sun at the commencement of every (synodic) month, and by the middle of the month has placed the earth between herself and the sun, it is evident that if she moved in the plane of the ecliptic, there would be either a **total** or an **annular eclipse of the sun** at the commencement, and a **total eclipse of the moon** in the middle of every month. The inclination of her orbit allowing her to pass the

---

8 When the moon is at the **perigee**, she is within 325,000 m., and at the **apogee**, more than 257,000 m., from the earth; her angular diameter as measured from the earth consequently varies from 38° 45' to 32° 30' and for a particular day is greatest when she is on the meridian, as in this case she is nearer to the spectator, by about 4,000 m., than when she is on the horizon.
sun 5° 9' to the n. or s. of its track, prevents such a frequent occurrence of eclipses. If
the moon, when in conjunction, is at either of her nodal points, and at the same time
near her perigee, a place in which it reaches parallax, if her apogee, the eclipse
is only annular, for at that time her apparent diameter is less than the sun's. If also
at her conjunction, her latitude n. or s. is less than the sum of her semi-diameter and of that
of the sun, a partial eclipse takes place, and is greater the nearer the moon is to her
node. These partial eclipses are seldom seen from all parts of the earth's illuminated
surface, but are confined to a portion of it, which is greater or less according to the
extent of the eclipse. Lunar eclipses, which occur when the moon is in opposition (i.e.,
at full moon), are seen equally from all parts of the earth's surface which are turned
towards her. The conical shadow of the earth which is projected into space on the
side opposite to the sun, is in length equal to about 33 times the moon's mean distance,
and a section of it at the moon's distance is 1° 29' in diameter. If, then, the moon,
which is never more than 32½' in diameter, happens to be at or near her node, a total
eclipse will be produced, and it be apparent, as sometimes the case with
those of the sun. Even during total eclipses, the moon is seldom quite invisible, but
generally shines with a faint copper-colored light. See Eclipses.

Rotation.—The moon, like all other satellites, as far as at present known, revolves
round her own axis in precisely the same time that she revolves round the earth; she
thus presents always the same face to us, and consequently, though her comparative
proximity has enabled us to become better acquainted with her surface than with that
of any other heavenly body, our knowledge is confined to one half of her surface, with
the slight exception of the knowledge obtained from her libration (q.v.). To the inhabi-
tants of the side of the moon next the earth—if the moon had inhabitants, which is very
improbable—the latter would appear as a luminous 3° 2' in diameter, immovably
fixed in their sky, or at least changing its position only to the extent due to the moon's
libration. The earth would thus seem to them to have a disk about 15 times larger than
that of the sun.

Physical Features.—The surface of the moon, as seen from the earth, presents a most
irregular grouping of light and shade. The dark portions were named by the earlier
astronomers as seas, lakes, etc., and still retain these names, although there is strong
evidence against the supposition that the moon, or at least that portion of it presented
to us, contains any water. The brighter parts of the moon are mountainous, as is proved
by the fact of their casting shadows when the sun's rays fall upon them obliquely, and
also by the ragged appearance presented by the interior illuminated border of the moon,
an appearance which can only be satisfactorily accounted for on the supposition that
the surface of the moon is not level, in which case the higher portions will be illumi-
nated some time before the light reaches the level parts; and it is observed that as the
illumination proceeds, bright spots start up in advance of it, and when the moon is on
the wane, these same spots continue to shine for some time after the surrounding sur-
faced is immersed in gloom. The mountains occur either singly, when they are generally
of a circular form, and are called craters, or in groups, which are mostly annular, and
form a sort of wall inclosing a deep depression or plain, in which are situated one or
more conical mountains. The crater s are not unfrequently 8 or 10 m. in diameter, and
some of the walled plains measure more than 100 m. across. The principal mountain
range is the Apennines, which crosses the surface from n.e. to s.w., and attains, accord-
ing to some authorities, an altitude of about 20,000 ft., though Sir John Herschel gives
about 2 m. as the probable limit of elevation above the moon's surface. The heights are
estimated from a micrometric measurement of the length of their shadows, a method
not, in this case, susceptible of much accuracy. The moon everywhere presents traces
of volcanic agency, but no active volcanoes have yet been discovered, nor is there any
sign of recent volcanic action. Seen through the telescope, she presents a bleak, dese-
late appearance, without indications of animal or vegetable existence. She appears to
be devoid of an atmosphere, or, if one exists, it must be of exceedingly rarity.

The influence of the moon in causing tides (q.v.) has long been well known, and
there is some reason for supposing that she produces a similar effect on the atmosphere,
combining with other causes in the generation of winds. Those winds which prevail
about the time of new and full moon, and at the vernal and autumnal equinoxes, are
particularly ascribed to her influence. On the supposition that the moon might affect
organic nature, experiments were instituted by Mead, Hoffmann, and others; but
no certain results were attained. The periodicity which has often been noticed in certain
diseases, especially in insanity (hence called lunacy), was long supposed to have some
connection with lunar influence, and this opinion is held to some extent at the present
day. But from the chemical and physical effects which its rays are, so far as is at present known, fee-
ble, though in particular instances they exhibit an actinism as powerful as that of the sun.
Decomposition of animal matter takes place more rapidly in moonshine than in
darkness, and the moon's rays, when concentrated, have a sensible effect on the ther-
mostat.

The best map of the moon is the large and accurate one of MM. Baer and Mädler,
which presents a most minutely detailed picture of her visible surface; the map is 3 ft.
in diameter. See for further information the articles Perturbations; Libration;
Nodes; Ejection; Metonic Cycle; Tides, Lunar, etc.
Superstitions regarding the Moon.—The moon was anciently an object of worship, and even in the 17th c. she was supposed, by the common people of England, to exercise great influence over human affairs. The times for killing animals for food, gathering herbs, cutting down wood for fuel, sowing seeds of various kinds, were all regulated by the "age" of the moon, and these set periods were considered to be a necessary part of practical knowledge, and ignorance or neglect of them to be infallibly productive of loss. There were similarly defined periods for taking particular medicines, and attempting the cure of particular diseases. Many such superstitions prevailed until a recent period in the Highlands of Scotland, favorable or unfavorable consequences from any occurrence being predicted according to the age of the moon at the time it happened. "Throughout Scotland, the waning moon was considered to have an evil influence, and full or new moon to be the most auspicious season for commencing any enterprise. The same opinion was held in Scandinavia and Germany, and the history of all nations teems with similar superstitions. See the article Eclipses.

In the Edda, we read that "Mundilföri had two children—a son, Mani (moon), and a daughter, Sól (sun);" and in German, the moon is masculine and the sun feminine to this day. It was the same in Ang.-Sax.: although modern English has in this matter followed the classic mythology, in which Phœbus and Sol are gods; and Selene, Luna, and Diana are goddesses; Grimm (Deutsche Mythologie, p. 696) quotes an old invocation to the "New Moon, gracious lord!" (Neuer Mon, holder hern), for increase of wealth; and down to recent times the German people were fond of speaking of "Frau sonne," and "herr mond!" ("lady sun," and "lord moon") and of calling themselves German, Lithuanians, and Armenians, and even the modern Mexican mestiz (moon) was masculine. Among the Shaves, according to Grimm, the moon is mas., a star fem., and the sun neut. In Hindu mythology also, the moon—Chandra or Soma—is a male deity, represented by one myth as the son of the patriarch Ati, who procreated him from his eyes, but by another as arising from the milk-sea when it was churned by the gods for the attainment of the beverage of immortality. His wives are the 27 daughters of the patriarch Daksha, known as the nymphs of the lunar constellations. By one of them, Rohini, he had a son Buddha (not to be confounded with Budhha, the regent of the planet Mercury, who begot on Iâ, a son, Pururâvas, who became the ancestor of a royal family, hence called the lunar dynasty.—The moon is generally represented as wearing white garments, with a mace in one hand, and riding in a chariot drawn by ten horses or antelopes. The animal sacred to him is the hare (the Hindus believing that this creature lives on the moon); and the plumes under his temples and on his ear ornamentage is a certain variety of the lotus, which flowers when the moon rises, and the soma plant, or asclepias acida. As the receptacle of the beverage of immortality, he is thus described in the Vishnu-Purâna: "The radiant sun supplies the moon, when reduced by the draughts of the gods to a single digit, with a single ray; and in the same proportion as the ruler of the night is exhausted by the celestials, it is replenished by the sun . . . ; for the gods drink the nectar accumulated in the moon during the half month; and from this being their food, they are immortal: 38,000, 3,300, and 33 divinities drink the lunar nectar. When two digits remain, the moon enters the orbit of the sun, and abides in the ray called Amâ . . . . In that orbit, the moon is immersed for a day and night in the water, thence it enters the branches and shoots of the trees, and thence goes to the sun . . . . When the remaining portion of the moon consists of but a 15th part, the manes approach it in the afternoon, and drink the last portion, that sacred digit which is composed of nectar; in this manner the moon, with its cooling rays, nourishes the gods in the light fortnight (or the 15 days of the moon's increase), the manes in the dark fortnight (when in the wane); vegetables, with the cool nectary aqueous atoms it sheds upon them; and through their development it sustains men, animals, and insects, at the same time gratifying them by its radiance."

MOON JAH, MUNJAH, OR MOONYAH (saccharum munja), a grass of the same genus with the sugar-cane, a native of India, the leaves of which afford a useful fiber, of which ropes are made. The moonjah grows in vast abundance in the neighborhood of the Ganges, Indus, and other rivers. The fiber of the moonjah is very tough and strong. No proper trial seems yet to have been made of the qualities of the moonjah fiber, more carefully prepared; but considering the facility with which it could be obtained in any desirable quantity, it seems to deserve attention.—Very similar to the moonjah is the SARA or SHUR of Bengal (saccharum avara), another species of the same genus, the leaves of which are employed in the same way.

MOON, MOUNTAINS of. The "Mountains of the Moon" have ever played an important part in the history of African geography, and have given rise to many curious hypotheses. Ptolemy, and until lately many of the ablest geographers, supposed that a very high chain of mountains crossed the continent of Africa from c. to w.; and they have continued to shift these mountains from one latitude to another, ranging from 10° n. to 10° s., but still keeping them within nearly the same meridional bounds. Dr. Beke, from his own researches and a minute study of the geography of eastern Africa, propounded the theory, that the so-called Mountains of the Moon run from n. to s. parallel to the coast of Zanzibar, instead of from c. to w.; forming, in fact, a continuation of
the great Abyssinian table-land, and embracing the snow-capped mountains of Kenya and Kilimanjaro, which have an altitude of 20,000 feet.

The mass of mountains discovered by cap't. Speke in 1858, round the head of lake Tanganyika, is considered by him, both from its crescent form and its position, to be part of the Mountains of the Moon of Ptolemy; but mountains of this height (6,000 to 10,000 ft.) could never be snow-clad so near the parallel of the equator.

MOOINSEED, or yellow parilla, *menisperma canadense*; nat. order *menispermaeae* (q.v.). The Canadian moonseed is a North American climbing plant having peltate, roundish-cordate, and angular leaves, small clusters of greenish-yellow flowers, and black, glaucous, roundish, kidney shaped drupes (stone fruit). The root was formerly known in commerce as Texas sarsaparilla; its botany was established by R. P. Thomas in 1855. The root is several feet long, about a quarter of an inch thick, cylindrical when dry, with longitudinal wrinkles, and thin, branching rootlets. It contains a small quantity of berberine, and a larger quantity of a white alkaloid soluble in ether, alcohol, and much water. It also contains starch, and other constituents which have not been examined. It is regarded as a tonic, alterative, and diuretic, similar in properties to sarsaparilla, and is used in scrofulous affections as a substitute for that plant.

MOONSEED. See *FELDSPAR*.

MOORCROFT, WILLIAM, about 1780–1825; b. England; one of the earliest veterinary surgeons, and also one of the earliest explorers of the Himalayas, and the lakes, rivers, and valleys of Chinese Tartary. An account of his travels was published in London in 1841, edited by prof.'H. H. Wilson, entitled *Travels in the Himalayan Provinces of Hindostan and the Punjab, in Ludhah and Kashmir*.

MOORE, a co. in central North Carolina, drained by Cape Fear, Deep, and Little rivers, and many creeks; and traversed by the Raleigh and Augusta railroad; 760 sq.m.; pop. '70, 12,040. The surface is hilly and broken, covered in great part by forests. Cotton, Indian corn, wheat, and pork are the staples; coal has been found. Chief town, Carrigal.

MOORE, a co. in s. central Tennessee, organized in 1872; drained by the Elk river and its creeks, and traversed by the Nashville, Chattanooga and St. Louis railroad; 160 sq.m.; pop. '80, 6,235–785 colored. The surface is broken and hilly, covered in great part by forests of oak, chestnut, walnut, and other valuable timber. The staple products are wheat, corn, and oats; limestone is found. Co. seat, Lynchburg.

MOORE, ALFRED, 1755–1810; b. N. C.; became capt. in 1775 in a North Carolina regiment whose col. was his uncle, col. James Moore. He afterwards threw up his commission, but, after the capture of Wilmington by the British, he enlisted a volunteer force, which did good service during the remainder of the war. In 1790, when his knowledge of the law was still extremely scanty, he was elected by the state legislature attorney-general, and he soon acquired sufficient legal learning to discharge with credit the duties of that office. In 1798 he took a seat on the bench of the state court, from which he was promoted the next year to the supreme court of the United States, where he remained till 1805.

MOORE, BENJAMIN, d.d., 1748–1816; b. Long island; graduated at King's, now Columbia college, in 1768; admitted to the ministry as deacon and priest in England, in 1774, by the bishop of London; returned to America and was assistant minister of Trinity church, New York, 1774–1800; became rector in 1800. In 1801 he was consecrated bishop of the Protestant Episcopal church of New York, and also appointed professor of logic and rhetoric in Columbia college. He was president of the college, 1800–11, continuing also to perform the duties of the ministry. Dr. Hobart, who succeeded him, was his assistant after he became disabled from paralysis. He was an accomplished scholar and an able preacher. He published two sermons in the *American Preacher; also, an Sermon before the General Convention; A Pamphlet in Vindication of Episcopal Services*. His *Posthumous Sermons* were published by his son, Clement C. Moore.

MOORE, CHARLES WHITLOCK, b. Boston, 1801; a prominent freemason, and for many years secretary of the Massachusetts grand lodge. He established *Zion's Herald*, at Boston, in 1833, and the *Freemason's Monthly Magazine* in 1841: He has published a number of masonic manuals.

MOORE, CLEMENT CLARK, LL.D., 1779–1853; b. in New York; son of bishop Moore of R. I.; educated at Columbia college, graduated in 1798, and, having made a specialty of the study of Hebrew, was appointed professor of biblical learning in the Protestant Episcopal theological seminary of New York (1821), having already, in 1809, published a Hebrew and English lexicon. In this institution he remained, some changes being made in the title of his professorship, until 1850, when he retired with the title of professor emeritus. The plot on which the seminary stands was the gift of Dr. Moore. He was a poet of merit; published a collection of poems in 1844, and in 1850 *George Chaspe*. By far the best known of his poetical writings is the ballad beginning: "'Twas the night before Christmas; and all through the house," etc.

MOORE, Frank, b. N. H., 1828; brother of George Henry. Became a journalist and general writer, in early life; in 1869 was appointed secretary of legation at Paris, and resided there, in the performance of his official duties, during the period of the Franco-German war and the commune. He edited and prepared the Rebellion Record, a voluminous and valuable chronicle of the American rebellion of 1860-65, published in 12 vols., 1861-71. He published Diary of the American Revolution, 2 vols.; Songs and Ballads of the American Revolution; Lyrics of Loyalty (songs of the war against rebellion); and Rebel Rhymes and Rhapsodies—a similar collection made from among the writers of the confederate side. In recent years he has devoted himself to journalism in New York, and is at present (1881) an editorial writer on the N. Y. Commercial Advertiser.

MOORE, George Henry, J. D., b. N. H., 1823; went to New York at the age of 16 years, and assisted his father, then librarian of the N. Y. historical society, whom he succeeded in that position in 1849. He remained in this office until the foundation of the Lenox library, when he was named by the late James Lenox, esq., founder of the library, to be its first superintendent, which position he still holds (1881). He received his degree of LL.D. from the university of New York. He is a learned bibliographer and a skilled administrator, and to his capacity the N. Y. historical society owes in a great degree its progress from an insignificant beginning to a secure and eminent position among the leading literary institutions of the country. Mr. Moore has been a writer on certain special subjects concerning which he is a recognized authority. He published The Treason of Charles Lee; Employment of Negroes in the Revolutionary Army; Notes on the History of Slavery in Massachusetts; and History of the Diocese of New York.

MOORE, Sir Henry, 1713-69; b. Jamaica; was made a baronet for suppressing a slave insurrection while governor of Jamaica; and next received the appointment of governor of New York, an office he retained from 1769 until his death.

MOORE, Henry, 1751-1843; b. in Dublin; became a Wesleyan Methodist; was admitted to probation in 1779, and for some years preached in Ireland, after which he was associated personally in John Wesley's work. As a revivalist and a preacher he had great success, and was the last to die of those whom Wesley had ordained. He wrote the Life of John and Charles Wesley and Memoirs of the Family (1824); Memoir of Mary Fletcher; and an autobiography, accompanied by an account of his life written by Mrs. Richard Smith (1841).

MOORE, Jacob Bailey, Jr., 1797-1853; b. N. H.; learned the printer's trade in Concord, where he worked in the office of the Patriot, a newspaper to which he contributed. He married into the family of the proprietor, and was taken into partnership by him but left the paper to found the N. H. Statesman, for the purpose of pressing the election of John Quincy Adams to the presidency. In 1828 he was made a member of the state legislature, and in the following year sheriff of Merrimack co., a position which he held for five years. He also edited the N. H. Journal; and in 1839 went to New York, where, for a brief period, he edited the Daily Whig. In 1841-45 he was employed in the post-office in Washington. In 1845 he was appointed librarian of the N. Y. historical society library, and in 1848 postmaster at San Francisco, Cal. He was one of the compilers of Farmer and Moore's Historical Collections of New Hampshire, one of the earliest publications in American local history. He also published a History of Concord, N.H.; Lives of Trade in the United States; History of Andover; Gazetteer of New Hampshire; and Memoirs of American Governors.

MOORE, Jesse Hale, b. Ill., 1817; educated at McKendree college, Lebanon, and in 1844 became principal of Georgetown seminary. He became pastor of the Methodist Episcopal church at Salado College 1848, and was successively principal of Paris seminary and president of Quincy college. In 1862 he raised the 115th regiment of Illinois volunteers, and served through the war, retiring at its close with the brevet rank of brig. gen. He served in Congress, 1869-73.

MOORE, John, M. D., a Scottish physician and miscellaneous writer, son of the rev. Charles Moore, an Episcopalian clergyman, was born at Stirling in 1730. Educated at the university of Glasgow, he began the study of medicine and surgery under Dr. Gordon, surgeon of that city, which study he followed up in Holland, London, and Paris, and then, as the partner of his old master, Dr. Gordon, began to practice in Glasgow. As medical attendant to the duke of Hamilton, he spent five years traveling on the continent, and on his return in 1778 settled in London. In 1779 he published A View of Society and Manners in France, Switzerland, and Germany ( Lond. 2 vols. 8vo). In 1781 appeared A View of Society and Manners in Italy (2 vols. 8vo); in 1786 his Medical Sketches, in two parts; and in 1789 Zeuxis, a novel (2 vols. 8vo)—the principal, or, at any rate, the most popular of his works. His other works are: A Journal during a Residence in France, 1792 (2 vols. Lond.), descriptive of scenes witnessed while at
Paris in the autumn of that year as medical attendant of the earl of Lauderdale: A
View of the Causes and Progress of the French Revolution (2 vols. Lond. 1793); Edward,
a novel (Lond. 1796); and Mordant, a novel (Lond. 1800; 3 vols. 8vo). He also edited a
collected edition of Smollett's works, with a life of the author. He died at Richmond
in Surrey, Feb. 29, 1802.

MOORE, Sir JOHN, English gen., born at Glasgow 1761, was eldest son of the
preceding. He entered the army as ensign when only 15, and served with distinction in
Corsica as col.; in the West Indies as brig.gen.; in Ireland during the rebel-
lion of 1798, and in the expedition to Holland as gen. of staff. He was in Egypt
with the army under Abercromby, and obtained the order of the bath for his services in
command of the reserve. When war again broke out in 1802 Moore served in Sicily and
Sweden. In 1808 he was sent with a corps of 10,000 men to strengthen the English
army in the peninsula. He arrived in Mondego bay Aug. 19, and assumed the chief
command on the return to England of sir H. Burrard. In October he received instructions
to co-operate with the forces of Spain in the expulsion of the French from the peninsula.
He moved his army from Lisbon, with the intention of advancing by Valladolid to unite
himself with the Spanish gen. Romana, and threaten the communications between
Madrid and France. But the apathy of the Spaniards, and the successes of the French
in various parts of the peninsula, soon placed him in a critical position. Yet he had
determined to make a bold advance from Salamanca to attack Soult, when the news
reached him that Madrid had fallen, and that Napoleon was marching to crush him at the
head of 75,000 men. Moore's force amounted to only 33,000 men, and he was consequently
forced to retreat. In December he began a disastrous march from Astorga to Corunna,
a route of nearly 250 miles, through a desolate and mountainous country, made almost
impassable by snow and rain, and harassed by the enemy. The soldiers suffered intoler-
able hardships, and arrived at Corunna in a very distressed state. It was impossible to
embark without fighting, and Soult was in readiness to attack as soon as the troops
should begin to embark. The battle was mainly one of infantry, for the cavalry, after
destroying their horses, had gone on board, and the bulk of the artillery, for which
the ground was not adapted, had also been withdrawn. On Jan. 16, 1809, the
French came on in four strong columns. A desperate battle ensued. While animating
the 43d regiment in a brilliant charge in an early stage of the action Moore was struck
by a cannon-ball on the left shoulder, and died in the moment of victory. The French were
defeated with the loss of 2,000 men; and the funeral obsequies of the deceased soldier
were performed with melancholy solemnity just before the embarkation of his troops.
The British army in this expedition lost their magazines and 6,000 soldiers. A monument
was erected to Moore's memory in St. Paul's cathedral.

MOORE, MARTIN, 1790-1866; b. Mass.; graduated at Brown university in 1820;
was pastor of a Congregational church at Natick, Mass., for nearly 30 years, and after-
wards at Cohasset. He edited the Boston Recorder for 20 years. He published History of
Natick; Life of John Eliot. He was vice-president of the New England genealogical
society in 1801-6.

MOORE, Nathaniel, F.f.L.d., 1782-1872; b. New York; educated at Columbia college,
and admitted to the bar. In 1817 he was appointed adjunct professor, and in 1820 full
professor of Greek and Latin in Columbia college, where he remained till 1835, when he
went abroad. On his return in 1837 he became librarian of the college, to whose presi-
dency he was called in 1812. He held that office till 1819. He published A Historical
Sketch of Columbia College; Ancient Micromancy; Lectures on the Greek Language and Liter-
ature; and Remarks on the Pronunciation of the Greek Language.

MOORE, Richard Channing, d.d., 1762-1841; b. New York; educated at King's, new
Columbia, college; became a physician; entered the ministry of the Protestant Episcopal
church; was pastor at Rye, N.Y.; rector of St. Andrew's, Staten island, 1789-1809;
rector of St. Stephen's, New York, 1809-14; consecrated bishop of Virginia in 1814 as suc-
cessor of bishop Madison. He was a prominent leader in the evangelical branch of the
Episcopal church. During the last twelve years of his life he had as an assistant bishop
Meade, who succeeded him as bishop of the diocese. He published many Charges, and a
sermon on The Doctrines of the Church.

MOORE, Thomas, the son of a small tradesman, who, through the influence of lord
Moira, afterwards became a barrack-master in the army, was born in Dublin on May 28,
1779. At an early age he was placed at a school in which Sheridan had formerly
been a pupil. In 1795 he was sent to the Dublin university, where he ultimately took
the degree of B.A. Before entering the university he had written verses for a Dublin
magazine; and while there he translated the Ode of Anacreon, in the hope of obtaining
a classical premium, in which, however, he was disappointed. In Dublin he acquired
Italian and French, and being fond of music, he learned to play on the piano—an
accomplishment which was of service to him in his future career.

In 1798, with his translation of Anacreon in his pocket, he came to London to study
law, and entered himself in the Middle Temple. In 1800 he published his translations,
dedicated to George IV., then prince of Wales. In 1802 he produced his Poetical Works
of the Late Thomas Little—a volume of sweet but licentious verse, which was a good deal
Moore.
Moorsheadab.

192

blamed, and very widely read. In 1803, through the influence of lord Moira, he was appointed to a government post at Bermuda. He arrived there in Jan., 1804; but finding his situation disagreeable, he committed his duties into the hands of a deputy, and traveled in America previous to his return to England. His transatlantic experience seems to have cured him of the democratic ideas which he had imbued in Dublin. On his return to England, he published Odes and Epistles, for which he was sharply taken to task in the Edinburgh Review. A duel between himself and Jeffrey was the consequence—over which Byron made so much mirth—and which resulted in the combatants becoming the most excellent friends. In 1807 he engaged with Mr. Power to produce the Irish Melodies, and on this work he was engaged at intervals up till 1834. In 1811 he married, and shortly after he went to reside in Derbyshire, where in 1813 he produced The Two peny Post-boy, full of brilliant fancy—in which the tropes not only glittered but stung.

As up to this time he had produced nothing but fugitive pieces he became anxious to emulate his brethren, who wrote long poems, and published in quarto. He fixed on an oriental subject, and the Messrs. Longman agreed to purchase the poem for 3,000 guineas. In 1817 the long-expected Laila Rookh appeared—brilliant as a fire-fly, and the whole English world applauded. After the publication he went to Paris, where he wrote The Fudge Family, which appeared in 1818. At this time he learned that his deputy in Bermuda had misconducted himself, and that he had become liable for a large sum, which was afterwards, however, considerably reduced. Lord Landsdowne paid the claim, and Moore repaid his lordship afterwards.

In 1819 Moore went to Paris with lord John Russell, and extended his tour to Italy, and saw lord Byron at Venice. He returned to Paris, where he brought his family, and fixed his residence till 1822. Here he wrote The Loves of the Angels, which appeared in 1823, and The Epiphan, a prose romance, which was not published till 1827. On his return to England he fixed his abode at Sloperation cottage, near Bowood, and issued the Memoirs of Captain Rock in 1824, and the Life of Sheridan in 1825.

Byron had handed over to Moore, for his own especial benefit, a manuscript autobiography, on the condition that it should not see the light till after his author's death. Byron died in 1824, and as, at the request of his lordship's relatives, the manuscript was destroyed, Moore then entered into arrangements with Murray to produce a life of the deceased poet. The Life of Lord Byron was published in 1830, in two volumes. Next year he published the Life of Lord Edward Fitzgerald. His last important work was a History of Ireland, published in Lardner's Cyclopaedia. A pension of £300 per annum was conferred on him in 1835. In 1841 he brought out an edition of his entire poetical works. For the three years preceding his death, he was afflicted with softening of the brain. He died Feb. 25, 1852. His friend, lord John Russell, published his Memoirs, Journal, and Correspondence, in 8 vols. (1852-56).

Despite his popularity during his lifetime, Moore can hardly be placed in the rank of great poets. His muse is a spangled dancing-girl—light, airy, graceful, but nothing more. His most ambitious work, The Loves of the Angels, is far beneath the Miltonic, or even the Byronic standard. Laila Rookh is brilliant, but fattening. He is most successful in polished satire and the lighter sentiments; and his reputation will ultimately rest on The Two penny Post-boy and the Irish Melodies.

MOORE, WILLIAM, b. Penn., in the 18th e.; father of the marchioness de Marbois. He was president of the state executive council for two years, from 1781, and long a merchant in Philadelphia.

MOORE, ZEPHANII SWIFT, D.D., 1770-1822; b. Mass.; graduated at Dartmouth college in 1773; was pastor of the Congregational church at Leicester, Mass., in 1798; elected professor of languages in Dartmouth college in 1811; president of Williams college in 1815, and of Amherst in 1821. He was especially interested in natural science. He published An Oration at Worcester; An Address to the Public in respect to Amherst College; and two occasional Sermons.

MOORFOWL, RED GROUSE, or, in books of natural history, RED PTARMIGAN or BROWN PTARMIGAN (Lagopus Scoticus), a bird peculiar to the British islands, and affording more amusement to sportsmen than any other kind of feathered game in Britain. It is the bird generally known in Britain by the name grouse, although not a true species of grouse, but rather of ptarmigan (q.v.). The toes are completely feathered, as well as the tail, but the bill is very short, and its base much concealed by feathers. The length of the moorfowl is about 16 in., of which about 4 in. belong to the tail. The tail is nearly square. The wings are short. The plumage is of a deep chestnut-brown color, marked on the back and wing-coverts with black spots, and on the under parts with undulating black lines; the four middle tail-feathers are also marked with transverse black lines. Above the eyes is a naked space (the cere), of a bright scarlet color. The moorfowl is plentiful in the moors of Scotland and the Hebrides, Wales, the north of England, and Ireland. It feeds on the tender tops of heath, crowberries, bilberries, etc.; and not unfrequently visits the fields of oats and other grain in the vicinity of the moors, particularly when the stools remain long in the field in late and rainy harvests. The moorfowl is not polygamous, and pairs in spring, when the plumage—particularly of the male—assumes a lighter and redder tint. The female lays from eight to fifteen eggs. The
nest is on the ground, often under shelter of a tuft of heath. The young run about very soon after they are hatched. "Grouse" remain in the woods (broods) from the time they are hatched till late in the autumn, after which they "pack" or assemble in large bodies. A cream-colored variety of moorfowl is sometimes found in the north of England. The moorfowl is easily domesticated, and breeds readily in an aviary, if supplied with heath for food.  

MOORE. Moorshedabad.  

MOOREN. See Gallinule.  

MOORING (allied probably to Dutch marren, to delay, fasten; Eng. marine, for fastening the sail to the bolt-ropes; Lat. moero, delay), a fastening to retain a ship in a given position. This may be either by her own anchors, or (which is the more common meaning of the term) by fixed and permanent buoy, which, on its part, is anchored to the bottom. A chain-moorings is where a strong chain is stretched for some distance on the bottom, being securely anchored or otherwise made fast at each end, and perhaps in intermediate places. Numerous buoys are then floated from it, and it becomes the mooring-ground for many vessels. Chain-moorings are frequent in all large harbors where comparatively small vessels require to ride.  

MOORISH ARCHITECTURE. See Arabian Architecture.  

MOORS (Lat. maurus, meaning dark; Spanish, moro) are a people who form the great majority of the population of Barbary. Their appearance indicates their origin, which is a mixture of the Mauri (from whom they derive their name), Numidians, Phenicians, Romans, and Arabs, who have successively held possession of the country. In consequence, they are found to vary considerably in appearance and character in different parts of Barbary, but all show more or less strongly the symptoms of a considerable infusion of Arabian blood. They are a well-formed race, with fine oriental features, and a mild and melancholy expression of countenance. They are more friendly and sociable than Vandals and Berbers, who inhabit the deserts and mountains; but are inferior to them in mental ability, besides being voluptuous and cruel. They constitute, generally speaking, the tradesmen, artizans, merchants, and agriculturists of Barbary; but a considerable number lead a pastoral life. The dress of the Moors consists of a piece of woolen cloth, five cloths, in length by one and a half in breadth, called a "haique," which is thrown over the shoulders, and fastened round the body; it also serves as a covering by night. This, when supplemented by a pair of drawers, a red cap, and a hood, constitutes the sole habiliment of the people generally. In the towns, the "caftan" is generally worn over the haique. The Moors employ the Arabic language, but with many corruptions and deviations from the original, and these appear to increase toward the west.  

As the Arab conquerors of Spain invaded that country from Africa, where they had largely recruited their forces, they were naturally enough called Moors, and in Spanish history the terms Moors, Saracens, and Arabs are synonymous. From this mixed Moorish-Arab race sprung the Moriscos, who were permitted by Ferdinand the Catholic to remain in Spain after the expulsion of their countrymen, on condition of their embracing Christianity. A cruel persecution, which was originated by Philip II., drove them to rebellion (1567-70), and in 1571 many emigrated to Africa; those who remained being, to the number of 500,000, expelled in 1610 by Philip III.  

The Moors first appear in modern history as the allies of the Vandals in their invasion of Africa, and were continually rebelling against the Byzantine emperor. They were next, after a severe struggle, conquered and converted by the Arabs in 707. In 1091 they were summoned by the latter into Spain, to aid in stemming the tide of Christian conquest; and after faithfully supporting the Arab calif of Cordova, etc., till his dominions fell into the hands of the kings of Leon and Castile, they retired in 1228 to Granada, where they founded their kingdom. The kings of Granada carried on a vigorous and, at the same time, chivalrous warfare with the kings of Castile; but at length, weakened by internal discord, were compelled to succumb to Ferdinand the Catholic in 1492. The Moors, or at least that portion of them who refused to adopt Christianity, were then expelled from Spain, and, in revenge, founded in 1518 the piratical states of Algiers and Tunis. Their subsequent history cannot be separated from that of Algiers, Tunis, and Morocco.  

MOORSHEDEBAD, a city in Hindustan, in a district of the same name, and in the province of Bengal, of which it was formerly the capital; 124 m. n. of Calcutta; pop. 46,182. Its name originally was Mukoosabad. Including Cossimbazar it extends 8 m. on both sides of Bhagiratty or Cossimbazar river, a branch of the Ganges. The city was never fortified except by an occasional rampart during the Malhurra invasion in 1742. The streets are so narrow as to be impassable for European carriages. The buildings are generally of mud. Most of them are of one story, with tiled roofs. Even the palace of the nawab is hardly noticeable. A long, narrow, winding street runs from the main entrance, containing poor huts, and this is crossed by other streets still narrower and very unsanitary. On account of defective drainage the place is very unhealthy, and in 1814 many Europeans suffered in the general mortality. It has an extensive inland traffic, and the river is constantly covered with boats. The staple products are silk and indigo. The town is favorably situated for commerce. A Mohammedan college, called  

U. K. X.—13
Nizamat college, was founded here several years ago, to which an English professorship was attached. In 1757 Calcutta became the capital of Bengal.

**MOORUK** (Casuarina Benphetti), a recently discovered bird of the same genus with the Cassowary (q.v.), of which it was at first regarded as a mere variety, a native of the island of New Britain. It is about 5 ft. in full height, 3 ft. to the top of the back, and is of a reddish color, mixed with black, and has a horny plate instead of a helmet-like protuberance on the top of the head. The claw of the inner toe of each foot is very long. It becomes extremely tame and familiar in captivity; may be fed on potatoes, maize, or any similar food; and is apt to prove troublesome by swallowing anything, however indigestible, that may come in its way.

**MOOSE.** See Elk.

MOOSEHEAD LAKE, the largest lake in Maine, from which the Kennebec river takes its rise. It lies on the borders of Somerset and Piscataquis counties, about 75 m. n. by e. of Augusta; is 36 m. in length, from 3 to 10 m. in width; and is surrounded by a thickly wooded country that is sparsely inhabited. The forests abound in game, including the deer and caribou; and the lake, with the neighboring region, is much frequented by sportsmen. In the winter the lumbermen of the Kennebec cut much of their timber near its banks.

MOOSH, a t. of Asiatic Turkey, capital of a small pashalic of the same name; population estimated at 6,000. It is pleasantly situated on the sides and summit of a conical hill near the Murad Chaf, or eastern arm of the Euphrates, 75 m. s. e. of Erzeroum. The plain in which it stands is about 40 m. in length and 12 or 14 m. in breadth, and is well-watered. The climate is variable. It contains 100 villages, and produces grain, tobacco, and wine of good quality. The town presents a poor appearance. It is inhabited by Turks and Armenians, the latter, having the trade of the place, are wealthy, and pay an annual tribute of £2,000, from which the Turks are exempt. There are 7 mosques, 4 churches, and several large, well-built, bazaars. Coarse cotton cloth is manufactured here. The chief articles of export are tobacco and cattle. But a small quantity of European manufactures is imported.

**MOQUE GUA,** a t. of Peru, capital of a province of the same name, 26 m. n.w. of Tacna, on the great w. r. of the Cordilleras. In the province are many large vineyards, which produce great quantities of wine and brandy. Pop. 9,000.

**MOQUIS,** the name of a tribe of Indians living in n.w. Arizona, on the Little Colorado and San Juan rivers. They are known as far back as the middle of the 18th c., when they were visited by the Europeans, and received from them certain domestic animals, including sheep, the breed of which they continue to hold. Missionaries were sent among them by the Franciscans, but in the latter part of the 17th c. there was a general rising of the Moquis, when the missionaries were exterminated. An attempt in 1729, in the part of the viceroy of Mexico, to subdue this tribe, was unsuccessful; but 25 years later a new Franciscan mission had been effectual in making converts among them. Since that time they became peaceable, only resisting the attacks of the Apaches and Navajoes, who became their bitter foes, and have harassed them greatly. They are agricultural; are divided into 9 subdivisions, or families; and dwell in villages of houses built after the manner of the Indians of New Mexico. At the time when the United States government first took them in charge the Moquis were estimated to number 8,000; but in 1853 they were severely afflicted by an epidemic of smallpox, and their numbers much reduced; and, again, they suffered from famine in 1863. Their number in 1872 was reported at 1663. They are not temperate, and their women are noted for chastity.

MORA, a genus of trees of the natural order leguminosae, sub-order espalpinier, containing only one knows species, *M. excelsa,* discovered by sir R. Schomburgk, and described by him as the most majestic tree of Guiana. The timber is said to be equal to oak of the finest quality. It is already a considerable article of commerce, under the name of mora wood. It is darker than mahogany. It is valued for ship-building.

**MORA (Lat.) is a word often used in Scotch law to denote delay caused by negligence. In England and Ireland the corresponding word is laches (q.v.).**

**MORA, a co. in n.e. New Mexico, adjoining Texas; 5,000 sq.m.; pop. 70, 8,056—7,775 of American birth. The surface, especially in the w. portions, is mountainous, intersected in the w. by a ridge from the Rocky mountains. Most of the county is a wide, treeless plain. The Canadian river and Mora creek flow through it. The principal productions are Indian corn, wheat, oats, hay, and wool. There are manufactories of flour and wool. Co. seat, Mora.**

**MORACEAE,** a natural order of exogenous plants, or, according to many botanists, a sub-order of urticae (q.v.). The moraceae are trees or shrubs with rough leaves and sometimes with climbing stems; they have a milky juice; the flowers are very small; the fruits of many flowers are often inclosed in a succulent receptacle, or the calyx becoming fleshy, all the fruits of a head or spike become combined into one. There are about 200 known species, natives of temperate and tropical climates. Some are valuable for their fruit, some for the caoutchouc obtained from their milky juice, and dif-
ferent parts of others are applied to various uses. Among the species are figs, mulberries, Osage orange, fustic, and comtryerva.

MORABAD, a t. of British India, capital of a district of the same name, is situated on a slightly elevated ridge between the Ramganga and the Ganges, 90 m. c.n.e. of Delhi. There is a large jail, capable of holding 1800, for native convicts. West of the town, and separated from it by the jail, are the cantonments for the troops, agreeably situated amid luxuriant trees; the chief duty of the troops is to guard the convicts. Pop. (at census of N.W. Provinces, 1872) 62,417.

MORAIN. The masses of rock which, by atmospheric action, are separated from the mountains bounding the valleys along which glaciers flow, find a temporary resting-place on the surface of the ice, at the margin of the glacier, and are carried along with it, but so slowly that they form a continuous line along each margin. These lines of débris are called lateral moraines. When two glaciers unite, the two inner moraines unite also, and form one large trail in the middle of the trunk glacier, and this is called a median moraine. A large portion of these rocky fragments at length reaches the end of the glacier, and here the melting ice leaves it as a huge mound, which is known as a terminal moraine. See Glacier.

MORALES, Luis de, 1509-86; b. Spain; studied the works of the Spanish masters, and was called El Diciado, "the divine," from his preference for sacred subjects. His Saviors and Magdalenes are exact representations of suffering borne with meekness. His best work is the "St. Veronica" in the church of the Barefooted Trinitarians in Madrid.

MORALITIES. See Mysteries.

MORALS. See Ethics.

MORAN, Benjamin, b. Penn., 1820; at first a printer in Philadelphia. He made a tour of England, in foot, in 1850, publishing an account of it in 1853, under the title of The Footpath and the Highway. In 1854 he became private secretary to James Buchanan, then American minister to England. In 1855 he was appointed secretary of the American legation in London, where he remained till 1854, when he became minister to Portugal, which post he still retains (1881).

MORAN, Edward, b. Lancashire, Eng., 1829; removed with his parents while young to Philadelphia. He became a pupil there of James Hamilton, a well-known marine painter. His work early indicated much aptitude for this class of subjects, and his paintings were of a good order of merit from the first. He went to London in 1862, remained abroad long enough to profit by the study of the great marine painters of England and the continent, and returned to reside in New York in 1869. His works have found steady sale, and have frequently been the originals for engravings. Among them are "Outward Bound," "Lunch of the Life-Boat," "The Burning Yacht," "Minot Ledge Light," "The Coming Storm in New York Bay," "Solitude," and "Dream Life." Mr. Moran is careful in the finish of his pictures, and has confined his brush almost exclusively to marine subjects. He is an associate of the national academy of N. Y., where he now resides, and a member of the society of American artists.

MORAN, Peter, b. Lancashire, Eng., 1842; brought by his parents to Philadelphia, where he was educated, and then put with a lithographer to learn his art. He did not like it; and deserted it for the studios of his elder brothers, where he found his vocation in a field slightly different from theirs and yet allied. His taste led him to pastoral and quiet scenes in country life, and especially to animal painting, though he has not confined himself to still-life pictures. "Twilight," "The Return of the Herd," "The Thunderstorm," "Fog on a Sea-Shore," and "Settled Rain," are the names of a few of the paintings which have given him celebrity, and indicate his appreciation of the poetic aspects of still-life in nature. The "Return of the Herd" received a medal at the centennial exhibition.

MORAN, Thomas, b. in Lancashire, Eng., 1837. When seven years old his family came to Philadelphia, where Thomas was educated in the city schools, and then apprenticed to a printer, which engaged an operator. During this apprenticeship he devoted all his spare time by day to painting in water colors and the study of painting, and his evenings to drawing. His success was immediate; his water-color paintings sold quickly at good prices. When master of water-colors, and studying from nature, he perceived the greater range of oil painting, and at 23 years of age turned his attention to that department. When 25 he visited England. In 1866 he again went to Europe, visited England, France, and Italy, and remained several years for work. He returned in 1871 and joined prof. Hayden's party of exploration to the head waters of the Yellowstone river, where he made the sketches from which he produced the picture of the "Grand Cañon of the Yellowstone," purchased by congress, and now filling a panel in the capitol at Washington. The following year he visited the Yosemite and the Sierras of California and Nevada. In 1873 he joined the U. S. exploring expedition, conducted by maj. J. W. Powell, which surveyed the wonderful canyons of the Colorado river in Colorado and Utah, and on his return completed a picture of "The Cañon of the Colorado," which was purchased by congress as a companion to the Yellowstone picture. The following year he visited the mountain of the Holy Cross in Colorado, and on his return
to New York, where he has made his residence, he finished a picture of that mountain, which ranks as one of his grand works. These are a few of Mr. Moran's large works. Of smaller pieces he has been a prolific worker in every department of landscape art. Among these are: "The Last Arrow," "The Ripening of the Leaf," "Dreamland," "The Groves where God's First Temples were," "The Pictured Rocks of Lake Superior," "The Counemagh in Autumn," "The First Ship," "The Flight into Egypt," "The Removal of Cain," "The Children of the Mountain," "The Track of the Storm," "Ponce de Leon in Florida," "New York from Communipaw," and "After a Thaw." It is to Mr. Moran's skilled pencil that the world is indebted for the superb illustrations on wood that adorn the reports of both Hayden's and Powell's explorations and the most spirited recent engravings of Rocky mountain scenery. "The Wonders of the Yellowstone," which have been illustrated in chromo by L. Prang & Co., are from his water-color sketches. Mr. Moran's style is marked neither by over-care nor by carelessness of finish. In the "After a Thaw," a locomotive on the flanks of New Jersey, seen through a spring mist, becomes a picture of poetic beauty.

MORANO, a city of southern Italy, in the province of Cosenza, built on a hill in a wild and rugged neighborhood, 35 m. n.n.w. of Cosenza. Pop. 8,350. It has good manufactures of silk, cotton, and woolen fabrics.

MORAT (Lat. Moratum, Ger. Moraten), a t. of, '71, 2,328 inhabitants, in the canton of Frudiburg, Switzerland, on the lake of Morat, about 12 m. from Bern, famous for the victory of the Swiss and their allies over Charles the bold, duke of Burgundy, June 22, 1476. The duke, exasperated by his defeat at Grandson in March, appeared before the gates of Morat with 40,000 men. The Swiss were aided by Strasburg, Basel, Colmar, and other Rhenish cities, and by duke René of Lorraine, whom the duke of Burgundy had driven from his possessions; but the superiority of numbers was greatly on the side of the duke of Burgundy. The assault of the Swiss, however, was very impetuous, and their victory complete; the duke's camp fell into their hands, and he himself only escaped by the swiftness of his horse.

MORATA, OLYMPIA FELIXA, 1526-55; b. Ferrara; was carefully educated, and became an accomplished classical scholar. She is said to have given lectures on classical subjects at Ferrara in her 16th year. She afterward married a German physician named Andreas Grunthler, and was converted to Protestantism. In 1555 margrave Albert of Brandenburg pillaged Schweinfurt, where she was living, and she lost her library, and was forced to take refuge in Hammelburg. Grunthler was presently appointed a professor at Heidelberg, where she went to reside. She published many poems, written in Greek or Latin.

MORATIN, LEANDRO FERNandez DE, the most eminent comic poet that Spain has produced in recent times, was b. at Madrid Mar. 10, 1760. His father, Nicolas Fernandez de Moratin, was also a poet of some eminence, but having found that literary labors afforded a precarious support, he wished his son to learn the trade of a jeweler, by which, after his father's death, he, in fact, for some time supported himself and his mother. In 1780 appeared his first and best comedy, El Vago e la Mar; Moratin was followed in this genre by Cano, Corts, El Basore, La Magistrada, and Elas de los Ninos. Prince Godoy conferred several ecclesiastical benefices upon him, though the inquisition set its evil eye upon the poet. Joseph Bonaparte made him chief royal librarian; and after 1814 he took refuge in Paris. His last work was the Origenes del Teatro Espanol. He died in Paris June 21, 1828.

MORATIN, NICOLAS FERNandez DE, 1737-80; b. Madrid; a friend of Montiano, the restorer of classical tragedy in Spain. Following the example of Montiano and Lazarus, he attempted to reform the drama, and to purge it of romanticism. In 1762 he published three discourses against the older drama, under the title of Discursos al Teatro Espanol. In these discourses he bitterly attacked the old-characteristic Autos Sacramentales, which were suppressed by the government in 1765. In the same year that the discourses appeared he wrote a comedy, La Pentinencia, in the French manner; neither this, nor his tragedy Lucrecia, was represented, on account of the strong prejudice then prevailing in Spain against French innovations. In 1770 he succeeded in having his tragedy of Hormesinda produced on the stage, and it was favorably received. He wrote but one more tragedy, Germán el Buene, which was never performed. Before this, he had turned his talents in the direction in which he was to do his best work, and had published, in 1764, a collection of verses called El Pelo. This was followed the next year by Diana, a didactic poem on the chase. His most important work, a historical epic called La Vida de Cervantes, appeared the same year. He was at first professor of music, but was afterward made professor of poetry in the imperial college at Madrid. He formed a club, which met at Madrid and considered the productions of contemporary literature. He was on intimate terms with the chief scholars and authors of Spain.—Cahahalo, Ayala, Montiano, the botanist Ortega, and Pazardo, the translator of Buffon. His posthumous works were published by his son Leandro, in 1831.

MORAVA, the chief river of Servia. It is formed by the union of two head streams—the eastern or Bulgarian Morava, which rises in the mountains to the s. of the new
southern frontier of Servia; and the western or Servian Moravia, which rises on the western frontier. The united stream flows northward to the Danube, and has a total length of about 180 miles.

**MO RAVA**, or, more properly, March (called by the ancients *Marches*), a river of Austria, has its origin on the southern slope of the Schneeberg, on the borders of Prussian Silesia, 3,882 ft. above sea-level. It is the chief river of Moravia, to which it gives its name, and flows s. through that crown-land, receiving on the right the Thaya, and falling into the Danube, 8 m. above Presburg. In its lower course, it forms the boundary between Lower Austria and Hungary. Its course is 184 m. in length, and it is navigable from Göding, upward of 60 m. from its mouth.

**MORAVIA** (Ger. *Mähren*), a crown-land of the Austrian empire, situated in 48° 40' to 50° n. lat., and 15° 5' to 18° 45' e. long. It is bounded n. by Prussian and Austrian Silesia, e. by Hungary and Galicia, s. by the duchy of Austria, and w. by Bohemia. The superficial area is about 8,489 sq. m.; and the pop. in 1870 was 2,917,974.

Moravia is inclosed and traversed on all sides by mountains, being separated from Silesia by the range of the Sudetes; from Bohemia, by the Moravian chain; and from Hungary, by the Carpathian mountains; while branches of these various chains intersect the whole country except in the s., where the land consists of extensive plains, lying about 800 ft. above the level of the sea. The numerous small rivers of the interior follow a s.e. direction, and fall into the March or Morava, from which the country derives its name, and then flow together with the latter into the Danube. The Oder, and its affluents the Elsa and Oppa, rise among the mountains on the n.e., from whence their course is soon turned directly away from the Moravian territory. There are few extensive lakes, but numerous ponds and small streams, which abound in fish. The more elevated parts of the country are not fertile, and the climate is severe; but in the mountain valleys and on the southern plains the soil is remarkably rich, and the temperature more genial than in other European countries lying in the same parallel. Moravia, which ranks as one of the richest of the Austrian dominions, has half of its area in arable land. It yields fine crops of grain, and among the other natural products grown for exportation we may instance hops, mustard, potatoes, clover-seed, beet-root; and in the s., maize, grapes, chestnuts, and many other of the less handy fruits and vegetables. The breeding of cattle and sheep, and the making of cheese from sheep's milk, constitute an important branch of industry; in the southern districts of the Hana (a plain famous for its fertility), horses are bred for exportation. Geese and fowls are reared in large numbers for the sake of their feathers, and the keeping of bees is conducted with great success. The mineral products include iron, alum, salt-petre, coal, graphite, weatstones, sulphur, vitriol, pipe-clay, marble, and topazes, garnets, and other precious stones.

**Industry, etc.**—The principal branches of industry are the manufacture of linen and thread, which now enjoy a European reputation, and those for cotton goods at Sternberg. Moravia has long been noted for the excellence of its cloths, flannels, and other woollen fabrics, and for its leather goods. The minerals of Moravia, especially coal and iron, are important, and are extensively wrought. Beet-sugar is largely manufactured. Brunn (q.v.), the capital, is the chiefemporium for the manufacturing trade, and Olmutz (q.v.) the principal cattle mart.

The educational wants of the province are provided for by 12 gymnasias and about 1000 schools. The former university at Olmutz is now represented by a theological faculty, and by a large technical institute. The majority of the people belong to the church of Rome. There are about 50,000 Protestants and 40,000 Jews.

In regard to nationality, the population may be divided as follows: About 500,000 Germans, nearly a million and a half of Slavs, and 50,000 belonging to other races (including Jews). The Slavs of Moravia are mostly Czechs, with Poles and a few Croats. The Czechs are inferior in all respects to their brethren in Bohemia. The Moravian Poles, although inferior to the Germans as regards industry and cultivation, are a physically well developed, courageous, and enterprising people.

**History.**—Moravia was anciently occupied by the Quadi, who, on their migration in the 5th c., to Gaul and Hispania, were replaced first by the Rugii, next by the Herniand Longobardi, and finally by a colony of Slavonians, who, on their settlement in the country, took the name of Moravians, from the river Morava. Charlemagne, who brought the people under nominal subjection after they had spread themselves over a territory greater than the present Moravia, constrained their king, Samoslav, to receive baptism; but Christianity was first formally established in the middle of the 9th c. by Cyril, who must be regarded as the true apostle of the land. Moravia was made tributary to the German empire before the close of the century; but in 1029 it was incorporated with Bohemia, after having for a time been a prey to the incursive attacks of its Slavonic and Teutonic neighbors. At the close of the 13th c. Moravia was erected into a margraviate, and declared a fief of Bohemia, to be held from the crown by the younger branches of the royal house. On the death of Louis II, at the battle of Marchfeld, 1006, Moravia, with all the other Bohemian lands, fell to the crown in accordance with a pre-existing compact of succession between the royal houses. Since then it has shared the fortunes of the empire, and in 1849 it was formally separated from Bohemia, and declared a distinct province and crown-land.
The Moravians (called also United Brethren, Moravian Brethren, or Bohemian Brethren), a religious community, tracing its origin to the followers of John Huss, who were expelled by persecution from Bohemia and Moravia in the beginning of the 18th c., and of whom a small company, consisting at first of only 10 persons, received permission for settlement at Zinzendorf (q.v.), in 1722, to settle on his estate of Berthelsdorf, in Saxony.

To this settlement they gave the name of Herrnhut, whence they are commonly known in Germany as Hermutters. It rapidly increased, not only by the accession of additional Bohemian and Moravian refugees, but also of other Christians, who were attracted by the faith and piety which remarkably prevailed in it. Zinzendorf joined the little brotherhood, devoted his whole estate to the propagation of Christianity, and undertook the work of the ministry. The doctrines which they received being those of the Augsburg confession, it was proposed that they should unite themselves with the Lutheran church; but a difference of opinion existing on this point, it was decided, as difficult questions still sometimes are among the Moravian, by an appeal to the lot; and the result was, that the United Brethren, or Undas Brethian, as they termed themselves, remained a distinct community, and adopted an organization of their own. Till Zinzendorf's death in 1750, he was really their leader, and was recognized by them as ordinarius. After his death, their organization was completed by synods held in 1764 and 1766.

The Moravians are recognized by the state in Germany, as Protestants attached to the Augsburg confession. They have no symbolic books of their own, although they drew up a simple and brief confession of their faith in 1727, and a brief statement of principles was emitted by a synod held in 1775.

The Moravians profess to be connected with the Bohemian or Moravian Brethren of former times by a regular succession of bishops. The bishops, however, exercise no episcopal authority, and their chief peculiar function is that of ordination, of which they alone have the power. Every congregation is governed by a conference of elders. The elders are bound to visit each family once in three months, and to report concerning the maintenance of family worship and the conduct of the brethren. It is also their duty to visit the sick, and to aid the poor with money contributed by the other brethren. The whole church is governed by synods, which meet—always in Germany—at intervals of every three years, and are composed not only of bishops, but also of other members of the brotherhood. Between oe one synod and another, all affairs are managed by a conference of elders appointed by the synod.

Moravians are to some extent scattered amongst the general population of the countries in which they dwell, as Britain and America; but they prefer, where it is possible, to live in colonies, or separate societies, and in these they carry out some very peculiar parts of their organization, particularly a division into choirs of children, youths, maidens, unmarried brethren, unmarried sisters, widowers, and widows, each having a separate leader or pastor. Unmarried brethren, unmarried sisters, widowers, and widows, reside in separate houses; married couples in houses of their own. Colonies of Moravians exist in England, America, Holland and other countries, but are most numerous in Germany. The most important colonies, however, are perhaps those in the mission-fields.

The Brethren early entered on missionary work, and all the prosperity of their church has been evidently connected with their earnest prosecution of it. Their first mission was made in 1733, in the Morendi island, the Moravian brethren having been moved thereto expressing their resolution to become slaves, if necessary, in order to carry out their purpose. A mission to Greenland, which has been eminently successful, and may be said to have made Greenland a Christian country, was commenced in 1733. They have also interesting missions in Labrador and at the Cape of Good Hope, and in other heathen countries. The Moravians have at their mission-stations about 70,000 converts from heathenism. One of the most interesting of their stations is at Saraupta, in the government of Saratov, in Russia, by which they are connected with the Tartars and Kazhucks. In all their settlements, the education of the young receives the utmost attention.

The religious services of the Moravians are conducted with great simplicity. They meet for worship daily, in the evening, the service being much like that of a prayer-meeting amongst other Christians. They use a litany on the Lord's day, but extemporary prayer is frequent. They admit the use of instrumental music. They maintain the custom of washing the feet, both in choirs and in congregations, before the communion. They meet on the last day of the year, to bring in the New Year with prayer and other exercises of religion. On Easter morning they assemble in the burying-ground to celebrate the resurrection of Christ, and to express their confidence concerning the brethren who have died during the preceding year. The death of a member of the brotherhood is made known in the chief settlements by sound of trumpets, as if for victory; the melody indicating the particular choir to which the deceased belonged. In some of the settlements peculiar dresses are worn by the members of particular choirs.

In 1875 there were in Europe 98 congregations of Moravians, with 9,121 communicants; and in America, 75 congregations, with 8,315 communicants. Seventeen bishops were living in 1875, of whom 6 were in the United States. There were 92 mission stations, with 333 missionaries, and above 1000 native assistants, having the care of 58,553 communicants.
MORAVIANS (Quot), so named because Moravia was at one time their principal seat, existed as a body of Christians—1. From the time of John Huss, about the middle of the 15th c., when they were more commonly called the Bohemian brethren. In 1456 some members of a parish in Prague, wishing for their own personal welfare to escape from the corruption of the national church, withdrew, by permission obtained from the regent of Bohemia through the intervention of their priest, to an estate called Lititz, on the eastern frontier, that had been desolated by war and was thinly inhabited. Their object was not to form a new sect, but to continue the reformation which Huss had commenced, limiting their efforts, however, to the society formed among themselves within the national church, the members of which were pledged to adhere to the Bible as the only rule of faith and practice, to maintain a scriptural discipline, and, in administering the Lord's supper to employ the exact words of Christ with- out adding or taking away any explanation of them. In 1457 they adopted a statement of their principles and com- mitted it to the care and administration of 28 elders. They assumed at first the title of Brethren and Sisters of the Law of Christ, afterward shortening it to The Brethren. Still later the well-known Latin title Unitas Fratrum, Unity of the Brethren, came into use, and is now their official designation. Gregory the patriarch presided over them, and some of the priests of the national church ministered to them. Their influence rapidly extended through Bohemia and Moravia. Their elders made their principles known, and received many earnest inquirers into fellowship. In 1461 they suffered persecution, notwithstanding which they continued to grow. In 1464 three of the elders were imprisoned with a special supervision of their affairs, and received written instructions for their guidance. "We are, above all, agreed to continue, through grace, sound in the faith of our Lord Jesus Christ; to be established in the righteousness which is of God, to maintain the bond of love among each other, and to have our hope in the living God. We will show this both in word and deed, assist each other in the spirit of love, live honestly, study to be meek, quiet, humble, sober, and patient, and thus to testify to others that we have in truth a sound faith, genuine love, and a sure and certain hope." To these principles they have ever remained true. They have manifested their faith by their works, and have diligently maintained scriptural discipline. Their confessions of faith have always magnified the importance of practical Christianity, and in their churches they have required evidence of personal piety, not the mere assent to a creed. In separating from the national church and ordaining a ministry for themselves they sought divine guidance by patient waiting, fasting, and prayer, and laid all of the cries of the lot. In 1462 three men were appointed, again by lot, to the ministry, who were ordained first by their own presbyters, in accordance with what they believed had been the practice in apostolic times, and secondly as bishops by Waldensian bishops, that they might also conform to the custom of the churches in the age after the apostles, besides gaining thus a ministry that would be universally acknowledged. After this their numbers increased rapidly in all parts of Bohemia and Moravia. Differences of opinion concerning discipline caused them internal trouble, 1480-94; and grievous persecutions, 1483 and 1508, came upon them from without. The national church united with the Roman Catholics to exterminate them by means of imprisonment, spoliation, torture, and death. But again "the blood of the martyrs was the seed of the church." The persecutions came to an end, and the brethren renewed their numbers and their strength. When the reformation in the 16th c. began, they were in a good condition having churches in 400 parishes with at least 200,000 members, among whom were included some of high rank and influence. They used their own hymn-book, catechism, confession of faith, and printing-presses for multiplying Bibles and evangelical books. They were therefore truly, as they have been called, "reformers before the reformation." Yet, in full accordance with their character, they hailed the new movement with joy, entering into conference first with Luther, and afterward with the Swiss reformers. This fellowship was helpful to all parties. The doctrinal system of the Moravians was improved, and discipline and union among the reformers were promoted. The brethren established themselves in Poland, 1549, during the persecution inflicted on them by Ferdinand I. Large numbers of them, banished from Bohemia, removed to East Prussia, and thence one of them, George Israel, went to Poland, where he preached with great success. In 1557 the Polish churches were received into the union. Rudolph II., 1609, in compliance with the demands of his barons, granted a charter which secured religious liberty in Bohemia and Moravia. An evangelical consistory was formed at Prague in which the brethren as a legally acknowledged church were represented by one of their bishops. In 1619 the Bohemian revolution caused by the accession of Ferdinand II. changed the face of religious affairs, and developed into the Thirty-years war, during which Bohemia and Moravia were brought into subjection to Roman Catholic power. In 1621 the king, having put to death many Protestant nobles, began what was called the anti-reformation. Commissioners, aided by Jesuits and soldiers, went through the country to force the people back to the Roman church. Many laid down their lives; 30,000 families left the country, and the rest of the people were driven into an outward subjection. The Moravians, thus banished from their homes, re-appeared in other lands. About 100 new parishes were organized in Prussia, Hungary, and Poland. They had cherished the hope of returning to their own
countries at the termination of the war. But at the peace of Westphalia these countries were not restored to the enjoyment of religious liberty. Eight years after that peace, their settlement in Poland was broken up by war between that country and Sweden. The members of their council were scattered, and their parishes were transferred to the Reformed church. For more than half a century their visible organization ceased to exist; only its hidden seed in Bohemia and Moravia remained. But their bishop, Amos Comenius, as if prophetically assured of their future re-appearance, published a new edition of their history, doctrines, and discipline; commanded them to the care of the English church, and formed plans for preserving their episcopacy by consecrating clergymen of the Reformed church, with which they had been united in Poland.

II. The renewed Moravian Church.—In 1722 some of the “hidden seed” was revealed by the escape of several families from Moravia under the lead of Christian David. By invitation of Count Zinzendorf they settled on his domain of Herrnhut, in Saxony, and within seven years about 300 others having joined them from Bohemia and Moravia, they built a town which they named Herrnhut, “the watch of the Lord,” and which was soon strengthened by the coming of religious men from other parts of Germany. Within this colony the Moravian church was formally renewed by the introduction of the ancient discipline which Comenius had reprinted, and in the consecration of a new bishop by the hands of the two surviving bishops among the clergymen of the Reformed church. While the ancient church thus entered on a new life, as many persons of various views united with it from different parts of Germany, and as Count Zinzendorf also had some peculiar opinions, the new development differed somewhat from the old. Count Zinzendorf having become the leading bishop, strove, in rebuilding the church, to interfere as little as possible with the national church, in which he had been born. In carrying out his views he established on the continent of Europe, in Great Britain, and America, strictly Moravian settlements, where the vanity and irreligion of the world were to be shut out, a high standard of spiritual life was to be maintained, and only brethren to hold real estate. These Moravian settlements were designed to be as heaven throughout Christendom. Among them a merely nominal profession of Christianity was not to be known; but all the inhabitants were to be sincere followers of Christ. This ideal was for a long time kept steadily in view, and with very great success. Besides these exclusive settlements they had in Great Britain and America some churches of a more general character. For a time fanaticism and extravagance threatened great injury to their settlements and churches in Europe; but the timely efforts of Zinzendorf and his helpers were successful in checking the evil. Their salutary influence extended far beyond their own bounds. They contributed greatly to improve John Wesley, it is supposed, by the Schwenky, for the love to Christ which gave character to his whole life; afforded places of refuge for true Christianity during the prevalence of German rationalism; educated in their schools large numbers of young persons belonging to other denominations; started a great home missionary work; and engaged with pre-eminent zeal in establishing missions in heathen lands. There are still 15 exclusively Moravian settlements on the continent of Europe, and four in Great Britain. In these the members are divided into seven classes called choirs: the married, the widowed, the unmarried men, the unmarried women, the boys, the girls, and little children. In each village there is a Brethren’s house for the unmarried men, who live together and carry on trades; a Sisters’ house, where the unmarried women have their homes and are supplied with work suited to them; and a Widows’ home, where all of that class are provided, at moderate cost, with all things needed for their comfort, and where the poorest can live respectfully. The spiritual affairs are under the superintendence of the Elders’ conference, while financial and municipal matters are managed by the board of overseers. Until lately real estate could be held only by Moravians, but changes in this rule are in progress which will probably result in the entire abolition of the exclusive system.

III. The Moravian Church in America.—Moravian emigrants went to Georgia in 1733; but five years afterward, when troubles arose between that colony and Spain, they removed to Pennsylvania, where they built the towns of Bethlehem and Nazareth. These and some smaller settlements adopted the exclusive plan and even communism in labor. “The lands were the property of the church, and the farms and various departments of mechanical industry were stocked by it and worked for its benefit. In return the church provided the inhabitants with all the necessaries of life. Those however who had means of their own retained them. There was no common treasury.” This system, which was called the “Economy,” existed for 20 years, during which time it produced great results. Each member of it was pledged to devote his time and powers in whatever direction they could be best applied for the spread of the gospel. By this means there went forth a succession of missionaries through the colonies and among the Indians, preaching salvation by Christ, while the work at home of farmers and mechanics provided for their support. Though the Economy was of short duration, the exclusive foreign policy was continued 80 years. But toward the middle of the present century it was gradually modified, and has now been set aside. The Unitas Fratrum is divided into three provinces, the German, British, and American, which are independent in local affairs, but form one organization for the control of doctrine, discipline, ritual, and foreign missions. The provincial synods meet at fixed times, and pro-
vide for all matters of administration among themselves. At intervals of ten or twelve years the general synod of the whole body is held at Herrnhut in Saxony. It consists of nine delegates from each province, of delegates from the foreign missions, and of certain ex officio members. It elects a board of twelve bishops to oversee the whole church in general matters, and to superintend the foreign missions. At the last meeting of the general synod in 1879 the number of members reported from the various provinces was over 30,000, and of missionaries and their children 400. In all the provinces they have about 50 boarding-schools designed for young people not connected with the denomination, and containing annually about 2,500 pupils. The work of foreign missions was commenced almost simultaneously with the building of Herrnhut, and since that time about 2,500 missionaries have been sent out and sustained by the labor of the members remaining at home. At the present time they have missions in 17 provinces distributed over the world.

MORA'WA, river in Austria. See March.

MORA WOOD, a dark timber from a Guiana tree, the dimorphandra mora, or moral excesa of the order leguminosae. It is brought to Europe for shipbuilding purposes.

MORA, EARL OF. See Murray, earl.

MORAY Firth, and indentation of the German ocean, on the n.e. coast of Scotland. Its n.w. shore is formed by the counties of Ross and Cromarty, and extends from Kessock ferry, opposite Inverness, to Tarbet Ness. Its s.e. shore extends from Inverness to Burghead, in Elginshire. The entrance of the firth between Burghead and Tarbet Ness is 16 m. in width, and from its entrance to Inverness it is 31 m. in extent. The firth is continued westward from Inverness by a branch called Badly basin.

MORAYSHIRE. See Elginshire.

MORAZAN, Francisco, 1790-1842; b. in Honduras, his father being of Corsican descent. At an early age he began to be active in the troubled politics of Central America, and when but 25 years old was made secretary-general of Honduras; and soon after, having shown himself both a good soldier and a keen statesman, he was elected governor of the state. At that time the liberal party was in power, but constant insurrections were incited by the reactionary factions. These factions Morazan met with firm military measures, and in 1829 drove them out from the city of Guatemala, a service rewarded by the congress with the title of "saviour of the republic." From this time until 1832 he was commander-in-chief of the forces and intrusted with extraordinary powers. He used his authority in ridding the country of the curse of monasticism, abolished convents and tithes, and had the boldness to expel the archbishop of the diocese and other church dignitaries. In 1832 he repelled an invasion from Mexico headed by Aree, a former president, and consented to accept the presidency, which up to that time he had refused. But he had underrated the power of the church; the prevalence of the cholera gave the priests a pretense to influence the minds of their most ignorant devotees, mostly Indians, with preposterous tales of poisoning and the "vengeance of heaven." A general rising took place, Morazan was overpowered, and, in 1840, compelled to flee to Chili. In 1842 he went to Central America, and was quietly received by the government. Still adhering to the idea of federation of the states of Central America he soon lost his popularity; again a sudden insurrection was incited and Morazan fell a victim, being court-marshaled and shot on Sept. 15, the anniversary of the federation in 1823 of the five independent states.

MORBID APPETITES may consist of a desire which is, in character, natural and necessary to the animal economy, but becomes unhealthy when excessive and irresistible. Of this, the hunger which attends marasmus, and the thirst which attends diabetes, may be cited as illustrations. They may consist, further, in a craving for articles or objects not in reality deleterious or detrimental, but which do not constitute the ordinary gratification of the appetite, such as the desire for chalk and lime experienced by chlorotic and hysterical women. They may, thirdly, consist in the longings, often complicated with delusions, felt by pregnant women and others, which are injurious, repugnant to nature, and revolting. Georget gives an instance where a wife coveted the shoulder of her husband, killed him in order to obtain the morsel, and salted the body in order to prolong the hideous carbuncle; and in such a case the gross longing may be said to constitute the disease; but there are others in which it is one of many symptoms demonstrating the degradation of the mind under general disease, as when the insane devour garbage, excrements, or swallow grass, hair, stones.—Georget, Dict. de Médecine; Feuchtersleben, p. 276.

MORBIHAN, a maritime department in the n.w. of France, formed out of ancient Bretagne. Area, 2,615 sq.m.; pop. 76, 506,573. The coast is much indented, and has a multitude of bays, roadsteads, harbors, and islands. The largest island is Belle isle (q.v.). The department has a somewhat hilly appearance, but towards the sea the land stretches out in rich plains, interrupted, however, by great tracts of heath and marsh. The climate is mild but moist. The soil is not well cultivated, but yields sufficient grain for home consumption. The heaths afford fine pastureage, and support great herds of horned cattle, sheep, and horses. The rearing of bees is a source of very considerable revenue; as also are the river and coast fisheries. The trade in sardines is particularly extensive. The want of wood is so great that the peasants are obliged to
burned extensively. The chief mineral is iron, but there are almost no manufactures. Morbihan is divided into the four arrondissements of Vannes, L'Orient, Plœmeil, and Pontivy. The chief town is Vannes (q.v.), but the most populous is L'Orient (q.v.).

MORDANTS. See Dyestuff.

MORDAUNT, CHARLES, Earl of Peterborough, military and naval commander, and one of the most brilliant Englishmen of his time, was the son of John, lord Mordaunt, and was born in 1555, son of the earl. He served as a boy in the navy, and then entered the army. He took part against James I., and was made earl of Monmouth by William III., succeeding afterwards to the earldom of Peterborough, as heir to his uncle. During the war of the Spanish succession the English government determined to send an expedition to Spain. It was placed under the command of Mordaunt, and in June, 1705, he arrived in Lisbon with 5,000 Dutch and English soldiers. After taking on board the archduke Charles of Austria, who claimed the Spanish crown, the armament proceeded to Valencia. Here Mordaunt, with characteristic daring, conceived the idea of making a dash at Madrid, and finishing the war at one blow. He was overruled by the archduke and the prince of Hesse, and compelled to besiege Barcelona, which was defended on one side by the sea, and on the other by the strong fortifications of Monjuich. By a coup de main he made himself master of Monjuich. Barcelona fell, and Mordaunt, with a handful of men, entered one of the strongest cities of Europe. He pushed his successes into the interior. Several towns submitted. He marched to Valencia in the depth of winter, and at the head of 12,000 men defeated a Spanish army of 34,000. He sent a large army into Catalonia, and a French fleet appeared off Barcelona. Mordaunt harassed the enemy's army, and putting himself on board the English squadron, directed a movement which, had it been executed a few hours earlier, would have resulted in the capture of the whole French fleet. The Frenchmen put to sea, and Barcelona was saved. Mordaunt again wished to march towards Madrid, but his plan for gaining possession of the capital was once more rejected by Charles. He accordingly left the army in a fit of pique, and went to Italy. In 1707 he returned to Valencia as a volunteer, and gave excellent advice, which was not followed. He was recalled to England, and from that moment the tide of fortune ran strongly against the Austrian cause. Few generals have done so much with means so small, or displayed equal originality or boldness. His fertility and activity of mind were admirably seconded by a most intrinsically strong spirit. His splendid talents, on the other hand, were disfigured by vanity, and a morbid craving for novelty and excitement. He loved to fly round Europe, and was said to have seen more kings and postilions than any other man of his day. On his return he made common cause with the Tories, to spite the duke of Marlborough, and received the garter and other dignities for his services. On the accession of George I. he was appointed commander-in-chief of the naval forces of Great Britain; he died at Lisbon, Oct. 25, 1735. His witty yet affectionate letters to Pope, Swift, Prior, etc., give a fine insight into his private character. See Eliot Warburton's Memoir of Charles Mordaunt, Earl of Peterborough and Monmouth, with Selections from his Correspondence, 2 vols. (1853). His character has been sketched by Horace Walpole, in his Catalogue of Royal and Noble Authors, and with still greater force and picturesqueness by Macaulay.

MORDCAI, ALFRED, b. N. C., 1800; graduated at West Point in 1823, and remained there the two following years as professor of philosophy, and engineering. In 1855 he was sent by the government to the Crimea as a member of the military commission, and his report was published by congress in 1860. Since 1862 he has been assistant engineer of the Mexican and Pacific railroad. He is the author of several technical works, the chief of which is an Ordinance Manual.

MORDVINS, a people in c. Russia, between the Oka and Volga rivers. They belong to the Volga division of the Finns. Their number is estimated at 400,000. A grammar of their language was published by Ablhquis at St. Petersburg, 1871.

MORE, HENRY, D.D., 1614-87; b. Grantham, Lincolnshire, Eng.; studied at Eton, where beside his regular studies he spent much time in reading the philosophical works of Aristotle and Julius Scaliger; entered Christ college, Cambridge, at the age of 17, and graduated in 1653. During all his college course he devoted himself with great zeal to philosophy, saying to some one, "I immersed myself over head and ears in the study of philosophy, promising a most wonderful happiness to myself in it." He found no rest to his mind in any system, but became more and more perplexed and skeptical, until he came to the writings of Plato and the Platonie writers, and "discovered the long-looking for treasure in the dreamy pages of Marsilius Ficinus, Plotinus and Trismigistus." In 1639 he took the degree of master of arts, and became tutor to several persons of distinction. He declined many important offers in the church, preferring a quiet life at Cambridge and the study of philosophy even to the honors of a bishopric at 1500 a year. He resigned the rectory of Ingoldsby in 1642, declined the mastership of his own college in 1654, and though he accepted a prebend in the church of Gloucester in 1675, he soon resigned it. In 1649 he published Psychomachia or the First Part of the Song of the Soul, containing a Christiano-Platonical display of life. This was reprinted in 1647, and with some additional pieces under the title of the Philosophical Poems. His next work was Conjectura Cabalistica, and the Philosophiae Tenentum Censura, at the request of Lady Conway,
a noted disciple of William Penn. He secured her friendship, and received from her a legacy of £400, which he devoted to private charity. In 1671 he published *Enchiridion Metaphysicum*, in which he inveighed against Cartesianism. His other principal works are *Enchiridion Ethicum Metaphysicum*; *The Mystery of Intuïtivity. A Key to the Revelation*; *An Apology for Descartes; The Immortality of the Soul; Enthusiastic Triumphs; The Mystery of Godliness*, which for 29 years had a great sale. £200 were left by an admirer of his works to have some of More's pieces translated into Latin, which led the author to publish all his works in Latin in 3 folio vols. in 1679. His last work *More's Monast.* he did not live to finish. The greater number of his works appeared in English under the title of *A Collection of several Philosophical Writings*, folio, *The Life of the Learned and Pious Dr. Henry More was written by the Rev. Richard Ward. Though a mystical philosopher, he was a man of great intellectual power, profound learning, and rare excellence of character. He was one of the first fellows of the royal society, and was a correspondent of Descartes.*

MORE, HANNAH, the daughter of a village schoolmaster, near Bristol, was b. in 1745. She wrote verse at an early age; and in 1773, she published a pastoral drama entitled *The Search after Happiness*; and the year after, her tragedy of *Regulus.* Under the idea that she was possessed of dramatic talent, she was introduced to Garrick, and through him became acquainted with Dr. Johnson, Burke, and Sir Joshua Reynolds. Deeply impressed with the importance of religion, she gradually resigned her ambition to shine as a writer for the stage, and after the publication of her *Sacred Dramas*, she retired to the country, and busied herself with the composition of works of a more serious and practical cast, the best remembered of which are, *Cries in Search of a Wife*, and *The Shepherd of Salisbury Plain.* She died at Clifton, on Sept. 3, 1833. Her *Memoirs and Correspondence* were published in the following year, in 4 volumes.

MORE, Sir Thomas, lord chancellor, and one of England's worthiest sons, was b. in Milk street, London, in 1478, son of Sir John More, justice of the queen's bench. He was educated at St. Anthony's school, Threadneedle street; and in his fifteenth year was placed in the house of cardinal mortal, archbishop of Canterbury, who used to say of him: "This child here waiting at the table, whosoever shall live to see it, will prove a marveluous man." Dean Colet, too, was wont to say: "There was but one wit in England, and that was young Thomas More." In 1497 More went to Oxford, where he made the friendship of Erasmus. He then applied himself to the law, and studied first at New Inn, and afterwards at Lincoln's Inn. He was appointed reader at Furnival's Inn, where he lectured for three years. At the accession of Henry VIII., his professional practice was considerable, and he also held the office of judge of the sheriff's court in the city—his income from these sources being equivalent to £4,000 or £5,000 of our present money. He went on several missions abroad for the king, and in 1516 was made a privy-councilor. His public life now began. He became so great a favorite with Henry VIII., that, in the words of Erasmus, "the king would scarcely ever suffer the philosopher to quit him." Henry visited him uninvited at Chelsea, and walked with him by the arm through the streets of London. He held, says Erasmus, "a nearer insight into Henry's character, for being congratulated on the king's favor by his son-in-law, Roper, he replied: "If my head would win him a castle in France, when there was war between us, it should not fail to go." More is the first person in British history distinguished by the faculty of public speaking, and remarkable for the successful employment of it in parliament against a lavish grant of money to the crown. Being elected speaker of the house of commons in 1523, he vindicated the ancient liberties and privileges of the house against cardinal Wolsey, who rather feared than liked him. In 1529, when the prosecution was opened against Wolsey, the king delivered the great seal to More at Greenwich, constituting him lord chancellor, a dignity that had generally been held by ecclesiastics, and had never yet been filled by a common lawyer. When he was seated in his court of chancery, his father, Sir John More, who was nearly ninety, was the eldest judge of the King's bench. It was a beautiful spectacle to "see the son ask the blessing of the father every day upon his knees, before he sat upon his own seat." Unlike the haughty Wolsey, whom no suitor would approach without offerings, More sat daily in an open hall, that he might receive in person the petitions of the poor. He dispatched the causes so speedily and diligently, that on asking for the next, he was told that none remained. Henry in vain endeavored to obtain More's authority for his divorce with Catharine of Aragon, and his marriage with Anne Boleyn, upon which he had set his heart. As soon as the progress of the marriage was so far advanced that the active cooperation of a chancellor was required, More obtained leave to resign the great seal. When the king "by no gentleness could win him," his favor turned to fury; More refused to take an oath which pledged him to the lawfulness of the king's marriage with Anne Boleyn. He was committed to the Tower, where he remained thirteen months. On May 6, 1535, he was brought to trial at Westminster. It has been truly said that "no such culprit had stood at any European bar for a thousand years." He was convicted by the most flagrant perjury and injustice, and sentenced to the savage punishment for high treason. He suffered death in the Tower, July 6, 1535. In the words of Addison: "The innocent mirth which had been so conspicuous in his life did not forsake him to the last." When he laid his head on the block, he desired the execu-
tioner to wait until he had removed his beard, "for that had never offended his high-
ness." His head was placed on London bridge, but was taken down and preserved by
his favorite daughter, the admirable Margaret Roper, the story of whose tenderness and
devotion will live as long as the English language endures. His Clapius is the conception
of an imaginary commonwealth, in which opinions are expressed of great boldness and
originality, and especially favorable to freedom of inquiry, even in religion. He, how-
ever, wrote against the Lutherans, and corrected the MS. of Henry's answer to Luther.
The terseness and liveliness of his sayings, his sweet temper and affectionate disposition,
his liberality, his learning and probity, combine to make a union of perfect simplicity
with moral and intellectual greatness, which will for ever endear his memory to his
countrymen of every sect and party.

MOREA, the name borne by the ancient Peloponnesus (q.v.) since the middle ages,
if not from as early a period as the 4th century. It is usually said to be derived from
morea, a mulberry—the outline of the peninsula bearing a resemblance to the leaf of
that tree. Others, however, such as Palmerston, trace it back to the Slavic word more,
theo, which nearly enunciates the Morea. The Morea forms the most southern part of
the kingdom of Greece, and is divided into the nomarchies of Argolis, Corinth, Laconia,
Messenia, Arcadia, Achaea, and Elis.

Overrun by the Goths and Vandals, it became a prey, in the second half of the 8th c.,
to bands of Slavic invaders, who found it wasted by war and pestilence. Gradually, however,
these barbarians were subdued and Greekized by the Byzantine emperors. Nevertheless,
the numerous names of places, rivers, etc., in the Morea of Slavic origin, prove how firmly
they had rooted themselves, and that the Moreotes are anything but pure Greeks. In
1267 the peninsula was conquered by French knights, and Achaea was formed into a
principality with all the feudal institutions of the west. After 1261 the Byzantine
emperor, Michael VIII. Palaeologus, reconquered part of the country; but the princi-
pality of Achaea remained in the family of Villachardon till 1340, when the male line
became extinct. In 1346, the last chief, Philip, however, left a son, who was the start
of the Morea. At length, in 1460, the greater portion of the Morea fell into the hands of the Turks,
who retained possession of it down to the period of the Greek revolution, except from
1827 to 1715, when it was held by the Venetians. The long struggle between the Turks
and Venetians diminished the population so much that in 1719 it had only 200,000 inhab-
itants, and the plagues of 1756 and 1782 even reduced it to half this number. After
the French revolution, however, it began to increase; at the outbreak of the war of inde-
pendence, in 1827, it had reached 300,000, of whom only one-sixth were Turks; and in
1870 it was 615,399.

MOREAU, JEAN VICTOR, the greatest general of the French republic, except Bona-
parte, was born Aug. 11, 1763, at Morhix, in Bretagne; was the son of an advocate,
and was sent to study law at Rennes. He took the side of the revolution, was chosen to
command the battalion of volunteers from Rennes, served under Dumouriez in 1793, and
displayed such military talent, that in 1794 he was made a general of division. His
father was put to death by the guillotine under the reign of terror, and Moreau hesi-
tated for a moment, but resolved that he could not withdraw from the service of his
country. When Pichegru fell under suspicion, the directory appointed Moreau, in the
spring of 1796, to the chief command on the Rhine and Moselle. He crossed the Rhine
at Kehl, defeated Latour at Rastatt, and the archduke Charles at Ettlingen, and drove
the Austrians back to the Rhine. But, in advancing up the Rhine, he was met with an
hostile combination with the directory, Moreau found himself in danger of being cut off from the Rhine, and was obliged to make a desperate effort to
regain that river, which he accomplished, notwithstanding great difficulties, by a march
of forty days. This retreat established his reputation for generalship more than all his
previous victories.

A suspicion of participation in the plots of Pichegru led to his being deprived of his
command, after the corps d'etat of 18th Fructidor. In the following year he succeeded
Schérer in the command of the army in Italy, when it was hard pressed by the Russians
and Austrians, 25,000 men being opposed to 80,000. By a retreat conducted with con-
summate skill, and in course of which he even gained victories, he saved the French
army from destruction. The directory, nevertheless, deprived him of the chief com-
mand, and gave it to Joubert. But Moreau remained with the army, and asked that
young general to the utmost; and after his death at Novi, again assumed the command,
and conducted the defeated troops to France. The noble disinterestedness of Moreau's
character, his military talent, and his political moderation, induced the party which
overthrew the directory, to offer him the dictatorship of France, which he declined, and
left his assistance to Bonaparte on 18th Brumaire. Receiving the command of the army
of the Rhine, Moreau gained victory after victory over the Austrians in the campaign of
1800, and at last won the great and decisive battle of Hohenlinden (q.v.). A strong feel-
ing of mutual distrust now arose between Moreau and Bonaparte, who sought in vain to
win him to himself; and Moreau's country-seat, to which he retired, became the gathering-
place of the discontented. Bonaparte surrounded him with spies, and ere long he
was accused of participation in the plot of Cadoudal (q.v.) and Pichegru against the life
of the first consul. He was arrested, brought to trial, and found guilty on 10th June,
1804, although the evidence against him was utterly insufficient. But Bonaparte could not venture upon a sentence of death, and a sentence of two years' imprisonment was therefore pronounced, which was commuted into banishment, and Moreau went to America, where he settled in New Jersey. Regarding with great dissatisfaction the whole of Bonaparte's further career, he thought it his duty to France to give his aid to the allies in the campaign of 1813, and leaving the United States in the company of a Russian agent, he landed at Gothenburg, had an interview with the crown prince of Sweden, the former gen. Bernadotte, and accompanied the emperor of Russia and the king of Prussia in the march against Dresden, where, as he stood with the emperor Alexander on a height at Rüegglin, on Aug. 27, a French cannon-ball broke both his legs. Amputation was performed, but he died at Laun in Bohemia, Sept. 2, 1813.

MOREAU DE SAINT MISY, MÉDÉRIC LOUIS ÉLIE, 1759-1819; b. in the isle of Martinique; educated in Paris; commenced life as an advocate, and not long after returned to his native island to practice his profession; amassed a fortune, and was charged by the French government to prepare a civil code for the French islands, which was published under the title, Loi e constituent le code civil de l'Amérique, de 1790 à 1783. Elected president of the electors of Paris in July, 1789; member of the constituent assembly for Martinique in 1790; a refugee to the United States, after the dominance of the Jacobins in Paris; there became a bookseller; was called to Bonaparte's council of state in 1800; administrator of the states of Paraíba, Parma, and Guastalla, in 1802, and there fell into disgrace for lack of energy against a militia revolt. In 1806 he was granted an audience by Napoleon, and said to him: "Sire, I do not ask to be recompensed for my probity. I ask only for its toleration." He became very poor afterward, until 1817, when Louis XVIII. granted him a handsome pension. His published works are Description de la partie espagnole de Saint Dominique and Description de la partie française de Saint Dominique, both published in Philadelphia in 1796-97-98.

MORECAMBE, an inlet of the Irish sea, on the n.w. coast of England, separates the main portion of Lancashire from the detached portion of Furness. It is about 10 m. in average breadth, and 16 m. in length. It receives the Kent, the Keer, and the Lune. The depth of water in the bay is never great except in the channels of the rivers; and when the tide is out, the water entirely withdraws for the time, and there is a road, although a dangerous one, across the sands from the vicinity of Lancaster into Furness.

MOREEN. See MOORE.

MOREHEAD, JAMES T., 1797-1854; b. Ky.; educated at the Transylvania university, and admitted to the bar. He served a number of terms in the legislature and was elected lieutenant-governor in 1832. He was governor 1834-38, and U. S. senator from Kentucky 1841-47. He published in 1845 a work on Practice and Proceedings at Law.

MOREHOUSE, a parish in n. Louisiana, adjoining Arkansas, bounded on the s.e. by the Bœuf Bayou river, on the w. by the Ouachita river, and drained by the Bœuf bayou and Battolo(?)new bayou; pop. 1806, 14,285-14,111 of American birth, 10,652 colored. The surface is undulating, and heavily wooded with oak, pine, cypress, and other trees. The soil is rich; the principal productions are Indian corn, cotton, and sweet-potatoes. Capital, Bastrop.

MOREL, Morelina, a genus of fungi, of the division hymenomycetes, having a fusiform stalk, and a roundish or conical pileus, the upper surface of which is divided into an irregular net-work of cells or pits, and bears the hymenium. They grow on the ground, and have a more or less agreeable smell and taste. Some of them are reckoned among esculent fungi, of which the best-known is the Common Morel (M. esculenta), a fungus rare in Britain, but common in many parts of the middle and south of Europe. Its stalk is only about an inch high, and it has a roundish, oval, oblong, or conical, yellowish or brown pileus. It is nutritious, and not difficult of digestion; but is chiefly used in sauces and gravies, on account of its pleasant flavor. It is used either fresh or dried, and is often brought to market in a dried state. It grows in lawns, and among fallen leaves in the thinner parts of woods where the soil is light and makes its appearance in spring. It makes excellent catchup. In Germany the morel is a highly popular dish, and as it very often is of the new, before the forest of Germany were often destroyed for its sake, till this practice was restrained by severe penalties. Its cultivation has not been attempted, although probably it would not be difficult.—A very similar species is M. pulchra, which is used in the same way; as is also the Bohemian Morel (M. Bohemicum), which has a stem 4 to 8 in. high, and thimble-shaped, obtuse, white-marginated pileus, with longish narrow pits of many various forms; abundant in Bohemia, and, when dried in a baker's oven, a considerable article of export. The name morel (morechel) is extended in Germany to some of the edible species of helvella (q.v.).

MORELL, JOHN D., b. England, 1815; studied philosophy, upon which he has written a number of books. His Historical and Critical View of the Speculative Philosophy of Europe appeared in 1846; Philosophy of Religion, 1849; and Elements of Psychology, 1855.

MORELIA, or VALLADOLID, a t. of Mexico, capital of the state of Michoacan, in a fine valley, surrounded by high mountains, 125 m. w.n.w. of Mexico. There is a magnificent aqueduct for the supply of water. It was the birthplace of Iturbide, the short-lived emperor of Mexico. Pop. 25,000.
MORELLA (anc. Castre-Éliz, the winter-quarters of Sertorius), a t. and important fortress of Spain, in the province of Castellon, about 80 m. n. of Valencia. Morella was the chief stronghold of Cabrera, who sealed the castle by ropes furnished by a partisan within, on the night of Jan. 25, 1838. It was retaken in 1840 by Espartero, after a brave defence. There are some interesting Roman and Moorish antiquities. Pop. 6,300.

MORELOS Y PARON, José María, 1780–1815; h. in New Mexico; curate of a village in Valladolid. The insurrection against Spanish rule was headed by Hidalgo, and to this movement Morelos joined himself in 1810, and received a commission as capt. gen. of the s.w. provinces. His first great exploit was the capture of Acapulco, where a large body of regular troops was surprised and routed by a few hundred insurgents, mostly negroes. This victory was preceded and followed by many gallant and well-planned movements; but when in 1813 he determined on the attack of Valladolid, contrary to the advice of his next in command, Matamoros (q.v.), he undertook a task beyond his strength. There, after a fierce contest, his forces were routed, and after sustaining for some time an unequal struggle, he was captured, tried, and put to death.

MORRESQUE. See Arabesque, Grotesque.

MORETO Y CABANA, Agustin, 1600–69; b. Spain. Little is known of his life. He wrote many plays, some religious, as The Most Fortunate Brothers; or heroic, like The Brave Justice of Castle; but the majority, "comedies of cloak and sword," in the old Spanish manner. His best drama, Dido in met with Disdoin, is founded on Lope's Miracles of Contempt, and was in its turn imitated by Molière in the Princesse d'Elde. The Don Diego of his play of that name has become the Spanish type and synonym for a coxcomb.

MORETON BAY, on the e. coast of Queensland, Australia, is formed inside the islands of Moreton and Stradbroke, the former 25 m., and the latter 35 m. in length, and both about 5 m. in greatest breadth. It is 63 m. in length (lat. 27° to 27° 55' S.) by 23 m. in greatest breadth. Its shores are rich in soil, and admirably adapted for agriculture. Its appearance is rendered picturesque and beautiful by the numerous islets, some of them capable of profitable cultivation, with which it is dotted over. Into this bay 5 navigable rivers, the Arrowsmith, Logan, Brisbane, Pine, and Caboolture, pour their waters. The entrance at the n. end is practicable at all times for vessels of the largest size; the entrance between Moreton and Stradbroke is narrow, and less safe.

MORETON-BAY CHESTNUT, Casuarinaeum Australis, a tree of the natural order leguminosae, sub-order pinnifoliaeae, a native of Queensland, Australia. It attains a height of 70 to 100 ft., has wide-spreading branches, pinnate leaves, and large racemes of beautiful red and yellow flowers. The pods are 6 or 7 in. in length, and the seeds are in size and quality somewhat like chestnuts.

MOREY FORGERY, an event of the presidential campaign of 1880, when James A. Garfield, the republican candidate for president, was charged with having written a letter favoring Chinese immigration in the interest of a supply of cheap laborers. The letter, purporting to be addressed to "H. L. Morey, Lynn, Mass.," was made public in a New York paper, Oct. 20, 1880; and on the 22d what purported to be a facsimile in lithograph or photo-engraving process from the original letter, was published in the same paper. On Oct. 23 Mr. Garfield, in two letters from Ohio, which were promptly made public, denounced the letter to Morey as "a bold forgery both in its language and sentiment," and denied that he had ever heard of the existence of such a person as H. L. Morey. The managers of the democratic campaign refused credence to Mr. Garfield's denial, and circulated an immense number of copies of the original letter, producing a profound impression throughout the country, particularly on the Pacific coast. There is reason to believe that the "letter," now conceded to have been a forgery by some hand undisclosed as yet (Mar., 1881), turned the vote of California in favor of the democratic candidate for the presidency.

MORGAGNI, Giovanni Battista, 1682–1771; b. Italy; studied medicine at Bologna, and physics and comparative anatomy at Padua and Venice. In 1706 he published Adversaria Anatomica, a treatise of marked originality, and 6 years later he was appointed professor of the theory of physic at Padua. In 1719 he published completely his collection of Epistola Anatomica, containing his observations for many years. His great work, De Sclibus et Causis Morborum per Anatomia Indagatis, which appeared in 1761, is still an authority on pathology. Morgagni was a man of vast learning in other branches, and in medicine he performed much the same service for pathology that Haller did for physiology.

MORGAN, a co. in n. Alabama, s. of the Tennessee river; 730 sq. m.; pop. 12,187—12,092 of American birth. The soil is irregular and mountainous. The soil in most portions is rich, and good crops of Indian corn, cotton, sweet potatoes, and oats are grown. Considerable molasses is made from sorghum. A portion is watered by Flint river. It is on the Memphis and Charleston, and South and North Alabama railroads. Co. seat, Somerville.

MORGAN, a co. in n. central Georgia, drained by the Appalache and Oconee rivers and their branches; 450 sq. m.; pop. 90, 14,031—9,788 colored; intersected by the Georgia
railroad. The surface is level or undulating, partly covered with forests and very fertile. Cotton, corn, and sweet potatoes are the staples. Limestone and granite are found; there are several saw-mills and tanneries.

MORGAN, a co. in w. Illinois, s.e. of the Illinois river; 350 sq. m.; pop. '70, 28,463—23,805 of American birth. It is mostly prairie, with occasional small tracts of timber. The soil is deep and rich, and produces immense quantities of corn, the annual production of which amounts to millions of bushels. Wheat and oats are also grown in abundance. There are large numbers of sheep, and wool-growing is cultivated with success. The chief manufacture is carriages; next in importance are agricultural tools, and machinery, flour, harnesses, and furniture. The Wabash, Chicago and Alton, Rock Island, Rockford, and Peoria, Pekin and Jacksonville railroads pass through it. Co. seat, Jacksonville.

MORGAN, a co. in central Indiana; 453 sq. m.; pop. '80, 18,859—18,602 of American birth. The surface is level in the n., but more irregular in the south. The soil is rich, and produces immense quantities of Indian corn, besides wheat, oats, tobacco, and potatoes. There are large numbers of cattle, and wool is exported. The White river and Mill and White Lick creeks flow through it. There is a heavy growth of timber. The Indianapolis and Vincennes, and Fairland, Frankland and Martinsville railroads cross it. Co. seat, Martinsville.

MORGAN, a co. in u.e. Kentucky, having a range of the Alleghany mountains for its e. boundary, drained by the Licking river, forming a part of its n.w. border; 330 sq. m.; pop. '80, 8,455—8,451 of American birth, 33 colored. Its surface is rough and hilly, a large proportion covered with forests of beech, cedar, hemlock, laurel, holly, etc. Its mineral products are iron, bituminous coal, alum and copperas, and oil springs appear in some sections. Its valleys are fertile, producing grain, potatoes, tobacco, wool, and dairy products. Some attention is paid to stock raising. Co. seat, West Liberty.

MORGAN, a co. in central Missouri; 600 sq. m.; pop. '80, 10,134—9,389 of American birth. The surface is uneven and hilly, and the soil fertile. The chief products are Indian corn, wheat, and oats. Pork and cattle are also staples. Bituminous coal, lead, and limestone are found. The county is drained by the Osage and Lamine river. There are extensive forests of elm, wild cherry, oak, hickory, and ash. The Missouri Pacific railroad runs along the n. border. Co. seat, Versailles.

MORGAN, a co. in s.e. Ohio, on both sides of the Muskingum river; 390 sq. m.; pop. '80, 29,074—341 foreign. The surface is uneven and diversified. The soil is fertile, and the principal crops are corn, wheat, tobacco, oats, and potatoes. The growing of wool is an important industry. There are extensive deposits of salt. There are a number of flour mills, tanneries, carrying shops, salt manufactories, and carriage shops. Co. seat, McConnelsville.

MORGAN, a co. in n.e. Tennessee, watered by Emory and Obie's rivers; 640 sq. m.; pop. '80, 5,136—236 colored. The surface is irregular and mountainous, belonging to the Cumberland table-land. Much of it is covered with a heavy growth of oak, pine, and chestnut. There are extensive deposits of bituminous coal. The staples are Indian corn, oats, grass, tobacco, and butter. It is on the Cincinnati Southern railroad. Co. seat, Wartburg.

MORGAN, a co. in n.e. Umb.; 600 sq. m.; pop. '80, 9,266—8,243 of American birth. The surface is irregular and mountainous. The soil is not largely cultivated, but produces some barley and wheat. Gold is found in paying quantities, and coal and iron are known to exist. The Union Pacific railroad passes through it. Co. seat, Morgan.

MORGAN, a co. in West Va., on the Baltimore and Ohio railroad and the Potomac river; 375 sq. m.; pop. '70, 4,215. Large deposits of coal and iron are found within its boundaries. Co. seat, Bath.

MORGAN, CHARLES W., 1796—1853; b. Va.; entered the navy at an early age, and was one of the officers of the ship Constitution at the time of the engagement with the men-of-war Guerri're and Java in 1812, when he rendered such conspicuous service that the legislature of Virginia, in recognition of it, presented to him a sword. From 1841 to 1843 he commanded the Mediterranean squadron. He was a nephew of Daniel Morgan, a brig. gen. in the revolutionary war.

MORGAN, DANIEL, 1737—1802; b. N. J. When 17 years old he emigrated to Virginia, where he worked as a farmer for some years. Next, he shared in the perils of Braddock's expedition against the Indians, probably as a wagoner, and received a wound in his neck and face that greatly disfigured him. It is stated, also, that during this campaign he was unjustly punished by 500 lashes for some fancied indignity to an officer. At the breaking out of the revolution he was given the command of 75 men enlisted in his neighborhood, with whom he rode to Boston, a distance of 600 m., to join the main army, where he was detached in the expedition against Quebec. In the attack on that city he distinguished himself by bravery and courage, but he was finally taken prisoner. After being exchanged he was appointed col. of a Virginia regiment, and further promotion rapidly followed. In 1780 he received a brig. gen.'s commission; was attached to the army in the south; and won the memorable victory at Cowpens over Tarleton, for
which congress awarded him a gold medal. Shortly afterwards ill-health obliged him to retire to his farm, and he did not become conspicuous again until the "whisky insurrection" in Pennsylvania in 1794, when he commanded the Virginia militia against it. After this he was a member of congress from Virginia one term. Died at Winchester, Va.

MORGAN, EDWIN DEXNISON, b. Mass., 1811. He received a common school education, and when about 17 entered a business firm at Hartford, Conn., and in 1831 became a partner. In 1836 he started a wholesale business in the city of New York, and soon acquired a large fortune. He served as a state senator 1849-53; was afterwards chairman of the republican committee, and in 1859 was elected governor of New York and served two terms, 1859-63. His administration was marked by the introduction of several local reforms, the reduction of the state debt, and improved management of the canals; he also displayed great vigor in assisting the general government at the outbreak of the civil war, and was given the rank of major-gen. of volunteers. At the end of his term of office he was elected U. S. senator. In 1864 President Lincoln offered him the position of secretary of the treasury, but the honor was declined. Since that time he has remained in New York, conducting his extensive business, but taking great interest in politics. In 1875 he was again the republican candidate for governor, but was defeated by Lucius Robinson. He has presented the sum of $100,000 to the Union theological seminary, of New York.

MORGAN, GEORGE WASHINGTON, b. Penn., 1829; after serving in the Texan war for independence in 1836, he entered West Point, but left without graduating, and took up the study of law. On the outbreak of the Mexican war, he raised a regiment of Ohio volunteers, attached to the command of gen. Taylor. In 1847 he was made colonel in the regular army, and served under gen. Scott in command of the 15th U. S. infantry. For gallantry at Contreras and Churubusco, he was brevetted brigadier. He was appointed U. S. consul at Marseilles in 1855, and minister to Portugal in 1858. In the war of the rebellion, he commanded divisions in the army of the Ohio and the army of the Tennessee, but resigned, on account of ill health, in 1863. He was a member of congress from Ohio from 1871 to 1875.

MORGAN, Sir Henry John, about 1635-90; Welsh descent: trained to the sea and for some time served under Mansfield, at whose death he assumed command of a fleet of twelve ships, and as an English buccaneer preyed on the commerce of the West Indies. He carried Portobello by assault, in 1669 retired to Jamaica with a large fortune, but in 1670 again took command of a large fleet and ravaged the coast of Nicaragua. The next year he marched upon the city of Panama, and with less than 1500 men captured and burned the city. Peace having been made, he visited England, was knighted by Charles II., and appointed governor of Jamaica, where he died.

MORGAN, James D., b. Mass., 1810; in boyhood shipped in the Beverley, and barely escaped with his life, as the crew mutinied and the ship was burned. The boat in which he escaped reached the South American coast, and Morgan endured many privations and hardships in returning home. He served as captain in the Mexican war; when the rebellion broke out was commissioned lieutenant-col. of the 7th Illinois volunteers, distinguished himself at New Madrid and Corinth, and in 1862 was made a brigadier, and served in the Tennessee campaign, afterwards commanding a division of the 14th corps in Sherman's march to the sea.

MORGAN, John H., 1826-64; b. Ala.; settled in the vicinity of Lexington, Ky., in 1820. He was engaged in the war with Mexico, holding a commission of 1st lieu. in Marshall's cavalry, and was present at the battle of Buena Vista. He was afterwards in business in Lexington, manufacturing bagging, but in 1861 attached himself to Buckner's army, being in command of the Lexington rifles, which he afterwards left, and commanded a squadron of cavalry at the battle of Shiloh. He however, left the regular confederate service and engaged in guerrilla warfare on his own account, with a band of adventurers, who made the name of "Morgan's raiders" remembered with terror wherever they appeared. The extraordinary cleverness and success of his movements gave him a high and peculiar military reputation, seriously modified by the utterly irregular character of his modes of warfare. Following close after the union armies, he destroyed military stores, burned railroad trains, tore up tracks, demolished bridges, and generally harassed and despoiled the enemy after a fashion of his own. He was even sufficiently enterprising and ingenious to keep a telegraph-operator with him in his movements, by whose aid he was enabled to spread false intelligence concerning them, and also obtain constant information with regard to the attempts which were being made to interfere with his rapid operations. He was finally captured, with nearly his whole command, while making a bold raid through Kentucky, Indiana, and Ohio. He was imprisoned in the Ohio penitentiary, but succeeded in escaping, and fled into Tennessee, where he soon, after organized another raid, which proved to be his last. He was betrayed and captured by federal cavalry at a farm-house, where he was stopping, in Greenville, Tenn., and killed while seeking to escape.

MORGAN, Lady (Sydney), was the daughter of a theatrical manager, named Owen-son, who settled in Dublin. It is usually stated that she was born in 1786, but as she refuses to tell the date of her birth, "because dates are so cold, false, and erroneous," the
reader of her autobiography will do well to add about ten years to her age. Her father fell into pecuniary difficulties, and the clever, bold, and lively young woman resolved to support the fortunes of the family, first as governess, and then as author. She wrote *The Wild Irish Girl* in 1806. A lady novelist was then rare, and Irish subjects were less hackneyed than they have since become. Sydney Owenson obtained a footing in the household of the marquis of Abercorn, in whose establishment her future husband, Dr. Morgan, held the post of private physician. The lord lieutenant was persuaded to make a knight of Dr. Morgan, and the newly wedded pair set up for themselves in Dublin. Here she wrote the *O'Donnel*. The opening of the continent in 1814 attracted the Morgans to Paris. Lady Morgan obtained admission into the highest society, corresponded with several celebrities, and wrote a work on *France*, which was eagerly received and vehemently praised and censured by critics of different political opinions. In 1818 the Morgans went to Italy—the wife to sketch manners, scenery, and society, while Sir Charles was to contribute chapters on politics, science, and education. Lady Morgan was received with great hospitality by the Italian nobility and the foreign visitors at Rome. Her *Italy* appeared in 1821, and proved one of the most successful and remunerative of her works. In 1824 the Morgans came to London, and in 1825 lady Morgan began to keep a diary, which contains some amusing bits of literary, fashionable, and political gossip. Her reputation as an authoress became obscured, but she continued to the end of her career to assume the twofold character of the lady of fashion and the woman of genius. She succeeded in obtaining from the Whig government a pension of £300 a year, in acknowledgment of her literary merits, and partly, also, in recognition of the unjust and virulent attacks to which she had been subjected for having, in her earlier works, exposed the wrongs of her native country. She died in 1839, having continued busy with her pen and her tongue to the last; and leaving behind a great mass of correspondence of little intrinsic value and interest, which, with a memoir, her autobiography, and diary, was published in 1842, in 2 vols. Her descriptions of high life have much raciness and vigor, and her Irish sketches—the famous "Jog-day," in *The O'Briens and the O'Flahertys*, deserving special mention—are perhaps the best account of that rackety, humorous, sentimental existence which was at once the charm and bane of Ireland, and which has but lately passed away.

MORGAN, Lewis Henry, b. N. Y., 1818; educated at Union college, and admitted to the bar. He began the practice of law at Rochester, in 1844, and retired in 1854. He is one of the first authorities on ethnology and anthropology. In 1831, he published his *Leafage of the Hunter*, a law of the customs and institutions of the six nations. His investigations were particularly directed to the systems of family relationship prevailing among savage tribes; and in pursuit of his inquiries, he addressed letters to missionaries and U. S. consuls residing in the vicinity of barbarous nations. By this means he collected a large body of information, which is contained in his *Systems of Consanguinity and Affinity of the Human Family*, which was published by the Smithsonian institution in 1870. Some of the theories advanced in this work have met with considerable opposition from students of anthropology; as, for instance, from Mr. McLellan in his well-known book on *Primitive Marriage*. But the value of Mr. Morgan's researches as to facts has been universally recognized. In 1868 he published a work on *The American Beaver*, containing the results of his personal observations near Lake Superior. Mr. Morgan has been a member of both branches of the N. Y. legislature.

MORGAN, Sir Thomas Charles, 1783-1843, b. England; educated at Eton and Cambridge. He took a medical degree in 1809, and began the practice of his profession in London. He was knighted in 1811, and soon afterwards established himself in Ireland, where, after giving up his practice, he devoted himself to literature and to the promotion of Roman Catholic emancipation. He published *Sketches of the Philosophy of Life; The Philosophy of Morals;* and with lady Morgan, *The Book Without a Name.*

MORGAN, William. See Anti-Masons.

MORGAN, William F., s.t.d., b. in 1818 at Hartford, Conn.; graduated at Union college, N. Y., and at the Episcopal theological seminary in New York. For more than twenty years he has been rector of St. Thomas's church in New York, holding high place among the clergy of his denomination as a writer and preacher. A collection of his sermons has been published.

**MORGANATIC MARRIAGE** (Goth. *morganan*, to curtail, limit), sometimes called *left-handed marriage*, a lower sort of matrimonial union, which, as a civil engagement, is completely binding, but fails to confer on the wife the title or fortune of her husband, and on the children the full status of legitimacy or right of succession. The members of the German princely houses have for centuries been in the practice of entering into marriages of this kind with their inferiors in rank. Out of this usage has gradually sprung a code of matrimonial law, by which the union of princes with persons of lower rank, in other than morganatic form, involves serious consequences, especially towards the lady. The penalty of death was actually enforced in the case of the beautiful and unfortunate Agnes Bernauer (q. v.). In the 16th and 17th centuries, a fashion began among German princes of taking a morganatic wife in addition to one who enjoyed the complete matrimonial status—hadgravine Philip of Hesse setting the example, with a very qualified dis-

U K X—14
appellation on the part of the Lading Reformers. An energetic attempt was made in the first half of the last c. by Anton Ulrich, duke of Saxe-Meiningen, to upset the established practice, and obtain for his morganatic wife the rank of duchess, and for her children the right of succession. In deference to the united opposition of the whole principality of Germany, the emperor refused the duke's suit, declaring that there could be no marriage in princely families without "ebensoirtigkeit," or equality of birth. In the present c. morganatic marriages are by no means on the decline among the German reigning houses—one of the best known and most remarkable instances being the union of the late Archduke John, the "reichsverweiser" of 1848, with the daughter of the postmaster of Aussee, in Styria, afterwards created countess of Meran. Morganatic marriages are recognized not only among the princely families, but among the higher aristocracy of the empire; and in Prussia even the "niedere adel," or inferior gentry, may contract unions of this kind. A sort of fifteenth-century or hand-fasted marriage was recognized in early times in the Highlands of Scotland, and in Sweden: the hand-fasted bride could be put away, and a fresh union formed, with the full status of marriage. Unlike the case of German morganatic marriages, the issue were often accounted legitimate, even to the prejudice of the children of the more regular union that followed. The Royal Marriage act, 12 Geo. III. c. 11, reduces to a position somewhat like that of morganatic unions every marriage in the royal family of Great Britain not previously approved by the sovereign under the great seal, provided the prince entering into it is under 25, and every such marriage of a prince above 25 which is disapproved by parliament.

MOGARTEN, a mountain slope on the e. margin of lake Egeri, in the canton of Zug, Switzerland, has acquired a world-wide celebrity as the scene of a great victory won by the Swiss forest cantons over the Austrians Nov. 15, 1313. The Swiss, who had command both of the narrow pass which wound between Mogarten hill and the lake, and of the adjoining heights, numbered only 3400 men, while the Austrians amounted to 15,000, and were led by duke Leopold, brother of the German emperor. When the Austrian troops had fairly entered the pass, those of the Swiss posted on the rocks above hurled down great masses of stone, which threw the enemy's cavalry into confusion, besides killing immense numbers of them. Their comrades who held the pass, taking advantage of the disorder, now charged the Austrians repeatedly, and utterly routed them. Only a few escaped, among whom was duke Leopold himself.

MORGENSTERN, CHRISTIAN, 1805-67; b. Germany; studied painting in the school of Bendisen. He afterwards studied at the Copenhagen academy of fine arts, and in 1830 took up his residence in Munich, where his first exhibited picture was "The Heath of Limeburg." He exhibited a picture on the same subject at Paris many years afterwards. He was a good landscape painter, and also an etcher of merit. His best pictures are studies from the scenery of Heiligoland.

MORGHEIN, RAFAEL SANZIO CAVALIERE, a famous etcher, was b. at Florence, June 19, 1758. His first instructor in the art of engraving was his father, who, according to some, was a German or the son of a German. The indications of talent that he gave were such as to induce his father to place him under Volpato at Rome. His progress then became very marked. Raphael's celebrated figures in the Vatican of "Poetry" and "Theology" were engraved by him in 1781; and he afterwards produced a succession of engravings of a very high class from many of the masterpieces of art: amongst these may be enumerated his prints from Raphael's "Madonna della Seggiola," the "Madonna del Sacco," by Andrea del Sarto; the "Transfiguration," by Raphael; the "Duke of Moncada," by Vandyke; and by his buria, Da Vinci's "Last Supper," notwithstanding its decay, has been rendered with such consummate skill, as to lessen the regret felt for the evanescence of the original work. He accepted an invitation from the grand duke to reside at Florence, with a pension of 400 scudi, and a free residence, under condition of keeping a public school; and received marked attentions from the emperor Napoleon, to whom he dedicated his engraving from the "Transfiguration." Morghei died at Florence on August 8, 1833. He had married a daughter of Volpato's in 1781. His life, with a portrait, and a catalogue of his works, was published by his pupil Niccolo Palmarino. From this work it appears that he has engraved 75 portraits, 47 religious and 44 historical and mythological pieces, 24 views and landscapes, and 13 vignettes, crests, etc., 201 in all. The works of Morghei will always hold a very prominent place in the history of engraving. About the middle of last century, Strange had added a new feature to the art, by introducing, in a remarkable way, what is technically called by engravers "color," or the art of producing by management and variety of line a texture or quality that compensates to some extent for the want of the actual colors in a picture. This influenced the style of Volpato, Cuneo, and other Italian engravers of the period, who imitated, though with no very great success, the brilliancy produced by Strange. Morghei, however, went far beyond these Italian engravers, for in his works he united much that was good in the engravings of Strange with a more correct and a purer style of drawing, and thus brought out in a very high degree all the important qualities for which those masterpieces he so skilfully rendered are distinguished.
MORQUE, a French word, denoting the inner wicket of a prison, at which persons accused or condemned are kept for some time, in order that the jailers and turnkeys may examine them at their leisure, so as to be able to recognize them when occasion requires. Hence the application of the word to a certain building (La Morque) in the "city" (La Cité) of Paris, situated on the Quai du Marché neufl, where the dead bodies of persons unknown, found either in the river (Sèine) or in the streets, are exposed to public view for three days. The corpses are put under a glass case, on shelves made of white marble. They are wholly naked, except across the middle, which is covered with a piece of leather. The clothes are hung on the wall above. When a corpse is recognized it is handed over to the relatives or friends of the deceased, on payment of costs and dues—otherwise it is interred at the expense of the city. The number of bodies yearly exposed in the Morque is about 300, of which five-sixths are those of males.

MORQUE (ante). Morgues have been established in the principal American cities; in New York in 1866, in Boston in 1851, in Brooklyn in 1870, in Chicago in 1872, in St. Louis in 1874.

MORIAH, MOUNT. See JERUSALEM, ante.

MORI, the family name of the daimios or feudal princes of the provinces of Suwo and Nagato (or Chosun) in Japan. During the 16th and 16th centuries, the Mori family ruled 11 provinces, but after being lured by Taiko they held in fief only the provinces of Suwo and Nagato; and as such, were guardians of the straits of Shimonoseki (see Shimonoseki). Nagato was long the seat of Dutch learning, and many students were sent to Europe and America, though under the ban of the Yedo authorities.

The Mori family and their retainers were very active in the revolution of 1868, and took the field against the Tycoon, armed with American rifles. Among the many able men from this province were Kido, Hirosawa, Inouye, and other high officials and statesmen. Three cadet families formerly held fiefs under the feudal system. The Mori crest is a transverse bar under which are three balls.

MORI, ARIMORI, a Japanese statesman, b. in Satsuma about 1818. He was one of the first natives to escape from Japan and the repressive measures of the tyrant. Reaching England, he spent two years in study, and returning to Japan took a seat in the national legislature, proposing the abolition of the ancient custom of wearing two swords. This measure, though at first angrily condemned, was finally adopted. Mori was the first Japanese ever chosen to fill a permanent diplomatic post abroad. This was at Washington, D. C., as chargé d' affaires, in 1851. While here he composed a work on Life and Resources in America, which was translated and circulated in Japan. He also collected in a pamphlet the views of leading American educators on the subject of education for Japan, and petitioned the government in an able memorial on behalf of liberty in religious matters. Recalled in 1853, he was soon after sent as minister plenipotentiary to Peking, and assisted to secure the Japanese treaty with Corea, Feb. 27, 1856. In 1873 he was appointed minister plenipotentiary to the court of Great Britain, a post which he still holds. In 1874 he married a Japanese lady of Shukoku, according to the western principle of equality of goods and legal status—an innovation of great social influence on the position of women in Japan. Latterly he has written his name MAKEY.

MÖRIER, JAMES. 1780-1848; b. England; traveled extensively in the east, and described his journey in his Travels through Persia, Armenia, and Asia Minor. He afterwards resided for six years in Persia, as private secretary to the British minister, and became familiar with the character and customs of the inhabitants—a knowledge which he soon made use of in novels of eastern life. The first and most popular of these, The Adventures of Hajji Baba, appeared in 1824. It was followed by Zohrab, and Agesha, The Maid of Kars.

MÖRIKE, EUDARD. b. Württemberg, 1802; educated at the Stuttgart gymnasium, and Tübingen, where he studied for the ministry. He was for a time settled over a church, but was compelled to leave the ministry on account of ill-health, and became a teacher in Stuttgart. He has published a number of poems and novels, and translations of Theocritus and Anacreon. His Poems appeared in 1838; An Idyll of Lake Constance in 1846; and Four Tales in 1836.

MORILLO, PABLO, 1777-1838; b. Spain; count of Cartagena and marquis of Fuentes: entered the Spanish navy in 1793. During the war carried on by the Spaniards against Napoleon he raised a guerrilla corps, at the head of which he soon acquired reputation and became a lieuten. In 1815 he was placed in command of 12,000 men and sent to South America to conquer the insurgent provinces of Venezuela and New Grenada. After many alternations of fortune his army was routed and he was recalled. He then joined the court party and was believed to be one of the authors of an insurrection of the guards in July, 1822. After this he went over to the patriots, obtained command of an army corps, changed back again and submitted to the French intervention. His former treason, however, was not pardoned by the restored king, and he died in exile in France.

MORIN, ARTHUR JULES, b. Paris, 1795; educated in the polytechnic school, and in 1839 made professor of industrial mechanics in the conservatoire des arts et métiers of Paris. In 1843 he became member of the academy of sciences; in 1850 was appointed

The text appears to be a historical or academic document, discussing various topics such as the history of prisons, diplomatic relations, and the life of a Japanese statesman. It also includes references to historical figures and events, such as the Morque in Paris and the Mori family in Japan.
to aid in organizing an agricultural institute for France; in 1851 commissioner to the exposition of London; the following year director of the conservatoire, which place he retained till 1853; in 1855 was president of the executive committee of the Paris exposition, and in 1862 president of the society of civil engineers. Morin has occupied the unique position of receiving all the military grades up to gen., of division without leaving the duties of his directorship of the conservatory of arts and trades. He was the inventor of a dynamometer-crank by which the force of living motors is measured and the laws of momentum of falling bodies determined. His scientific publications alone form a library, beginning with 1831 and ending with 1871, and have been a fertile source of information to scientists and machinists of all nations.

MORION, an iron or steel head-piece worn by a man-at-arms in the days when armor was used. It was distinguished from the helmets of the knights and esquires in having neither visor nor beaver. Under the Norman laws every yeoman between certain ages was bound to keep his morion ready for service.

MORISON, John Hopkins, b. N. H., 1808; studied at Phillips Exeter academy, and graduated at Harvard college in 1835; was settled over the Unitarian society in New Bedford, Mass., and in 1839 in Milton where he still preaches. He published Life of Jeremiah Smith; Disposition and Notes on the Gospel of Matthew. He is now one of the editors of the Unitarian Review, and has been editor of the Monthly Religious Magazine; also a frequent contributor to the Christian Examiner and other Unitarian journals. He received the degree of d.d. from Harvard college. He is regarded as an evangelical Unitarian.

MORISON, Robert, M.D., one of the most eminent botanists of the 17th c., was a native of Aberdeen, and having borne arms as a royalist in the civil wars, retired to France about 1650, and became superintendent of the garden formed at Blois by Gaston, Duke of Orleans. After the restoration he was appointed by Charles II., one of his physicians, and "botanist royal," and became professor of botany at Oxford. He died in 1683. His great work is Plantarum Historia Universalis Oeconomicus (2 vols., 1675-99). He also wrote on umbelliferous plants.

MORISIO NIANISM, a name freely used to designate the distinctive tenets of the evangelical union (q.v.), but never accepted by that religious body. The system of doctrine so designated is fully enunciated in an authoritative document entitled Doctrinal Declaration, which was issued by the evangelical union conference of 1858—not as a fixed creed, but as a testimony to their distinctive faith. Being a recoil from the dominant Calvinism of Scotland, it is of the Arminian type, but without any Unitarianism savour. The charge of Pelagianism often urged against it is indignantly repudiated by evangelical unionists, and, with reference to some modern aspects of Calvinism, is by them spiritedly retorted. It is a form of doctrine, in fact, which very nearly corresponds to that type of evangelical Arminianism which obtains among the Wesleyans. Like that, it originated in an element of revival; and now, after the lapse of a generation, these same tenets are largely insisted on by revival preachers of the orthodox bodies at the present day. This coincidence is explained by the fact, need, in all efforts to bring men to religious decision, to give prominence to the universality of gospel grace, the duty of immediate faith, and the importance of peace with God as a subjective condition of the Christian life. It was these, and especially the doctrine that Christ died as an atonement in the same plenary sense for all men, which led to the separation, in 1841, of the rev. James Morison of Kilmarnock (now Dr. Morison of Glasgow) from the United Secession church, and of other three ministers at subsequent synods, and to the formation by them of the evangelical union in May, 1843. A theological academy was at the same time instituted, presided over by Dr. Morison, at which from 20 to 30 students annually receive training for the ministry. Many of these have gone to England, and some have obtained good positions among the nonconformists there. The evangelical union now embraces about four-score ministers and churches, all independent in polity, but many having ruling elders. In brief, the most distinctive doctrine of evangelical unionists is that which they prominently exhibit as the three great universalities of gospel grace—namely, the divine Father loves all, the divine Saviour died for all, the divine Spirit strives for the salvation of all. Believing in the entire freedom of the human will, they hold predetermination to be conditional. On such cardinal doctrines as the trinity, atonement, justification, and the like, they symbolize with other bodies known as evangelical.

MORLAIX, a sea-port of France, in the department of Finistère, 45 m. n.n.e. of Quimper. Vessels of 40 tons can reach the quays of the town. Pop. 76, 13,519.

MORLAKS, the name of a maritime people occupying the coast of Dalmatia on the Adriatic, and a part of Austro-Hungary. They are of the Slavic race; but are a distinct people, mostly sea-faring, and are drawn upon to man the Austrian navy. The territory occupied by them is called Morlaca, and the strait which separates it from the islands of Pag, Arbe, and Veglia, is known as the strait of Morlaca.

MORLEY, Henry, b. England, 1822; educated in Germany and at King's college, London; after which he taught a successful school near Liverpool. In 1847 he published some papers in respect to the public health, which attracted the attention of Charles
Dickens, and led to an engagement as assistant editor of Household Words, a position that he retained six years. Then he became one of the editors of the London Examiner and a lecturer at King's college. During these years he also published The Dream of the Lily Bell, tales and poems; Sunrise in Italy, poems; A Defense of Ignorance, lives of Edmund Burke, Sir Edward Gibbon, and Henry Cornelius Agrippa; and a collection of his contributions to Household Words; under the title of Foreign and Miscellaneous Literature. Since 1865 he has been professor of English literature in University college, London, and has written a large and a small History of English Literature, and an edition of The Spectator.

MORLEY, John, b. England, 1838; graduated at Oxford in 1858, and during several years afterward edited a journal called the Literary Gazette, and contributed to The Saturday Review. In 1867 he published an historical study of Edmund Burke, which introduced him to the general public, and shortly afterward he succeeded George Henry Lewes as editor of The Fortnightly Review, in which capacity he became well known as a political and religious radical. He contested the borough of Blackburn in 1869 for a seat in parliament, but unsuccessfully. Since then he has published The Limits of the Historic Method; The Struggle for National Education; Critical Miscellanies; and elaborate critical studies of Voltaire; Balzac, and Rousseau.

MORLEY, Thomas, d. 1604; b. England; graduated at Oxford, and was appointed, after studying music with William Birde, a "gentleman of queen Elizabeth's chapel," in 1592. He was familiar with the works of the Italian composers, and many of his compositions are madrigals and canzonets in the Italian manner. He also wrote a number of madrigals and the madrigals by different English composers, one of whom was the father of John Milton, in honor of Elizabeth, who appears in it as Oriana. The title of this book is The Triumphs of Oriana. Morley was also the author of a work called A Plain and Easy Introduction to Practical Musicke.

MORMONS, or, as they call themselves, THE CHURCH OF JESUS CHRIST OF LATTER-DAY SAINTS, are a religious sect founded by a native of the United States named Joseph Smith. Smith was the son of a farmer, and was born in the town of Sharon, Windsor co., Vt., Dec. 23, 1805. When he had reached the age of 10, his parents removed to Palmyra, in the state of New York, and four years later, to the town of Manchester, about 6 m. off. The reputation of the family is said to have been of the worst kind; we are told that they avoided honest labor, were intemperate, untruthful, and suspected of sheep-stealing and other offenses. These accusations are generally denied by Mormons but Smith himself partly admitted them, affirming that he "had never done anything so bad as was reported of king David, the man according to God's own heart." Nevertheless, a rude sensual religiosity appears to have been mixed up with his more earnest conflict. There is the most satisfactory evidence—that of his enemies—to show that from an early period he was regarded as a visionary and a fanatic. This fact is of the utmost importance as affording a clue to his real character, and an explanation of that otherwise unaccountable tenacity of purpose and moral heroism displayed in the midst of fierce persecution. A mere impostor,—i.e., a person who did not, in some sense or other, partly believe in his own mission, but who, on the contrary, felt that he was simply the liar and cheat that people called him,—would have broken down under such a tempest of opposition and hate as Smith's preaching excited.

"When about fourteen years of age," Smith says, "I began to reflect upon the importance of being prepared for a future state." I then describes how he went from one religious denomination to another, but could find nothing satisfactory—nothing but "a great clash in religious sentiment." Then he began to withdraw into secret places, to spend hours in prayer and meditation, and to receive angelic visits. The second of these happened on the evening of Sept. 21, 1823, when it seemed as though the house was filled with an "inspiring fire." In a moment a "personage" stood before him, "with a countenance like lightning," and "visible to the extremities of the body," who "proclaimed himself to be an angel of God." He informed Smith of various important particulars, as, "that his sins were forgiven, and his prayers heard; that the covenant which God made with ancient Israel was at hand to be fulfilled; that the preparatory work for the second coming of the Messiah was speedily to commence; that the time was at hand for the Gospel to be preached in its power and fulness to all the nations; and that Smith was chosen to be an instrument in the hands of God to bring about some of his purposes in this glorious dispensation." Besides all this, the angel gave him, by way of appendix, "a brief sketch of the origin, progress, civilization, laws, and governments" of the aboriginal inhabitants of America—"of their righteousness and iniquity, and the destroyers of God being finally withdrawn from them." He was also informed where some plates were deposited, containing an abridgment of the records of the ancient prophets that had existed on the American continent. The angel appeared to Smith thrice that night, and afterward paid him many visits. He told him where the records were deposited, "on the west side of a hill, not far from the top, about four miles from Palmyra, in the county of Ontario, and near the mail-road, which leads thence to the little town of Manchester." He advised him to go and view them, which Smith did; but the prophet was not yet holy enough to obtain possession of them.

* The origin of this name will appear in the sequel.
Mormons.

At length, after due disciplinary probation, the angel of the Lord, on Sept. 22, 1837, placed in Smith's hands the wonderful records. They were engraved on plates nearly 8 in. long by 7 wide, a little thinner than ordinary tin, and bound together by three rings running through the whole. The volume was altogether about 6 in. in thickness, a part of which was sealed. The characters, letters, or hieroglyphics upon the unsealed part were small, and beautifully engraved. They represented an unknown language called the "Reformed Egyptian." Along with the records was found a curious instrument, called a "rim and thumbnail," consisting of two transparent stones set in the rim on a bow fastened to a breastplate. By means of these stone appendages, God enabled him to understand and translate the ancient records into such humble English as the "prophet" (who had received almost no school-education, and could read with difficulty) was master of. The records contain the primitive history of America, from its first settlement by a colony that came from the tower of Babel, at the confounding of languages, to the beginning of the 5th c. of the Christian era. These primitive colonists were called Jaredites; they were a wicked and bloody race, and finally, like the Kilkenny cats, mutually destroyed each other, millions being slaughtered in the final conflicts. Silence again settled down upon America. But a new race came directly from Jerusalem about 609 B.C. These consisted of Lachi and his wife; his four sons, Laman, Lemuel, Sam, and Nephi, together with their four wives; two "sons of Ishmael," and their two wives; Zoram, a servant, and his wife; in all, 16 men and women. They are supposed to have landed on the coast of Chili. After the death of Lachi, quarrels broke out among the brothers. The Lord had appointed Nephi to be the leader of the new race of colonists but his elder brothers would not hear of it; as a punishment for which, they and all their posterity were condemned to have dark skins, and "to become an idle people, full of mischief and subtility, which did seek in the wilderness for beasts of prey." They are the ancestors of the American Indians, who are thus, according to Smith's records, simply bad Hebrews. The descendants both of Nephi and of his rebellious brothers, increased and multiplied, but were almost continually at war with each other. In the time of Nephi the second an awful earthquake announced the Crucifixion. Three days afterward Christ himself appeared out of heaven; showed the Nephites his wounded side and the print of the nails; instructed them for forty days in the truths of Christianity; healed the sick, blessed children, administered the sacrament, and planted churches, with apostles, prophets, pastors, teachers, and evangelists—the same order, the same priesthood, the same ordinances, gifts, powers, and blessings as were enjoyed on the eastern continent. Hostilities, however, between the Nephites and their dark-skinned brethren continued to rage as fiercely as ever; gradually the purity of their faith declined; and finally, in 384 A.D., a decisive conflict took place at the hill Cumorah, in western New York, where the Christian Nephites were nearly annihilated; miracles now ceased, and unbelief gradually became supreme. Shortly before this, however, a prophet called Moroni had been commissioned by God to write an abridgment of all their prophecies, histories, etc., and to hide it in the earth, till God should see fit to bring it forth, and "unite it with the Bible for the accomplishment of his purposes in the last days." This is the famous Book of Mormon, believed by the followers of Smith (hence called Mormons and Mormonites) to be of equal authority with the Jewish and Christian Scriptures, and to form an indispensable supplement to them, containing God's revelations to the new, as the others to the old world. In 420 A.D. they were finally sealed up where Smith found them, by Moroni, one of the few survivors of the battle of Cumorah.

The way in which Smith translated was as follows: he sat behind a blanket hung across the room to keep the sacred records from profane eyes, and read off by the help of his "rim and thumbnail," to one Oliver Cowdery, who wrote down what the invisible "prophet" gave as a translation—Smith himself being, as he confesses, but a "poor writer." A farmer, of the name of Martin Harris, supplied Smith with the necessary funds to get the work printed. The Book of Mormon finally appeared before the world in 1830, with the names of Oliver Cowdery, Martin Harris, and David Whitmer appended to a statement that an angel of God had come down from heaven and shown them the original plates. This was immediately followed up by the testimony of eight other witnesses, among whom were Smith's own father and two brothers (suspected, however, it must not be forgotten, of being addicted to sleep-walking and other of fabulous practices), who affirmed that "Joseph Smith, junior," had shown them the mysterious plates. The, however, are the only persons who have been so privileged. No other human being has ever seen them. Like Macpherson's Ossianic MSS., they have never been forthcoming, however loudly demanded, and of late years all knowledge of them has become traditional.

Attention was soon drawn to the newly published work, and a controversy sprung up regarding its real authorship. Evidence was brought forward by the opponents of Smith to show that, with the exception of certain illogical and ungrammatical interpolations, bearing on religious matters, the so-called Book of Mormon was really borrowed or stolen nearly verbatim from a MS. romance written by a quondam clergyman, named Solomon Spalding, who died in 1816. It is unnecessary to go over the arguments pro and con. Suffice it to say, that anti-Mormons generally think them conclusive; while the "saints" consider the whole story of Spalding's MS. romance a scandalous fabrica-
tion. About 1829 Smith became acquainted with one Sidney Rigdon, originally a compositor and preacher, but by this time had begun to promulgate a species of incipient Mormonism, and had managed to found a little sect of his own. It is conjectured that the opposition of New Jerusalem to what Smith was doing is supposed to have fallen for some time gave it to his new associate to further his purposes, and that the latter—in whose soul there may have been (according to our theory of his character) some rude and gross religious notions and feelings—devised the ungrammatical interpolations. This theory requires some probability from the fact that these religious passages do not refer to old-world faiths and the practices of an ancient ritual, but to quite modern questions, such, we are told, as were rife in the villages of western New York about 1830. Calvinism, Universalism, Methodism, Millenarianism, Roman Catholicism, are discussed, if not in name, yet in reality. Infant baptism is condemned; so strange to say, are polygamy and freemasonry.

Undeterred, nevertheless, by exp. sure, ridicule, and hostility, Smith and his associates persevered in preaching their “doctrine,” which was a new Americanized phase of millenarianism. They declared that the millennium was close at hand, that the leaders were soon to be converted, and that the New Jerusalem—the final gathering-place of the saints—was to be somewhere in the heart of the American continent. The “prophet’s” house “was frequently beset by mobs and evil-designing persons; several times he was shot at, and very narrowly escaped;” but his fearless courage continued to bring him disciples; and on April 6, 1830, the Church of Jesus Christ of Latter-day Saints was first organized in the town of Manchester, N. Y. Smith was thereby attacked by the leaders and preachers of the other religious denominations, but he kept his ground stubbornly, argued pretty well, and when argument failed, had recourse to a style of zealous prophetic asseveration, which is generally irresistible with weak and ignorant people. If the orthodox preachers, however, could not baffle him in speech, they knew how to inflame their hearers with the most ferocious animosity against the new sect; and in Jan., 1831, Smith and his followers were considered by the prudent to be on the verge of war, if not war, by the whole of the country. They established themselves at Kirtland, in Ohio, which was to be the seat of the New Jerusalem. They now made immense progress. Their missionaries were full of zeal (none more so, however, than Smith himself), converts were made in great numbers, and churches were established in the states of Ohio, Pennsylvania, New York, Indiana, Illinois, etc. Still the eyes of the new sect turned westward—to the region of the great prairies, where they might be allowed to work out their system in peace and freedom. In the autumn of 1831 a colony was established in Jackson co., Mo., which a “revelation” given to Smith assured the saints was “the land of promise and the place for the city of Zion.” Land was largely bought; preaching was vigorously carried on, a printing-press was established, a monthly periodical, The Morning and Evening Star, and a weekly newspaper, The Upper Missouri Advertiser, were started to propagate the doctrines of the new sect; everywhere was visible a spirit of industry, sobriety, order, and cleanliness. It is only fair to the Mormons to state these things. Account for it how we may, they were, in many important respects, morally, socially, and industrially, far in advance of their neighbors. When Smith returned to Kirtland, he set up a mill, a store, and a bank, and continued his propagandist labors with great success, but not without savage persecution; thus, for example, on the night of Mar. 22, 1832, a mob of Methodists, Baptists, Campbellites, and other miscellaneous zealots, broke into the prophet’s house, tore him from his wife’s arms, hurled him into an adjoining meadow, and tarred and feathered him! Sidney Rigdon was similarly handled, and rendered temporarily insane. Smith, however, unattended by this brutal treatment, preached next day with his “flush all scarified and detaoed,” and proved the folly of persecution by baptizing three new converts in the afternoon. Meanwhile, the brethren in Missouri continued to prosper, but this very circumstance deepened the animosity towards them of all who were not Mormons. Whispers also began to be spread about their indulging in a community of wives. The rumor was not true, but it probably originated in Rigdon’s理论 of the “spiritual wife,” which Smith at first denounced, but afterwards accepted, and thereafter commenced “sealing wives” to himself in some mysterious way that Gentiles cannot yet fathom. The first step towards polygamy—a doctrine not yet revealed, however (in fact, contrary to the “revealed” doctrine on the subject), materially helped to inflame the hostility of the impal-iye and unsensupal-backwoodsmen. Secret societies (according to Smith, composed “of the basest of men”) were formed to expel the Mormons from Missouri; their perils here were stopped, their printing-press confiscated, their bishops tarred and feathered, and numberless other outrages were committed. Finally, the hapless converts, who camped to fly across the Missouri river, and their children had to camp in the open wilderness on a winter-night in 1833. They subsequently settled in Clay co., in the same state, where they remained upwards of three years. In July, 1834, they were visited by the “prophet” himself, accompanied by 180 persons, mostly young men, and nearly all priests, deacons, teachers, and officers of the church. During a brief residence of one week among them, he accomplished much in the way of vigorous organization; next year, 1835, a further step was taken in the development of a hierarchy by the institution of a body of apostles—twelve in number—who were sent out to preach the new doctrines among the Gentiles. One of these twelve was the famous Brigham Young, who had become a convert about the close
Mormons.

of 1832, and had soon shown hims If to be a man of wonderful sagacity and force of character. He was ordered down east among the Yankees, and made numerous converts even among this a\\tte people. In 1837 Orson Hyde and Heber C. Kimball were dis\\tpatched as missionaries to England, where they received large accessions to their numbers, especially from the masses in the great manufacturing and commercial towns, Manchester, Liverpool, Leeds, Birmingham, Glasgow, and, above all, from the mining districts of South Wales, where Mormonism, in some places, almost competed for popularity with Methodism itself. Since then they have extended their strange evangelization to the East Indies, Australia, the islands of the Pacific, Egypt, Palestine, Turkey, and almost every country on the continent of Europe.

About the close of 1837 or the beginning of 1838, the bank at Kirtland stopped pay-
ment, and proceedings were taken against the prophet and others for swindling. Luck-
ily, just at this moment, he received a "revelation" to depart into Missouri, which he instantly obeyed, with all the more alacrity that internal disorders had painfully mani-
manifested themselves in the new colony. There were at last healed; but the conflict between the saints and the other Missourians became fiercer, more envengoned, more sanguinary than ever, assuming, in fact, almost the proportions of a civil war. The prophet and Legion were thrown into prison, and finally, towards the close of 1838, the whole body of saints, about 15,000, quitted Missouri, and took refuge in Illinois. Here they obtained a grant of land in the vicinity of the little town of Commerce, a name which the Mor-
mons, in obedience to a "revelation" given to Smith, changed to Nauvoo, or the city of beauty. The country was a mere wilderness when the Mormons settled in it; it soon became densely populated. (Louis Gunnison, a loyal pioneer and genuine emigrant, [a companion writer]) is forced by facts to be eloquent in praise of Mormon initiative, and gives us a perfectly enchanting picture of the new colony. The legislature of Illinois granted a charter to Nauvoo; a body of Mormon militia was formed, under the name of the Nauvoo legion, of which the prophet was appointed commander; he was also appointed mayor of the city, and was thus supreme in all matters civil and military, as well as religious. But the doctrine of "sealing wives" once more roused the wrath of the neighborhood, and serious disturbances took place, the ultimate result of which was that the prophet and his brother Hyram were thrown into prison at Carthage. After a short time it began to be rumored that the governor of the state was desirous of letting the two Smith's escape, wherupon a band of "roughs," about 250 in number, broke into the jail, June 27, 1844, and shot them. Disastrous as this termination of his career was to Smith him-
self, there cannot be the shadow of a doubt that it was a most fortunate thing for the system. The evangeline of Mormonism was in the midst of a general spirit of confusion, of solemn and tender glory now encircles the memory of one who stood greatly in need of this spiritual transfiguration. It may here be stated that it cannot be shown that Smith was a polygamist, in our sense of the word. Years after his death, Brigham Young produced a paper which he said was a copy of a "revelation" made to Joseph at Nauvoo, commanding him to take as many wives as God should give him. But it was not till Aug. 29, 1852, at a public meeting held in the Salt Lake City, that the "revela-
tion" was formally received.

Smith's death created great agitation and confusion among his followers. Sidney Rigdon and others aspired to succeed him, but the council of the twelve apostles unani-
mously elected Brigham Young, and events have shown the wisdom of their choice. The legislature of Illinois having revoked in 1835 the charter given to the city of Nauvoo, and the hostility of their neighbors not having in the least abated, the saints resolved to emigrate far beyond the boundaries of civilization, and to seek a new home amid the solitudes of the Rocky mountains, where they might pass their lives in unmolested peace. Explorers were sent out to examine the country, and brought back a favorable report of the Great Salt Lake valley. See GREAT SALT LAKE, SALT LAKE CITY, and UTAH. In Feb., 1846, the first emigrants crossed the ice-bound Mississippi, settled for a year in Iowa, and then marched under the strictest discipline across the great wildernesses. Agricultural operations were commenced almost the instant they arrived at the shores of the Salt lake. The cheerfulness, intelligence, and zeal exhibited on all sides, were truly admirable. The world has never seen swifter, more active, more glad hearted colonists than these singular "saints." It would be unfair to shut our eyes to such facts. In judging Mormonism, we must keep them constantly in view, to prevent us from forming mere abstract and theoretical decisions, which will not in the least affect the future of Mormonism. Brigham Young arrived in the valley July 24, 1847, and the main body of the Mormons in the autumn of 1848. The Salt Lake City was soon founded, an emigra-
tion fund established, and settlers poured in from all parts of Europe and America; and perhaps a greater amount of physical comfort was enjoyed here than in any other part of the world. In 1850 the government of the United States admitted the region occupied by the Mormons into the union as a territory, under the name of Utah, and Brigham Young was appointed governor by president Fillmore. District judges were also appointed by the federal government, but these were looked upon with great suspicion and mistrust by the saints, who finally drove them out of the country in 1851. Brigham Young was now suspended from his office of governor, and, after some time to withdraw from the country. During the next two years the collisions
between the U.S. officers and the saints became more and more frequent, and in the spring of 1836 the whole of the former were forced to flee from the territory. A new governor, Alfred Cumming, was appointed by the authorities at Washington in 1857 and also a new superintendent of Indian affairs; besides a force of 2,500 men was sent to enforce obedience to the laws of the United States. The saints attacked their supply trains, and compelled the enemy to winter at some distance from the Salt lake.

In the early part of next year negotiations were entered into between the contending parties; the Mormons submitted to the federal authority, and the federal troops were allowed to encamp on the western side of lake Utah, about 40 m. from Salt Lake City, where they remained till 1850, when they withdrew. After the close of the civil war, the United States seemed determined to insist on its authority. A federal governor was again appointed, and polygamy was declared in 1871 to be a criminal practice contrary to the laws of the United States; Brigham Young was even arrested. One of the most notable events in the recent history of the Mormons took place in the year of Brigham Young's death (1877). John D. Lee, a Mormon bishop, was brought to trial and executed for his share in a crime till then uninvestigated. In 1855 a party of Mormons and Indians, under Lee's command, assaulted a train of 150 non-Mormon emigrants at Mountain Meadows, near Utah, and massacred every soul of them. The complicity of the leaders of the church was not proved, but Lee had been clearly the immediate instigator of the deed.

Hierarchical Organization.—Mormonism is a pure theocracy: its priesthood, who rule in matters temporal and ecclesiastical, are divided into various orders. The highest is the first presidency, composed of three persons, who are the successors of Peter, James, and John in the Gospel church. Of these, even Brigham Young was eventually excluded from the presidency because of lack of obedience. The second order is that of high priests, composed usually of men advanced in years. Their duty is to officiate in all the offices of the church when there are no higher authorities present. After these come the apostles, who are the overseers of the church chiefly in secular matters; they are pending to the registration of births, deaths, and marriages as part of "literary concerns" (such as newspapers and magazines), house-visiting, and private marriages. The first order is divided into two classes, the Melchisedek and the Aaronic. To the first belong the orders of apostle, seer, patriarch, high-priest, and elder; to the second, those of bishop, priest, teacher, and scribe; these can be held only by "literal descendants of Aaron," who can be pointed out by special revelation.

Doctrine.—The saints are almost incredibly materialistic in their doctrines. Their godhead is formed on Buddhist principles. While professing to believe in the trinity, they explain that God was once a man, who has, however, so advanced in intelligence and power that he may now be called (comparatively speaking) perfect, infinite etc., but that he has still the form and figure of a man; he has even "legs," as is evident (says Mr. Pratt, "the leading scholar of the Mormon church") from his appearance to Abraham, though he has this advantage over his creatures, that "he can move up or down through the air without using them." Christ is the offspring of the "material" union, on the plains of Palestine, of God and the virgin Mary—the latter being duly married after betrothal by the angel Gabriel. Yet he is believed to have had a previous existence, to have even made the universe out of "unformed chaotic matter as old as God," and his worship is enjoined as Lord of all. The Paraclite is vaguely described, but is also material. It would appear, however, that there is an older trinity, that of Elohim, Jehovah, and Michael, which is Adam. Adam, again, is declared to be the "god" of Jesus Christ; Jesus Christ, the god of Joseph Smith; and Joseph Smith is now the god of this generation; but the whole affair is a mass of unintelligible rubbish. The human intellect probably never sank into more abysmal nonsense; all that can be definitely set before the mind is that Mormons believe that by faith, obedience, holiness, any man may rise into a deity, and acquire the power of making, peopling, and ruling a "world" forever! The second article of the Mormon creed affirms that "men will be punished for their own sins, and not for Adam's transgressions;" the third article states that "through the atonement of Christ, all mankind may be saved by obedience to the law and ordinances of the Gospel." The fourth article affirms these "ordinances" to be: 1. Faith
in the Lord Jesus; 2. Repentance; 3. Baptism; 4. Imposition of hands by the gift of the Holy Spirit; 5. The Lord's Supper, administered kneeling. The saints, who are much averse to strong drinks, use water instead of wine in the sacrament, which is taken every week. The fifth article declares that "men must be called to the work of God by inspiration;" the sixth, that the same organization must now exist that existed in the primitive church; the seventh, that miraculous gifts—"discerning of spirits, prophecy, revelations, visions, healing, tongues," etc.—have not ceased. The "discerning of spirits" led Smith, or rather his friends Rigdon, Pratt, etc., who are understood to be the real authors of the metaphysics, into a variety of curious speculations. They believe that the soul of man was not created, but "coexisted equal with God." The eighth article is decidedly liberal; it expresses a belief that the word of God is recorded not only in the Bible and the book of Mormon, but in "all other good books." As for the contradictions that exist in the first, they are admitted, but it is alleged that they are "corruptions," and that they can be removed by any prophet's inspired explanations. On the other hand, the statement that the saints pretend to have a new and inspired translation of the Bible was denied by Brigham Young in a conversation with Dixon (New American, vol. i, pp. 216—217). The ninth article expresses a belief in all that God has revealed, is revealing, or will yet reveal. The tenth affirms the literal gathering of Israel, the restoration of the ten tribes (the "American Indians," who are, in consequence, treated with considerable humanity by the saints; the negro, on the other hand, being excluded from the Mormon church, as a descendant of Cain), the establishment of the new Zion on the western continent—the millennial reign of Christ on earth, and the transformation of earth into a paradise. The eleventh article maintains "the literal resurrection of the body." The twelfth article asserts the absolute liberty of private judgment in matters of religion; the thirteenth declares it the duty of the saints and all others to be "subject to the power that be," whether monarchical or republican. The fourteenth and last is worthy of being universally accepted: "We believe in being honest, true, chaste, temperate, benevolent, virtuous, and upright; and in doing good to all men; also that an idle or lazy person cannot be a Christian, neither have salvation."

The great social peculiarity of the sect is their practice of polygamy. It was not so, however, at first. Rigdon, Kimball, Pratt, Hyde, and Young are its true originators; Emma, wife and widow of the prophet, stoutly denied that her husband ever had any wife but herself. Young's "revelation" she declared to be a fraud, and in consequence withdrew to Nauvoo. Her four sons followed her, and have now founded a monogamic Mormon community, called the Josephites. Another branch of the Mormons (who altogether may number 200,000 souls) has recently settled at Independence, Missouri, the proposed site of the City of Zion. While in the practice of polygamy, it is encouraged on the ground that the rank and dignity of the saints is proportioned to the number of their wives and children. A defense of the practice is also set up on moral grounds, Mormon assert that their community is free of the horrible sin and viciousness that prevail elsewhere; fornication and adultery, with their guilty passions and abandoned conduct, are declared to be unknown; their wives are asserted (Burton and others are very strong on this point) to be happy, virtuous, and healthy and they challenge comparison in regard to their domestic and social purity and felicity with any monogamic community in the world. Dixon (New American, vol. i, p. 243) even sing s a sort of poem on their virtues: "Their streets are clean, their houses bright, their gardens fruitful, Peace reigns in their cities. Tartars and drunkards are unknown among them. They keep open more common schools than any other sect in the United States."

See Book of Mormon (1830); Book of Doctrine and Covenants, consisting of select "revelations" given to Smith (1832); The Pearl of Great Price, also by Smith (first published, Liverpool, 1851); Journal of Discourses, by Brigham Young and others (1854 et seq.); The Exploration and Survey of the Great Salt Lake, by Capt. Stansbury (1849); The Mormons, or Latter-day Saints, by J. L. Kane (1850); The Mormons, or Latter-day Saints, with Memoirs of the Life of Joseph Smith (office of the national illustrated library, London); Voyage au Pays des Mormons, par Jules Remy (1860); The City of the Saints, by R. F. Burton (1861); Dixon's New America (1867); and Busch, Geschichte der Mormonen (Leipzic, 1870).
1879 the secretary of state of the United States addressed a circular to the U. S. ministers abroad directing them to invite the attention of the governments to which they were severally accredited to the laws of the United States against polygamy. This circular also instructed the ministers to inform these governments as to whatever facts might be in their possession, or which they could obtain from consular agents or otherwise, as to the emigration of Mormons from the different countries; and to request the several governments to enforce existing laws against proselytism and the organization of emigration by the Mormon agents and missionaries. Certain of these governments replied to the diplomatic agents of the United States as to these requests, that it was deemed inexpedient and inconvenient to inquire concerning the religion or place of destination of persons leaving their shores. The circular from the secretary of state also expressed the determination of the government of the United States to enforce the law against polygamy contained in section 5595 of the Revised Statutes (the constitutionality of which had been recently sustained by a decision of the supreme court), and to eradicate the institution of Mormonism.

Of the 145,000 people in Utah, about 120,000 are Mormons. But this sect or nation does not alone hold sway in Utah. It has also the balance of power in Idaho and Arizona, and is rapidly populating Washington, Montana, Wyoming, and Colorado. The vote of Idaho, for congressman, at the election of 1880, is alleged to have been carried by an order from George Q. Cannon, directing that all the Mormons in that territory should vote for a certain man whom he named; all the Mormons in Idaho voted accordingly, as a unit. The Mormons are agriculturists, and wherever they go occupy the arable lands, and drive the Indians from the hills for pasture for their stock. The mines are given up to the Gentiles, who become the patrons of the Mormons for their supplies, and the Mormons have endeavored to place such a tax on the proceeds of mining in Utah as should render the business unprofitable, and thus remove the only temptation for Gentile settlement. The nature of the people by whom the Mormon territory is being constantly populated by immigration is of a kind to fall readily under the influence of astute leaders; an influence which is assisted by the ignorance and poverty of the immigrants. These immigrants, assisted in leaving a land where they have been forced to live in abject destitution, or by the most arduous labor for the mere necessities of life, find themselves transported to a country rich in vegetables, meat, fruit, and fish; where, among a people industrious, comfortable, and apparently happy, they are easily induced by the principles under which these conditions have seemingly been wrought out. The result is subordination to the commands of their leaders; and a confiding belief in the promises of the future, which are given them by the command of the president and his subordinates. With the death of Brigham Young, the individual leadership of the Mormons ceased. From a statement recently made by the Mormon "bishop" Henry Lunt, of Cedar City, Utah, to a correspondent of the San Francisco Chronicle, the following summary of the main features of the organization is condensed: First, there is a president, and he has two counselors. Second, there are twelve apostles. The president is one of them, and each receives a salary of $1500 per annum; the president, moreover, exercising an authority equal to that of the other eleven. Third, there are seven presidents designated as the presidents of the seventies, each body consisting of seventy elders, there being eighty of these seventies in Utah, each seventy having seven presidents, and each seven one president. The seventies make annual reports, and all of these officials mentioned constitute the general authorities of the church. Next comes the head patriarch of the church, the dignity being hereditary, by which the candidate is worthy the incumbent residing at Salt Lake City, and being endowed with the power to bless the people by laying on of hands; the present incumbent is John Smith, nephew of prophet Joseph Smith. There is next a presiding bishop who attends to the collection of tithes; the collection from this source being $1,000,000 annually. "Zion" is divided into 23 stakes, each of which has a president, and is divided again into wards, and each ward into districts; the district has a quorum of teachers, whose business it is to visit each family periodically, and look after the spiritual welfare of the members. Each district has a meeting-house, Sunday-school, day-school, young men's mutual improvement society, primary association for small children, and usually a dramatic society. At Cedar City there is a co-operative store, a tannery, and a grist-mill. The church organization ends with the priests and deacons. Out of a total population of about 50,000, there are 20,000 children in Utah under eight years of age. There is a Sunday-school organization known as the Deseret Sunday-school union; there is also a perpetual immigration fund.

As to the possible future of the institution of Mormonism it is proper to quote the following statement of Lunt, setting forth the hopes and designs of the Mormons themselves: "Like a grain of mustard was the truth planted in Zion, and it is destined to spread through all the world. Our church has been organized only fifty years, and yet holds its wealth and power. We look forward with perfect confidence to the day when we will hold the reins of the U. S. government. That is our present temporal aim; after that we expect to control the continent." When the newspaper correspondent, to whom this was said, remarked that such a scheme seemed somewhat visionary, considering the fact that Utah cannot secure recognition as a state, the bishop's reply was: "Do not be deceived; we are looking after that. We do not care for these territorial
officials sent out to govern us. They are nobodies here. We do not recognize them. Neither do we fear any practical interference by congress. We intend to have Utah recognized as a state. To-day we hold the balance of power in Idaho, we rule Utah absolutely, and in a very short time we will hold the balance of power in Arizona and Wyoming. A few months ago president Snow, of St. George, set out with a band of priests for an extensive tour through Colorado, New Mexico, Wyoming, Montana, Idaho, and Arizona to proselyte. We also expect to send missionaries to some parts of Nevada, and we design to plant colonies in Washington territory. In the past six months we have sent more than 3,000 of our people down through the Sevier valley to settle in Arizona, and the movement still progresses. All this will help build up for us a political power which will, in time, compel the homage of the demagogues of the country. Our vote is solid, and will always remain so. It will be thrown where the most good will be accomplished for the church. Then, in some great political crisis, the two parties will petition the church for our support. Utah will then be admitted as a polygamous state, and the other territories we have peacefully subdued will be admitted also. We will then hold the balance of power, and will dictate to the country. In time our principles, which are of sacred origin, will spread throughout the United States. We possess the ability to turn the political scale in any particular community we desire. Our people are obedient. When they are called by the church they promptly obey. They sell their houses, lands, and stock, and remove to any part of the country the church may direct them to. You can imagine the results which wisdom may bring about, with the assistance of a church organization such as ours. It is the completest one the world has ever seen. We have another advantage. We are now and shall always be in favor of woman suffrage. The women of Utah vote, and they never desert the colors of the church in a political contest. They vote for the tried friends of the church; and what they do here they will do everywhere; our principles and our institutions spread.

In the spring of 1873 Brigham Young had a nineteenth and last wife, Ann Eliza Webb, broke away from Mormonism, and returned with the United States delivering lectures against the institution, and particularly its polygamous feature. These lectures produced no small impression. Congress has frequently, in recent years, taken cognizance of the condition of Utah and the institution of Mormonism. In 1873 Mr. Fehrendhysen introduced a bill which severely censured the practice of polygamy among the Mormons, and declared that their wives could claim relief by action for divorce. In 1874 the committee of house of representatives having the matter in charge reported a bill which was still more sweeping in its character, being destructive of all local authority in Utah, and, in fact, placing the territory in the condition of a province, in its relation to the U. S. government. By this bill the control of affairs in Utah was placed in the hands of federal officials, and its practical application would have been to root out the foundation of the system on which Mormonism depended for its existence. During the same year the case of a contest of the election of George Q. Cannon, as delegate from Utah, came up in the house of representatives, and was decided in his favor. But this decision was accompanied by the passage, by a vote of 127 to 51, of a resolution appointing a committee of investigation into the polygamous relation sustained by delegate Cannon, who, it was alleged, was united by the marriage tie of the Mormon church to four wives. Still later in 1874, what was known as the "Utah judiciary bill," passed the house by a vote of 150 to 25, in the face of a resolute and eloquent defense of Mormon institutions by delegate Cannon. This bill was supposed to comprise "a definite and serious attack at the very foundation of Mormonism." Notwithstanding the action taken by congress on these and other similar bills, no important change has been made in the conduct of affairs in Utah, or in the nature and influence of Mormonism, either as to the increase of the number of its adherents by foreign proselyting and immigration, or by any decline in the spread of its tenets and its power in the territories of the United States.

MORMYRIDE, a family of teleostean fishes, allied to the esocidae, or pike family; having longish compressed bodies, and a slender tail, swelling out at the origin of the caudal fin. The skin of the head is naked, enveloping the gill-covers and gill-rays, leaving only a slit for gill-opening. The mouth is small. All the known species inhabit the rivers of Africa. The SHARK-Nosed MORMYRUS (Mormyrus oxyrhynchus) is regarded as one of the best fishes of the Nile. It is caught by lines baited with worms. They are sometimes used as nocturnal fishes. They are sometimes represented on Egyptian monuments, and seem to have been held sacred by the ancient Egyptians. The modern Egyptian name is Mizdah. Some of the species have electric organs.

MORNAY, PHILIPPE DE, Seigneur du Plessis-Mary, 1549-1633; illustrious as a writer and actor during the most direful period of religious intolerance in France. He was son of a Roman Catholic father who destined him for the church, and a Protestant mother who desired to make of him "the most virtuous, and greatest of men." Thoroughly educated in school, and much travel in youth in Italy and Germany, we find him at the age of 22 at Cologne engaged in theological discussions and writings to inspire the low countries to defy the Spanish power. His address to Coligny, then minister of France, designed to secure that minister's influence for William of Orange, was a marvel of literary power. The minister had already

MORMONISM, a system of religious and social doctrines, which originated in the United States during the principal years of the nineteenth century. It is founded upon the Christian principles of the Bible, but it departs from these in a number of striking and important points, and it is therefore necessary to examine these points in detail before we can form a just judgment of the system. The principal points upon which Mormonism differs from Christianity are as follows: 1. The Mormon doctrine of polygamy. 2. The Mormon doctrine of theocracy. 3. The Mormon doctrine of the inspiration of the Bible. 4. The Mormon doctrine of the millennium. 5. The Mormon doctrine of the resurrection of the dead. 6. The Mormon doctrine of the second coming of Jesus Christ. 7. The Mormon doctrine of the eternal progression of the soul. 8. The Mormon doctrine of the immortality of the body. 9. The Mormon doctrine of the power of prayer. 10. The Mormon doctrine of the power of miracles. 11. The Mormon doctrine of the power of fasting. 12. The Mormon doctrine of the power of fasting. 13. The Mormon doctrine of the power of fasting. 14. The Mormon doctrine of the power of fasting. 15. The Mormon doctrine of the power of fasting. 16. The Mormon doctrine of the power of fasting. 17. The Mormon doctrine of the power of fasting. 18. The Mormon doctrine of the power of fasting. 19. The Mormon doctrine of the power of fasting. 20. The Mormon doctrine of the power of fasting.
resolved to send Morny as confidential representative to that prince when the massacre of St. Bartholomew's took place and the young writer barely escaped from Paris with his life. He fled to England, and immediately sought the influence of Elizabeth to avert the further destruction of Protestants in France. He took part with La Noné in an unsuccessful movement of the Huguenots at St. Germain; married an accomplished Protestant lady in 1576, and immediately after joined the army of Condé in France, from which he was called to become a member of the council of Henry of Navarre. By him he was sent to England on a mission; was intercepted by the Spaniards who, ignorant of his mission, permitted him to escape; and finally succeeded in procuring from Elizabeth 80,000 écus for Condé's army. He remained some years in England occupied in strengthening the Protestant cause at the English court, by his writings, and by material aid. In 1584-88 he was member of the two royal political councils of Montauban and La Rochelle, and remained chief counselor of Henry III, until his assassination. He then served Henry IV., and was by him made counselor of state and engaged in delicate negotiations. When the king abjured Protestantism Morny broke with him, and publishing an edict on the resolution of St. Charles, in which he shows the error of the New Testament by the fathers of the church. It brought upon his head a storm of inventive from all sides, but the answers published only served to cause the more universal reading of the heretical tract. Challenged by Du Perron bishop of Evreux, to maintain the truth of some of its statements in open discussion, he accepted, and was caught in a trap carefully prepared to show some of his statements false. This was May 4, 1600. Henry IV, was glad to be sustained in his treachery to old Protestant friends by the apparent defeat of their ablest champion, and Morny was retired from public life until 1617, when he appeared in an assembly of notables at Rouen, and again in 1629 in efforts to bring conciliation between insurgent Huguenots and the government of Louis XIII., and soon after retired to his chateau to die. By the Catholics he was called the pope of the Huguenots. He was controversial writings he was prolific, scholarly, and brilliant.

MORNY. See Convoyulus, ante.

Morny, Charles Auguste Louis Joseph, Comte de, a French statesman, of the second empire, regarding whose parentage the biographical dictionaries published under imperial censorship are strangely silent. It is, however, universally believed that he was the son of queen Hortense and of the comte de Flahaut, and consequently half-brother of Louis Napoleon. He was born in Paris, Oct. 29, 1811. The comte de Morny, a French nobleman resident in Mauritius, received 890,000 francs to adopt him as his son; but he was educated by his "grandmother," Madame de Flahaut, and queen Hortense left him at her death, in 1837, an annuity of 40,000 francs. Morny entered the army in 1832 as a sub-lieutenant, and is said to have shown at this early period a predilection for metaphysics and theology, which is indeed sufficiently surprising, if true, considering his subsequent thirst for material gratifications. He served with some distinction in Algeria; but he soon abandoned a military life, and in 1888 made his début in the world of industry as a manufacturer of beet-root sugar, and published a pamphlet on the subject. Ever after that time, he was mixed up in all sorts of commercial and financial speculations—railway companies, canal companies, French and foreign mining companies, credit societies, industrial enterprises, etc. Chosen a deputy in 1843, he quickly attained a prominent position on account of his aptitude for dealing with financial questions; but events showed that he was not free from the reckless spirit of an adventurer, and his daring at times excited a suspicion of enormous swindling and of the solution of 1852, he became attached to the cause of his half-brother, and was the leader of the sable and treasonable party of the Élysée. He took a prominent part in the coup d'etat. His rôle was to exhibit sangfroid, and to throw the republican leaders off their guard. Nor did he fail of success. He passed the evening of Dec. 1 at the Opéra Comique, and yet, by six o'clock next morning the deed was done, and Morny was minister of the Interior. In 1854 he became president of the Corps Législatif, and was ambassador to Russia during 1856-57, where he married the rich and handsome princess Trubetskoi. The result of this Russian mission was the establishment of intimate political relations between the two governments, and a commercial treaty advantageous to both countries. He died May, 1865.

MOROCCO, or Morocco, called by the natives Maghrib-el-Alsa, "the extreme west," or briefly Maghréb, an empire or suzerain in the n.w. of Africa, is bounded on the e. by Algeria, on the n. and w. by the Mediterranean sea and Atlantic ocean, and on the s. by a line which runs from cape Nun (lat. 23° 45' 43" n.), in an easterly direction through the Sahara to the African frontier in long. 2" east. At the present day, Morocco includes the three provinces of Casablanca, Rabat, and Tangiers, with their dependencies, and the Maghrebian s.w.m., with a population of which the estimates vary from 2,500,000 to 8,600,000. The country is generally mountainous, the Atlas (q.v.) range traversing it in several parallel chains from s.w. to n.e., and sending out numerous spurs to both the coast-country and the desert. There are, however, many level tracts throughout Morocco, especially at its western and eastern extremities, and on the borders of the desert. The central range of the Atlas forms the watershed separating the streams which flow into the Atlantic and Mediterranean from those which run southward to the desert. The former
rivers have the shorter course and less volume, but they are perennial; while the latter become dry in summer, and even when running are lost in the sands of the Sahara. The chief rivers are the Mahaya, with its tributary the Shariet, which drains the n.e. of the country, and falls into the Mediterranean after a course of 400 m; the Kos, Doma- beeg, Bu-Hegreb, Tenslif, Suse, and Assaker, the last forming for part of its course the southern boundary of Morocco, dir. in the central and western districts, and fall into the Atlantic; the Drain, Fileli, Ziz, and Gir, irrigate the dry plains of Tafellet, and the first-mentioned then empties itself into the Atlantic ocean. The subsequent courses of the other three rivers are not yet well ascertained.

The climate between the central range of Atlas and the sea is temperate, the thermometer seldom falling lower than 40° F., or rising above 90° F., owing partly to the regulating influence of the sea breeze, and the shelter afforded by the mountains from the scorching winds of the desert; but in the s.e. districts, extremes of heat and cold are said to prevail, and rain is there unknown. Among the chief edible products are certain are wheat, barley, rice, maize, durra, and sugar-cane; and among fruits, the fig, pomegranate, lemon, orange, and date are common; while cotton, tobacco, hemp, etc., are largely produced both for home use and export. Morocco is supposed to be rich in mineral treasures; plentiful supplies of copper are obtained at Tseleligt, near the source of the Assaker, and gold and silver occur in several places. Iron, antimony, lead, tin, and rock-salt, the last three in considerable quantity, are also found. Owing to the character of the country and its thin population (35 to the English sq.m.), Morocco is much infested with wild animals. Lions, panthers, hyenas, wild boars, and various kinds of deer, gazelles, etc., abound in suitable localities, and occasional devastations are committed by leopards. Ostriches are found in Tafellet. The Moorish horses, formerly so famous, are now much degenerated. The breeding of sheep, oxen, goats, camels, mules, and asses forms an important item of national industry. Oxen and bulls are chiefly employed in field labor.

The population is generally divided into four parts. The first consists of Moors, Berbers, Arabs, Negroes, and Jews, with various intermixtures between these races. More than two-thirds of the population belong to the race commonly called Moors, the remaining third consisting mainly of Berbers or Amazighs (including the Berbers of the Rift coast, and the Sheikhs of the Great Atlas); Jews, estimated at 310,000; and negroes. Very few Europeans reside in Morocco. The state of civilization is very low, and many of the Amazighe are complete savages. Excepting the Jews and the few Europeans, the whole population is Mohammedan. Negroes are brought into the country as slaves from Sudan.

Morocco is divided into four territories—Fez, Morocco, Suse, and Tafellet. For convenience of administration, the empire is subdivided into 33 governments or districts ("amali"), each under the superintendence of a "caid," whose chief duty it is to collect the imposts; but the semi-independent tribes are ruled by their own chiefs, and scarcely acknowledge the authority of the sultan. The government is purely despotic, and in the absence of written laws, the will of the sultan and his subordinates decides everything. The public officials cate out their allowances by practicing extortion on those under their charge, and are in turn plundered by their superiors. The sovereign of Morocco, called by Europeans the emperor of Morocco, is known among his subjects as sultan, and assumes the titles of "emir al-mamlakah," or "prince of the believers," and "khâlit al-Âlal al-fiklîlî," or "viceroy of God upon earth." The title is hereditary in the male line, but does not necessarily descend to the eldest son.

Education consists in learning to read, write, and recite portions of the Koran, and this quantum of education is pretty generally diffused among the people, but the art of printing is unknown, and the arts and sciences are at a very low ebb.

The only industrial arts prosecuted to any considerable extent are the manufactures of caps, fine silks, and leather. In the production of this last, the Moors surpass Europeans, and are able to render any kind of leather extremely soft and white, by the use, it is said, of two species of plants found in the country, and unknown to Europeans. The leather is also excelled in the production of brilliant colors in leather. The yellow leather is made in Morocco and Fez, the green in Tafellet, and red in Fez. There is an important caravan trade between Morocco and Sudan, and also with Mecca and the Levant. The principal exports are wool, hides, grain, cattle and sheep, leather, salt, etc.; and the imports, cotton, linen, and muslin goods, sugar, tea, coffee, hardware, gold dust, indigo, ivory, etc. Mules, horses, and camels form the internal means of transport. Much of the Arabic trade is carried on by coasting vessels between Tangier and Egypt, as the carriage across the desert is very costly. At the present time, two-thirds of the entire trade of Morocco is in the hands of British merchants.

The army consists of between 20,000 and 20,000 men, of whom one-half are negroes; there is also a sort of militia, amounting to 60,000 or 100,000 men, which is occasionally called out. The navy is now insignificant; but in former times, especially in the 16th and 17th centuries, it was very formidable to the maritime powers of Europe, and was chiefly engaged in piratical expeditions. Seeruits.

The history of Morocco is, generally speaking, similar to that of the rest of Barbary (q.v.) down to the end of the 15th century. About that time, it was formed into a monarchy, and, notwithstanding internal divisions, enjoyed considerable prosperity, and
the confines of the empire were extended as far south as Timbuctoo. This empire fell to pieces, and was succeeded in 1647 by that of the sherifs of Tafekett, who conquered both Morocco proper and Fez, and united the whole country under one government. This is the present ruling dynasty. In the middle of the 17th c. the empire of Morocco embraced part of the present province of Algeria, and extended south as far as Guinea, where it came into collision with the Portuguese settlements. Since the commencement of the 19th c. the rebellions of the wild mountain tribes, the disturbances in Algeria, and difficulties with foreign states, caused by the aggressions of the Rif pirates, have greatly retarded the well-conceived measures of the various rulers for the development of the resources and increase in civilization of Morocco. In 1811 the slavery of Christians was abolished; and in 1817 piracy was prohibited throughout Morocco. In 1844 Morocco took part in the war of Abd-el-Kader against the French, in the course of which Tangier was bombarded and Mogadore occupied; but peace was concluded in the same year. In 1851 and 1856 complications took place with France concerning some French vessels which had been plundered by the Rif pirates, but in each case compensation was given by the sultan. In 1859 the Spanish government, smarting under a series of similar outrages, demanded compensation, and also an apology for an insult to the Spanish flag at Cartagena, and on the sultan's declining all responsibility for these acts, war was declared by Spain, Oct. 22, 1859, and a large force under Marshal O'Donnell invaded Morocco. Two battles were fought, several ports were bombarded, and Tetuan taken, and on Mar. 25, 1860, the sultan yielded. A treaty was accordingly signed, April 27, 1860, by which the sultan ceded some portions of his territory, paid 20,000,000 piastres towards the expense of the war, and granted several commercial privileges to Spanish merchants.

MOROCCO (Arab. Marrakedash), the capital of the empire of the same name, is situated in the s.w. of the country, four miles s. of the river Tensift, and at the n. end of an extensive and fertile plain. It is surrounded by a strong line-and-earth wall thirty feet high. The town is ill built, the streets narrow, irregular, and unpaved; the houses generally built of the same materials as the walls, are one story high, with flat roofs, and narrow openings instead of windows. A large portion of the space within the walls is a large miscellaneous trade is carried on. Morocco possesses twenty mosques, of which six are remarkable for their size and elegance. There are several tannery and leather-dyeing establishments, some of them of great extent. The population is estimated at about 60,000.

On the s. of the city, outside the walls, stands a palace of the sultan of Morocco, occupying a space of about 120 acres. Morocco was founded in 1672, and reached the summit of its prosperity in the 13th c., when it contained more than 500,000 inhabitants, since which time it has been rapidly decaying. It is now half in ruins.

MOROCCO LEATHER. See Leather, ante.

MORON, a town of Spain, in the province of Seville, and thirty-seven m. s.e. of the city of that name, on the Guadaira. It is built on irregular acclivities, and contains the remains of a once almost impregnable castle, erected by the Moors on Roman foundations. The inhabitants are engaged in the culture and preparation of olive oil. Pop. 9,000.

MORPETH, a market-town and parliamentary and municipal borough of England, in Northumberland, is situated on the Wansbeck, fifteen miles north of Newcastle. Of the principal buildings, the parish church dates from the 14th c.; the free grammar school of Edward VI., founded in 1552, has an income from endowment of 2690 a year; the town-hall was erected by Sir John Vanbrugh. Flannel is manufactured; brewing, malting, and tanning are carried on, and iron-founderies and corn-mills are in operation. Morpeth returns two members to the house of commons. The pop. of the parliamentary borough in 1871 was 30,239.

MORPHEUS (literally, the "shaper" or "shaper of dreams"). In the classic mythology, the son of Somnus, (Sleep), because he shapes or moulds the dreams that visit the sleeper. He is first mentioned by Ovid, and is represented as an old man with wings, pouring somniferous vapor out of a horn.

MORPHIA (C12H24NO4 + 2 Aq) derives its name from Morpheus, in allusion to its narcotic properties. It is the most important of the alkaloids existing in opium, of which it constitutes from one-eighth to one-sixteenth by weight. It occurs in combination with other alkaloids, and sometimes with sulphuric acid. It is obtained in short rectangular prisms, containing two equivalents of water of crystallization, which are expelled at a gentle heat, when the morphia melts into a resinous substance. Morphia is soluble in about 1,000 parts of cold and in 400 of boiling water; boiling alcohol dissolves it freely, but it is insoluble in ether and chloroform. Its solutions have a bitter taste, and change the yellow color of turmeric paper to brown. Morphia is not so easily detected in cases of poisoning by opium as meconic acid (q.v.). The following are the ordinary tests for it: Concentrated nitric acid, when applied to a crystal either of morphia or of one of its salts, produces an orange color. A mixture of nitric and sulphuric acids colors it green.
When it is mixed with lactic acid, iodate is liberated; which may be recognized by its brown color and by the well-known starch test. A neutral solution of perchloride of iron produces a beautiful blue color.

Morphia is the only opium alkaloid which is soluble in lime-water, and this property affords one of the best means of extracting it. A watery infusion of *O.* *jun* is boiled with milk of lime, filtered, mixed with powdered sal-ammoniac, and again boiled. By this means the lime is converted into the hydrochlorate (or, more correctly, into chlorid of calcium), the ammonia is volatilized by the heat, while the morphia is precipitated in a crude form, which admits of easy purification. Morphia combines with acids to form cry-tallizable salts, which are readily soluble in water and in alcohol. Of these, the hydrochlorate ( morfiate) and the acetate, especially the former, are much used in medicine.

The therapeutic uses of morphia and its salts are very similar to those of opium (q. v.), but the preparations of morphia are preferable to opium and Laudanum in being less liable to occasion nausea and headache. The ordinary dose of morphia, or its hydrochlorate or acetate, when given to an adult to allay pain or induce sleep, ranges from a quarter of a grain to half a grain.

**MORPHOLOGY, Animal.** See Metamorphosis of Animals.

**MORPHY, Paul Charles,** b. New Orleans, 1822; educated at St. Joseph's college. While still a boy he developed remarkable skill in the game of chess, and soon became enthusiastic concerning it, and devoted most of his time to this amusement, which was to him a serious study. He speedily became so proficient as to defeat with ease the players of his native city, and his remarkable skill began to attract general attention among chess-players throughout the country. In 1857 the first chess congress was organized in New York, and Morphy, being specially invited to attend, played daily at the rooms of the congress, which were crowded by persons interested in chess, who were astonished at his remarkable facility in this difficult game. He defeated with ease such players as Paulsen, Piske, Marasche, Lichtenhein, Thompson, Meade, and others, the leading chess amateurs of the country; and in 1859 made his first public exhibition of those astonishing tours de force, blindfold games, as to which he had but one equal competitor, Paulsen, who was, however, a far inferior player before the board. In the same year he visited London, where he played with Löwenthal, winning a majority of games. He attended, at Birmingham, the annual meeting of the British chess association, where he played eight games at once without the board, defeating his opponents in six of them. In Paris he played at the celebrated chess resort, the café de la régence, and defeated the great French players, Rivière, Larche, Dowmand, and Devineck; beat Harwitz five games out of seven, losing one and drawing one; and out of eleven games played with Anderson, the German champion, beat seven and drew two. He remained abroad until the spring of 1859, exhibiting his remarkable powers with and without the board, and on his return to the United States, was admitted to the bar of New Orleans, where he has continued to reside, practicing, however, but little. He greatly injured his health by the strain upon his mental faculties, occasioned chiefly by his blindfold playing, and was forced at last to give up chess altogether, and never quite recovered his mental condition.

**MORRELL, William,** b. England; came to Massachusetts bay with captain Robert Gorges, in 1633. He spent a year in the Plymouth colony, and on his return to England published a Latin and English poem, called Noster Anglo, suggested by his observations in America. It has been republished by the Massachusetts historical society. Little is known of his life, except that he was a clergyman.

**MORRILL, David Lawrence, LL.D.,** 1772-1849, b. N. H.; at first a physician, then a Congregational pastor at Goffstown. In 1807 he resumed the practice of medicine, from which he retired in 1830. He served for a number of years in the New Hampshire legislature, of which he was chosen speaker in 1816 and in 1823 he was president of the state senate. In 1817 he was elected U. S. senator; and on the expiration of his term, was elected governor.

**MORRILL, Justin S.,** b. Vt., 1810; a merchant, and afterwards a farmer. He was a member of congress from Vermont, from 1855 to 1867. During much of this period he was chairman of the ways and means committee, and had an important part in the economical and financial legislation that came before congress. He is the author of the famous Morrill tariff of 1861, and a strong advocate of protection. He was elected U. S. senator in 1867, and has been twice re-elected.

**MORRILL, Lot M.,** b. Me., 1813; graduated at Waterville college (now Colby university); was admitted to the bar in 1839. In 1854 he was elected a member of the Maine legislature; two years later, president of the state senate, and in 1855-60, governor. From 1861-73 he was a U. S. senator, an office he resigned to accept the appointment of secretary of the treasury, June 21, 1876. After serving until the completion of president Grant's administration, he received the appointment of collector of customs at Portland, Me.
MORRIS, a co. in e. central Kansas; 700 sq. m.; pop. '80, 9,266—8,243 of American birth. The surface is level and generally fertile. Most of it is prairie, and in the w. portion there is little or no timber. It is watered by the Osage river, and numerous small tributaries of the Kansas river. Limestone is found in some parts. The principal products are Indian corn, wheat, oats, potatoes, hay, and cattle. It is on the Missouri, Kansas, and Texas railroad. Co. seat, Council Grove.

MORRIS, a co. in n. New Jersey, bounded on the n. by the Pequannock river, on the c. and s. by the Passaic river, and on the n. w. by the Musconetcong; 650 sq. m.; pop. '70, 43,137—34,530 of American birth. The surface is uneven and crossed by a number of ridges, of which one of the highest, Schoolboy's mountain, is a summer resort. A large portion is heavily wooded with hickory, oak, and chestnut. There are a number of iron mines, and zinc, copper, and manganese are found. Marble, limestone, and sandstone abound. The principal agricultural products are Indian corn, wheat, oats, rye, buckwheat, and potatoes. Large numbers of the inhabitants are employed in the iron mines, and in the manufacture of nails, and rolled and forged iron. Among the other articles manufactured are canvas and cotton goods, carriages and wagons, sashes and blinds, paper, and brick. There are a number of four-mills, saw-mills, machine-shops, and distilleries. It is on the Morris and Essex railroad, and the Morris canal. Co. seat, Morristown.

MORRIS, a co. in n.e. Texas, s. of the Sulphur Fork of the Red river. The surface is diversified, and heavily timbered, with oak, hickory, ash, and cypress. The soil is fertile, but not much cultivated. The county has lately been set off, and has not yet become thickly settled. Co. seat, Daingerfield.

MORRIS, a city and the co. seat of Grundy co., Ill., on the n. bank of the Illinois river, and the Illinois and Michigan canal, and on the Chicago, Rock Island, and Pacific railroad; pop. '70, 3,138. It has a high-school, 2 newspapers, 2 national banks, and 7 churches. St. Angela's academy, for the higher instruction of women, is here, a Roman Catholic institution, established in 1857. The city is the center of a considerable trade in grain. There are mines of bituminous coal, and flouring mills. Agricultural implements and furniture are also made.

MORRIS, CHARLES, 1784-1856; b. Conn.; entered the navy in 1799. He was attached to the American squadron in the war with Tripolis, and was made lieut. in 1807. In the war of 1812 he was first lieut. of the Constitution, and was dangerously wounded in the engagement between that frigate and the Guerriere, Aug. 19, 1812. Two years later, in command of the Adams, he cruised along the coast in search of British merchantmen. He was attacked on the Penobscot river by a superior British force, and was obliged to destroy his ship. He continued in the service for the rest of his life, holding various commands. He was successively chief of the bureau of construction, inspector of ordnance, and from 1851 till his death chief of the ordnance bureau.

MORRIS, EDWARD JOY, b. Philadelphia, 1815; educated at Harvard; elected to the Pennsylvania legislature in 1841. He was a member of congress, 1843-45; and again, 1857-61. He was chargé d'affaires at Naples 1859-51, and minister to Turkey 1861-70. He has published a Tour through Turkey, Greece, Egypt, and Arabia Petraea; The Turkish Empire; and some translations.

MORRIS, GEORGE P., 1802-64; b. Penn.; at an early age he became a journalist in New York city, where in 1823 he established The Mirror, a literary weekly that he continued to publish until 1842, when he united with N. P. Willis in publishing The New Mirror a year or more, and then The Evening Mirror. These publications were the representatives of the best literary, dramatic, and artistic interests of the day, having among their contributors Bryant, Halleck, Poe, Paulding, Leggett, Hoffman, and most of the well-known literary men of New York. In 1845 Mr. Morris originated another journal, The National Pres, which eventually became The Home Journal. It is a song-writer, however, that he is chiefly remembered; and among the songs which made his name familiar may be mentioned particularly: Woodman, Spare that Tree, My Mother's Bible, We were Boys Together, and A Long Time Ago. In 1855 he published The Deserved Bride, and other Pieces; and also during the same year he edited, with Mr. Willis, Prize and Poetry of Europe and America. Another of his successes was a drama, Brier Cliff, which was played forty consecutive nights in one of the New York theaters.

MORRIS, GEORGE SYLVESTER, b. Vt. 1840; graduated at Dartmouth college, where he was afterwards tutor. After spending a number of years abroad, in the study of philosophy, he was appointed, in 1870, professor of modern languages, and literature in the university of Michigan. He published a translation of Ueberweg's History of Philosophy, in 1871. His British Thought and Thinkers appeared in 1880. He is now connected with the Johns-Hopkins university at Baltimore.

MORRIS, GEORGE U., 1839-75; b. Mass.; entered the navy in 1846, and was lieut., in command of the Cumberland when she was sunk by the Merrimack, Mar. 8, 1862, on which occasion his cool courage gained great praise. He was made a commander in 1866, and placed on the retired list in 1874.

C. K. X.—15
MORRIS, Gouverneur, 1752-1816; b. N. Y.; educated at Columbia, then known as King's College; studied law, and was admitted to practice in 1771. He was known as a writer of ability while still in his teens; and certain papers by him on finance were highly considered. In 1775 he was sent as a delegate to the provincial congress, and was one of the committee that drafted the constitution for the state of New York. In 1777 he was a member of the continental congress, and of the committee appointed by that body to investigate and report on the condition of Washington's army, then at Valley Forge. He was appointed by Robert Morris, in 1781, assistant superintendent of finance, and held the position for about three years, when he entered into mercantile business. He was sent by Pennsylvania as a delegate to the constitutional convention of 1787, and was appointed one of the committee of five appointed to draft the constitution. In 1791 he was sent by Washington to England on a diplomatic mission; and in the following year was named minister to France, where he remained until 1794, when the French government requested and obtained his recall. In 1800 he was elected to the U. S. senate by the legislature of the state of New York, to fill out an unexpired term. He retired from public life after he had completed the period for which he was elected. He is said to have been an eloquent speaker, and remarkably well informed.

MORRIS, Henry W., 1806-66; b. N. Y.; entered the navy in 1819, and was made capt. in 1856. He was attached to the African, Brazilian, and Mediterranean squadrons successively, and at the beginning of the rebellion was in Washington superintending the construction of the Pea Island. He succeeded in running her by the confederate batteries on the Potomac early in 1862, and reached the federal blockading squadron in the gulf of Mexico. He distinguished himself in the attacks upon forts Jackson and St. Philip at New Orleans, after the capture of which he took the command of the squadron stationed there.

MORRIS, John G., D.D., L.L.D., b. Penn., 1803; educated at Dickinson college and Princeton theological seminary. From 1826 to 1859 he was pastor of Lutheran churches in Baltimore. He catalogued the books in the Peabody institute at Baltimore, of which he was the first librarian, and prepared a list of lepidoptera found in the United States for the Smithsonian institution. He has edited the Lutheran Observer and other periodicals, and has written a number of books: Popular Exposition of the Gospels; The Life of Catherine de Bora; and some translations from the German.

MORRIS, John Thomas, b. India, 1821; studied at Trinity college, Cambridge, where he became a Roman Catholic. He completed his education in the English college at Rome, and was ordained to the priesthood. After passing three years in the diocese of Northampton he returned to Rome, and became vice-rector of the English college. At the end of three years he went back to England, where he was appointed canon residentiary of the London chapter. He also acted as private secretary to cardinal Wiseman, and his successor, cardinal Manning. In 1867 he became a member of the society of Jesus. He was for a time rector of a Jesuit college in Malta, and is now professor of canon law and church history in St. Benedict's college. He has published a Life of St. Thomas of Canterbury; Condition of Catholics under James I.; The Troubles of our Catholic Forefathers, 3 series; The Letter-books of Sir Amelia Penfot; and Cardinal Wiseman's Last Illness.

MORRIS, L. N., 1800-46; b. New York: grandson of Lewis (signer of the declaration of independence); educated at West Point military academy, graduating in 1820. He was occupied in garrison and frontier duty until the war with Mexico, when he went into active service, and distinguished himself at the battles of Resaca de la Palma and Palo Alto. He was killed at Monterey, being, at the time of his death, a brevet maj. and capt. of the 3d regiment, U. S. infantry.

MORRIS, Lewis, 1671-1746; b. N. Y.; son of an officer in the army of Oliver Cromwell, who in 1672, settled where Morrisania now is on a farm of 3,900 acres. He ran away from home when a lad, and visited Virginia and the West Indies. Returning he studied law, and at the age of 21 was a judge of the superior court of New Jersey, a member of the council, and afterward member of the assembly. He became chief-justice of New York and New Jersey; state councilor, 1710-38; acting governor, 1731; and governor of New Jersey in 1735, retaining the office until his death.

MORRIS, Lewis, 1726-98; b. N. Y.; educated at Yale college, where he graduated in 1746. He farmed the family estate at Morrisania, but in 1786 sold it to his brother Gouverneur. He was a member of the provincial congress of 1775; and on the close of the session was dispatched on a mission to gain the adherence of the Indians in the coming struggle. He was again in congress in 1776, and was one of the signers of the declaration of independence. His property was seized by the British, and the family homestead demolished as reprisal for this act. Mr. Morris was a member of the legislature of the state of New York after the organization of the state government.

MORRIS, Lewis O, d. 1864; son of brevet maj. L. N. Morris; was a second lieut. in the U. S. army, and served in the war with Mexico. In 1863 he was in command of a battery stationed in Texas, and on the outbreak of hostilities, though summoned to surrender it to the confederates, refused to do so. In 1862 he was appointed col. of
of the 113th N. Y. volunteers; and shortly after, being stationed at Washington, his command was converted into a heavy artillery regiment, and in the spring of 1864 was attached to the army of the Potomac and participated in all the engagements of the campaign. He commanded a brigade at the battle of Cold Harbor, June 3, 1864, where he was shot at the head of his men.

**MORRIS, Richard, L.L.D., b. England, 1833; educated at St. John's college, Battersea. He became lecturer on the English language and literature in King's college school in 1869, and took holy orders in 1871. Four years later he was made headmaster of the royal masonic institution for boys in 1875. He has written a number of publications for the early English text society, the Chaucer society, and the philological society; and was elected president of the latter in 1874, and is still a member of its council. Besides his editions of early English works, he has published The Etymology of Local Names, 1857; Specimens of Early English, 1867; Historical outlines of English Accidence, 1872; Elementary Lessons in Historical English Grammar, 1874; and Primer of English Grammar, 1875.**

**MORRIS, Robert, 1734-1806; b. in Lancashire, England; received a common school education only; was brought to this country by his father, and when about 15 years old entered the counting-house of Charles Willing, a Philadelphia merchant, and continued in the firm for many years, gradually rising by his industry and ability until, in 1754, he was made a partner. When the revolution broke out he had already acquired a very large fortune, and the firm was second to none in the state in the extent of its business. He at once ardently sided with the patriot party, and by assenting to the non-importation act, 1765, sacrificed great trade advantages for sake of principle. In 1775 he was a delegate to the continental congress, and was a signer of the declaration of independence, though he had opposed its adoption as ill-timed. He served for several years on the committee of ways and means and in that capacity was of immense assistance to the cause not only by his sagacity as a financier, but by his personal credit. More than once he rescued congress from a seemingly fatal crisis by borrowing money on his own name and that of his firm; the $1,500,000 which enabled Washington to carry out his last campaign against Cornwallis was raised by his exertions and on his own notes. From 1781 to 1784 he was superintendent of finance and was vested with complete control over the monetary affairs of the country. Here again he several times used his reputation as a man of great wealth to rescue the treasury from embarrassment. The bank of North America was founded in Dec., 1781, with a capital of $400,000 and was of great use to the government. The looseness of the confederated bond between the states and the general poverty of the people rendered the financial management peculiarly difficult and vexatious; and it was with a sense of relief that, in 1783, Morris resigned his office. Pressed to remain he reluctantly continued his duties until the end of 1784, when a commission was appointed to examine his accounts, and he issued an address, explaining his measures and promising to fulfill all obligations undertaken by him on behalf of the government. In 1786-87 he was influential in procuring the re-establishment of the North American bank; the charter having been repealed. He was a member of the constitutional convention of 1787, and was afterward U. S. senator from Pennsylvania. He was more than once offered the office of secretary of the treasury, but refused and suggested the name of Hamilton. Unfortunately land speculations proved disastrous to his wealth; and on May 7, 1803, the man who had controlled the finances of a rising nation and by his personal exertions saved it from bankruptcy, died in a debtor's prison.**

**MORRIS, Robert Hunter, d. 1764; son of governor Lewis Morris; was chief-justice of New Jersey, and for 26 years a member of the council. In 1754 he was lieutenant-governor of Pennsylvania, and held the office two years.**

**MORRIS, Staats Long, 1728-1800; b. N. Y.; grandson of governor Lewis. He joined the British army, and in 1756 held the rank of capt.; was made lieut. col. of the 89th Highlanders, and was present at the siege of Pondicherry in India in 1761. He was brig. gen. in 1763; married the duchess of Gordon; was a member of parliament; promoted to maj. gen. in 1777, and to gen. in 1786; in 1797 was appointed governor of Quebec.**

**MORRIS, Thomas, 1770-1844, b. Va.; removed in 1800 to Ohio, where he began the practice of law. In 1809 he became an associate justice of the state supreme court. After a service of several terms in both branches of the state legislature, he was elected a member of the U. S. senate. Though a democrat, he did not act with the majority of his party, but was opposed to the extension of slavery, and defended the right of the opponents of slavery to have their petitions considered by congress. His independent attitude estranged his party, and lost him his seat at the next election. In 1844 he was the candidate for vice-president on the "liberty" ticket with James G. Birney. His Life and Writings were published by his son, rev. B. F. Morris, in 1855.**

**MORRIS, Thomas A., D.D., 1794-1874; b. Kanawha co., Va.; was licensed as a preacher of the Methodist Episcopal church in 1814, and joined the Ohio conference in 1816. His itinerant labors were in Ohio, Kentucky, and Tennessee, until 1834, when he was elected editor of the Western Christian Advocate at Cincinnati. In 1836 he was elected bishop. Ill health for several years before his death had withdrawn him from
active duty. He published sketches of Western Methodism and some sermons. He was distinguished for excellent judgment, and made an able presiding officer.

MORRIS, William, one of the most powerful of contemporary English poets, was b. near London in 1854, and educated as a painter. In 1863 he associated himself with some others to found an establishment for designing and manufacturing decorative furniture, wall paper, stained glass of the like, and has actively engaged in this business. His chief poems are The Defense of Guenevere (1858), Atten (1854), The Earthly Paradise (1850), Love is Enough (1853), a translation of Virgil's Aeneid, and Sigurd the Volsung (1877). He has also published translations from the Icelandic.

MORRIS, William Walton, 1801-67; b. N. Y.; educated at West Point. He served, with distinction, through the Seminole war, and was with Gen. Taylor in the Mexican war. He was at Palo Alto and Resaca de la Palma, and was commissioned temporary governor of Puebla, in 1847. He was stationed at fort Kearney, Nebraska, 1853, and was in command of fort McHenry, Baltimore, during the rebellion. He was brevetted major, gen. the day before his death.

MORRISANIA, a village of New York, in Westchester co., on the New York and New Haven Railway, and about 10 m. n. of New York. It has been mostly built within the last twenty years, and is chiefly occupied by persons doing business in New York. Pop. 70, 19,969.

MORRISANIA (ante), was annexed to N. Y. co, in 1874. It is a station on the New York and Harlem Railroad, and connected with New York by an iron draw-bridge. It contains numerous schools and an academy, 20 churches, a convent, and many fine residences. It has a rapid growth.

MORRIS-DANCE, a fantastic dance, commonly practiced in the middle ages, and not yet wholly forgotten in England. Its origin is ascribed to the Moors. The chief performer was the hobby-horse, so called from the light frame of wickerwork which was fastened round his body, and supplied with a pasteboard head and neck, so as to give him the appearance of a man on horseback. Bells were also attached to his ankles, and the great art consisted in so moving the feet as to produce a rude kind of concord. The other principal actors, after a rude fashion, personified the characters of Maid Marian, the Queen of the May, Robin Hood, Friar Tuck, the Fool, etc; and the performance was accompanied by rude music, and the clashing of swords and staves, and was the chief amusement at parochial festivals.

MORRIS ISLAND, situated at the entrance to the harbor of Charleston, S. C., 9¼ m. long. It was connected with the very first overt act in the war of the rebellion, a battery at Cumming's Point, the northern end of the island, being concerned in the capture of fort Sumter, April 12-13, 1861. It was made one of the line of defenses of Charleston, fort Wagner and other batteries being erected upon it, and proved to be of great importance to the confederates. Early in July, 1863, the union forces made a descent on the s. extremity of the island and effected a landing; but the efforts immediately made to capture fort Wagner proved unsuccessful. It having been concluded to reduce this important work by regular siege, parallels were opened and approaches made, beginning July 9, with the first parallel. Five parallels were established between that date and Aug. 20; and, with the assistance of 6000 men, it opened on Sept. 3, under cover of which the approaches were pushed forward, and on Sept. 6 the fort was evacuated. The island was now employed in the siege of Charleston by the union forces, by placing powerful ordinance of long range on the n. end of the island, and using these effectually to throw projectiles into the city, 4 m. distant.

MORRISON, a co., in central Minnesota, bounded on the w. by the Mississippi river, on the n. by the Crow Wing river, drained by the Platte and Swan rivers and other streams; 1175 sq. m.; pop. 70, 1801-1113 of American birth. The surface is largely prairie, with a heavy growth of timber. The soil is rich, and produces large crops of Indian corn, wheat, oats, grass, and potatoes. Co. seat, Little Falls.

MORRISON, a t. in Illinois, on the Chicago and Northwestern railroad; pop. 70, 2,500. It is pleasantly located on Rock creek, and is the seat of Whiteside co., 124 m. from Chicago and 14 m. of Clinton, Iowa. It contains a court-house, 7 churches, a national bank, and 2 weekly newspapers, and derives its importance mainly from the rich agricultural and stock-raising country surrounding it. The leading industries are the manufacture of carriages, wagons, and agricultural implements.

MORRISON, Robert, D.D., the founder of Protestant missions in China, was b. of Scottish parentage at Morpeth, in Northumberland, Jan. 3, 1782. He studied at one of the independent colleges, and 1805 he was sent to Macao and Canton by the London missionary society, to learn the Chinese language, and to translate the Bible into it. He reached Canton in September, 1807, and in the course of a year was appointed translator to the East India company's factory at Canton. By the year 1814 he had completed the translation and printing of the whole of the New Testament. Four years later, by the help of Mr. (afterwards Dr.) Milne, he had done the same with the Old Testament; and in 1822 he completed and printed his great Chinese Dictionary at an expense to the East India company of £15,000. In 1816 he acted as interpreter to Lord Amherst. In 1818
he established an Anglo-Chinese college at Malacca for English and Chinese literature, and for the propagation of Christianity. After a residence of 17 years in China, he returned to England in 1824, and brought with him a collection of 10,000 books in the Chinese tongue. In 1826 he returned to China. In 1834 he accompanied Lord Napier to Canton as interpreter, and died there Aug. 1. Besides the works already mentioned, he is author of *Horse Sinicis* (Loud. 1812), being translations from the popular literature of the Chinese; a *Chinese Grammar* (Scrammure, 1815), and *Chinese Miscellany* (1825). In 1839 his widow published *Memoirs of the Life and Labors of Robert Morrison*.

MORRISON, WILLIAM, 1785-1866, b. Canada; was apprenticed to the New York fur company in 1802, and was afterwards admitted as a partner. During the twelve years of his service with the company, he explored a large part of Wisconsin and the northwest, and he is said to have been the first white man to find the source of the Mississippi. From 1815 to 1826 he managed the fur business of John Jacob Astor.

MORRISTOWN, a village of New Jersey, on the Whippany river, and the Morris and Essex railway, 23 m. w. of New York, on an elevated plain, commanding a fine prospect. It has a court-house, 2 banks, 8 churches, and several literary institutions. Pop. 70, 5,674.

MORRISTOWN (state), a t., the capital of Morris co., N. J., on the Morris and Essex division of the Del., Lack., and Western railroad, 32 m. w. by n. of New York. It was the principal E. point of the state during the war of 1776-77 and 1779-80. The traces of an old fort still exist back of the court-house, and the house occupied by Washington, having long remained in the ownership of the Ford family, is now the property of the state, and has been made a depository for many interesting revolutionary relics. The town is built on a plateau which affords beautiful views of the surrounding valleys and hills. As originally laid out there was a common in the center that was called "the green," from which in process of time the grass disappeared. After many fruitless efforts to improve it, a satirical effusion, calling it "an invisible green," led to its being inclosed and adorned. It now contains a monument to the memory of the soldiers who gave their lives to the defense of the union. The town and its environs furnish pleasant summer residences for citizens of New York, and homes for many whose business affairs call them to that city every day. Among the public buildings are the Court house, a public library and lecture rooms, and churches of different denominations, two of them Presbyterian, the first of which is venerable among the older churches of the land, and the second admirable in the beauty of its modern architecture. In the vicinity is the new state asylum for the insane, having one of the largest and best arranged buildings in the country. Its entire length is 1243 ft., and its greatest depth, from the front of the main center to the rear of the extreme wings, 543 ft. It is built in an ornamental style of architecture, principally of light granite quarried on the spot. It has accommodations for 1000 patients, and its grounds contain more than 400 acres. Its cost was more than two millions of dollars.

MORRISTOWN, a village in e. Tennessee, a junction of the East Tennessee, Virginia, and Georgia railroad, and the Cincinnati, Cumberland Gap, and Charleston; pop. 70, 1000. It is situated on the s. bank of the Holston river, and is the seat of 2 colleges, a female institute. It has public schools, 6 churches, a national bank, 2 weekly newspapers, and 3 hotels. It is in the center of a fertile agricultural district, which contains extensive quarries of variegated marble. The leading industries are the manufacture of flour, and of sashes, doors, and blinds.

MORROW, a co., in central Ohio; 400 sq. m.; pop. '80, 19,073—18,461 of American birth. The surface is undulating, and the soil fertile, producing good crops of Indian corn, oats, wheat, and flax. Other staples are wool and maple-sugar. Much of the surface is covered with forests, and there is an abundance of sugar-maple trees. There are freestone and sandstone quarries. Vernon river, Walnut creek, and the e. fork of the Whipstone river flow through it. It is on the Cleveland, Columbus, Cincinnati, and Indianapolis railroad. Co. seat, Mount Gilead.

MORROW, JEREMIAH, 1771-1862, b. Penn.; settled in the northwest territory in 1805. He was a member of the convention in 1802 which framed a constitution for the new state of Ohio. He represented that state in the lower house of congress 1802-13, and in the senate 1815-19. He was elected governor in 1822, and served till 1826. Soon afterwards he became commissioner of canals; and 1841-43 he was again in congress.

MORS, the largest island in the Lymford, s. of Jutland, in the kingdom of Denmark, 24 m. long; 11 m. broad; pop. 6,000. About two-thirds of the surface is a high table-land, with fertile soil; the remainder comprises bogs and marshes. The chief town is Nyecklobing, on the e. coast of the island.

MORSE, EDWARD SYLVESTER, Ph.D., b. Me., 1838; educated at the Lawrence scientific school of Harvard university. In 1859 he became an officer of the Cambridge museum of comparative zoology, and in 1867 he was elected by the Boston society of natural history its curator of mollusca. He has been professor of comparative anatomy and zoology at Bowdoin college, and lecturer on zoology at Harvard. He is an officer of the Peabody academy at Salem, Mass., where he resides. He has written many
papers, and delivered lectures on scientific subjects, and has published An Elementary Text Book of Zoology.

MORSE, JEDIDIAH, D.D., 1761-1836; b. Conn.; graduated at Yale college in 1783; in 1784 published at New Haven a small geography, which was followed by a series of geographies and gazetteers of the United States from materials collected by traveling and correspondence with J. Belknap, historian of New Hampshire, and others. These works were very popular and had a large circulation. They were published in England, and translated into French and German; and engaged with his brother in 1785, was tutor in Yale in 1786; pastor of the First Church (Congregational) in Charlestown, Mass., 1789-1820. At the close of his pastorate, having received a commission from Mr. Calhoun, secretary of war, he spent two winters in visiting some Indian tribes, of which a report was published in 1822. He was editor of the Panoplist 1806-11, and one of the founders of Andover theological seminary. He published, besides his geographies, A Compendious History of New England; Annals of the American Revolution; An Appeal to the Public on the Controversy respecting the Revolution in Harvard College; and several sermons and addresses. In 1794 he received the degree of D.D. from Edinburgh. Dr. Morse, who was eminent in the New England ministry, was much engaged in religious controversy, maintaining the old evangelical faith in New England against the Unitarians.

MORSE, RICHARD CARY, 1795-1868; son of Jedidiah; b. Charlestown, Mass.; studied at Phillips academy, Andover, and graduated at Yale college in 1812. After graduating, he spent a year in New Haven as an amanuensis in the family of president Dwight; studied theology at Andover seminary; entered the ministry in 1817. Convinced that he was not fitted for the parish, the fact was established by the testimony of his predecessor in his geography; in 1823 he united with his brother Sidney in establishing the New York Observer, of which he was associate editor and proprietor during the remainder of his life. He wrote largely for its columns, especially translations from French and German. In 1858 he retired from active life. He died while abroad at Kissingen, Germany.

MORSE, SAMUEL FINLEY BREESE, LL.D., etc., American artist and inventor, was the eldest son of rev. Jedidiah Morse, D.D., geographer, and was b. at Charlestown, Mass., April 27, 1791. He graduated at Yale college in 1810, and visited England with the American painter, Washington Allston, to study painting with him and Benjamin West. In 1813 he received the gold medal of the Adelphi society of arts for his first effort in sculpture, the "Dying Heracles." Returning to New York in 1815, he became the first president of the national academy of design, and was appointed professor of the arts of design in the university of the city of New York. He did not give his entire attention to art, but was interested in chemistry, especially in electrical and galvanic experiments; and on a voyage from Havre to New York, in 1823, he conceived the idea of a magnetic telegraph, which he exhibited to congress in 1837, and vainly attempted to patent in England. His claims to priority of invention over prof. Wheatstone in England have been the subject of considerable controversy. See TELEGRAPH. He struggled on with scanty means until 1843, when, as he had almost yielded to despair, congress, at midnight, and the last moments of the session, appropriated 39,000 dollars for an experimental line between Washington and Baltimore. For his telegraphic inventions, Morse was rewarded by testimonials, honors, orders of nobility, and wealth. Several European states joined in presenting him a purse of 400,000 francs, and banquet were given him in London and Paris. The well-known recording instrument is his invention. The origination of submarine telegraphy is also claimed for Morse. He died April 2, 1872.
Morse.

equalled in the case of any other American. He received gold medals from Prussia, Austria, and Wiirtemberg. France conferred upon him, through the emperor Napoleon, the cross of the chevalier of the legion of honor; Denmark made him knight commander of the first class of the Dannebrog, and Spain, knight commander of the order of Isabella the Catholic; from Italy he received the cross of the order of Saints Maurice and Lazarus, and from Portugal that of the order of the tower and the sword. Turkey bestowed upon him, at the hands of the Sultan, the decoration of the "Mysban ikhtiar," and Yale college conferred upon him in 1845, the degree of LL.D. Public banquets were given him in London, Paris, and New York, and in June, 1871, a bronze statue of him was unveiled in Central Park.

Prof. Morse set up the first daguerreotype apparatus, and took the first daguerreotypes in America; he also laid the first submarine telegraph line (in New York harbor, in 1842); and from him, in a letter to the secretary of the treasury of the United States in 1843, seems to have come the first suggestion of an Atlantic telegraph. His death occurred about three months after his last public act—the unveiling of the statue of Benjamin Franklin, in Printing-house square, New York.

MORSE, SIDNEY EDWARDS, son of Jedidiah; 1794-1871; b. Charlestown, Mass.; graduated at Yale college in 1811; studied law in Judge Reeve's school at Litchfield, Conn.; established in 1815 the Boston Recorder, a weekly religious newspaper, and was for fifteen months its sole editor and proprietor. In 1817, in connection with his brother, he invented and patented the flexible piston pump. In 1820 he published a small geography, and in 1832 a larger one which was a text-book in several American colleges. In 1823 he united with his brother, Richard C., in establishing the New York Observer, now the oldest religious newspaper in the state. In 1839, jointly with Henry A. Munson, he printed and patented a machine which he called cerography. The first application of the art was in the preparation of maps for a school geography written by himself, of which 100,000 copies were printed and sold the first year. The process of cerography has not been disclosed. He continued the senior editor and proprietor of the Observer until 1858, when he disposed of his interest to the Rev. Dr. S. I. Prime, for many years his associate. Much of his time during the last years of his life was devoted to the invention of the cathometer, for deep-sea soundings, and he was preparing an essay on the subject at the time of his death.

MORSE, WALRUS, OF SEA-HORSE (trichechus), a genus of amphibious mammalia of the family phacelid, agreeing with the rest of that family—the seal—in the general form of the body and limbs, but widely differing from them all in the head, which is remarkable for the enormous development of the canine teeth of the upper jaw, and the tumultuous appearance of the muzzle caused by the magnitude of their sockets, and by the thickness of the upper lip. These great canine teeth form two tusks directed downwards, and the lower jaw becomes narrow in front, so as to pass between them. There are no canine teeth in the lower jaw. The incisive teeth are small, six in the upper jaw, and four in the lower, mostly disappearing from adult animals. The molaris—at first, five on each side in each jaw, but fewer in the adult—are simple and not large; they have the crowns obliquely worn. The nostrils, as displaced by the sockets of the tusks, open almost upwards, at some distance from the muzzle. The noses are small, and the ears have no aurich or; in popular language, there is no ear. There is only one known species (T. rosivarm), sometimes called the Arctic Walrus, an inhabitant of the Arctic seas and of the colder parts of the north temperate zone. It sometimes attains a size greater than that of the largest ox, and the tusks are sometimes 2 ft., or even 30 in. long; but the ordinary length of the tusks is only about one foot. The morse is a gregarious animal, and is often seen in great herds, which sometimes leave the water to rest for a while either on the ice or on the land, where, however, their movements are very awkward and clumsy, and the hunter assails them with much greater prospect of success than in the water. Hundreds have thus been killed at one time, although the adventure is not without danger, as they must be assailed with spears, their hide being thick enough to resist even a rifle bullet. The morse uses its tusks for protecting itself or young from attack, for combating with its enemy the polar-bear, for aiding it in climbing upon ice; but principally, it is supposed, for tearing sea-wood from submarine rocks; that being, there is every reason to think, the principal food of the animal, although it is supposed also to prey on mollusks, crustaceans, and other marine animals. The female morse shows great affection for her young, and will defend it to the last extremity; the young also remains beside the mother even after she is killed. When one of these animals is attacked, the rest of the herd—at least if in the water—hasten to its assistance. The morse is very capable of being tamed.—It is much sought after by the inhabitants of the most northern parts of the world for its skin, thongs of which seem to have been generally used in former times for ropes and cables—esteemed so valuable, that the Finlanders paid tribute in this article; whilst its oil—not very abundant—is employed like seal oil; and the tusks are very much valued as ivory, being superior in compactness to those of the elephant. The flesh is coarse, but is eaten by the Esquimaux. The young morse has not large tusks like the adult.

The morse has occasionally been seen on the British coasts, probably transported on icebergs from the north.
The name Morse is from the Russian mors or Lapp morsk. The name velus is Norwegian (heal-ror, whale-horse). Another Norwegian name is rosmor, supposed to be from the Tventonic ros, horse, and mor, the sea.

Morshansk, t. in the government of Tambow in Russia, 56 m. n. of Tambow, is situated on a feeder of the Oka. Pop. 70, 19,800. Morshansk is the port for shipment of corn, the shipments annually amounting in value to 5,000,000 rubles. There is also a large market for the cattle and sheep of the s.e. provinces, the average annual supply being 20,000 cattle and 100,000 sheep; also for melted grease, of which 1,500,000 rubles' worth is sent yearly to St. Peters burg and Moscow. The trade of the town itself is of little importance, the chief establishments being soap bo ileries, flour mills, and sail-cloth manufactories.

MORTALITY, LAW OF. While there are few future events the date of whose arrival is more uncertain than that of death to any one man, on the other hand, the average duration of a multitude of human lives is found to be in accordance with a law which operates as surely as that of gravitation. If it be asked how many lives must we have before we can depend on obtaining from them a duration equal to the general average, the only answer that can be given is, that the more we have the more nearly must we approach to this result; the fluctuation ultimately becoming so small as to be practically of no effect. So long ago as early in the 17th c., a certain John Graunt of London published what he called Natural and Political Observations on the Bills of Mortality. This work has been called "the earliest movement in economical arithmetic, and the closest approach of science to data that relate to the_price_of_life_ assurance as founded upon them." About the same time, the sir William Petty gave to the world many curious calculations and speculations on the subject. In 1693 Dr. Halley published the Breslaw tables of mortality, and this was the first work which really raised the subject to the rank of a science. Halley's speculations had, however, been preceded by those of Pascal in France, and of De Wit in Holland; and the latter famous man is probably entitled to be considered as the first who has applied the doctrine of probabilities to the valuation of life in the question of annuities. His treatise will be found in the second volume of the Assurance Magazine. Halley's tables are printed in the Philosophical Transactions for 1693, No. 196. In 1713 J. Bernoulli's important work was published; and in 1742 Dr. Price, availing himself of the principles laid down by Halley, and of data previously published by "John Smart of Guildhall, London, gent.," gave tables of mortality for London. In 1746 M. Deparcieux published at Paris his Essai sur les Probabilités de la Vie Humaine, in which he gave tables calculated for a number of years. Instead of these, computed from the registers of different religious houses, it was shown, for the first time, that in 1770 appeared the first edition of Price's Observations on Reversionary Payments. The speculations of Buffon, Simpson, and De Moivre about the same time were of much importance. Mortality tables are tables showing the operation of the law of mortality. The correct method of framing them is by analyzing and collating accurate and sufficiently extensive statistics of life and death. They enable us to form a fair estimate of the number of human beings who will die at the end of a given period after a given number alive at the beginning of it; and hence, the chance of life and death to the individual, and the mean duration of life at any age. Tables showing the mean duration of life have been constructed in two ways: 1st, From statistics of deaths alone; and 2d, From statistics of life and death. By the first plan, they would be deduced as follows: Suppose, on searching a parish register, that we found recorded 100 deaths of children in their first year, we should assume that, on an average, a year of life would have fallen to each. This gives 50 years of life for 100. If we found that 60 had lasted their second year, assigning one year and a half to each, we should have 60 x 1.5 = 90 years among the 60; and so on for every age up to the oldest on the register. The sum of all the years enjoyed, divided by the numbers who have enjoyed them, will give the mean duration of life from birth; and the sum of all the years enjoyed after a given age, divided by the numbers who have enjoyed them, will give the mean duration at that age; in both cases as nearly as the data enable us to give it; but the data are insufficient. Suppose we found by a register for 1873 that 100 children had died in their first year and one man in his 96th, it is plain that, to make this ratio a fair one, there ought to have been as many births in 1778 as in 1873. If there have been only half as many born at the former date as at the latter, then we must put two lives into the calculation to make it correct; and we must proportion our results similarly at all intermediate ages. Again, suppose four deaths at age 29 to be registered, we cannot tell how many of those born in 1850 may have migrated from one parish, or do we know how many have died elsewhere in the very year we have come into it. For the rule and formula for obtaining the mean duration of life under the second method, which is an absolutely certain one, see Life, Mean Duration of. The following are the tables now most generally used by assurance and annuity offices in this country: 1. The Northampton (Dr. Price's). This table was framed by Dr. Price from the register of burials in the parish of All Saints, Northampton, 1755-80. Being constructed on deaths alone, it has, as was to be expected, proved faulty. It gives the probabilities of life too low at the younger and middle ages; and those offices which still use it—and there are a good many—have some difficulty in keeping themselves right. 11. The New North-
ampton (Nos. 1 and 9). These tables were constructed by Dr. Farr. See Eighth Report of the Registrar-General for England, pp. 277-318. No. 2 is based on the deaths alone in Northampton during the seven years 1838-44. In its results it agrees almost exactly with that of Dr. Price. No. 1 was deduced from a comparison of the deaths during 1838-44 with the census returns of 1841. It differs widely from No. 2 and from Dr. Price. By the two latter, the mean duration of life is respectively found as 24.88 years and 25.18 years. By No. 1 it is 37.5 years. III. The Carlisle. This table was constructed from observations made by Dr. Heysham at Carlisle, 1789-87. It is now generally understood that the mortality in towns is understated at ages 15-55, owing to the immigration of healthy men and women from the country. Again, the female population of Carlisle was excessive during the period in question, and the extent of the observations was limited. Owing to these facts, this table gives rather too low a rate of mortality, and is a little irregular in its graduation. In a table prepared by W. T. Thomson, esq., in a Report on the Ministers' Widows' Fund of the Church of Scotland, 1861, he shows that the lives of the Scotch clergy are about half a year better up to 44 than the Carlisle; at 45, they are equal; and at 45 to 80 they are half a year worse. Thereafter they vary. The widows are half a year better up to 61, equal at 62, and nearly so to the end. Probably the Carlisle gives a fair mortality rate for a healthily circumstanced population. IV. The Government. These were computed by Mr. Finlayson on the lives of 32,000 nominees for government annuities. They are chiefly important as giving a view of the value of female life, but this view is one which differs widely from those given either by the "Experience" or by the "English" table. At age 20, for instance, the mean duration of female life is, by the Government table, 51 years more than the male by the experience, it is 4 years less. In some measure this divergence may perhaps be accounted for by the fact that the Government results are deduced from annuities, the Experience from assured lives. The experience of late years has, however, led to some modification in the relative values of male and female life in government tables. V. The English (Nos. 1, 2, and 3). No. 1 is deduced from the living by the census of 1841, and from the deaths at corresponding ages in the same year. See 5th and 6th Reports of the Registrar-General for England, where the tables will be found, and their construction explained. No. 2 is deduced from the living in 1841, and from the deaths in the seven years 1838-44. No. 3 is deduced from the population in 1841 and in 1851, and on the deaths for the 17 years 1838-54; male and female life being calculated separately and in combination. These "English" tables probably give the results of the average mortality of England more correctly than any others which we have. The London table on the lives of male and female, which Dr. Farr in his Report on the Medical Statistics of England for 1872, as well as in his report on the lives of Scotch men and women, was taken on the plan recommended by prof. de Morgan and Mr Griffith Davies. VI. The Experience. These were prepared by a committee of eminent actuaries on the data afforded by the combined experience of 17 life assurance offices. The objections to which they are liable are, that certain lives, having been more than once assured, have appeared twice or oftener as elements in the calculations; that the average term over which the observation of the offices extends is only eight and a half years; and it is probable that the mortality which will prevail in assurance societies when they have reached maturity is somewhat understated. See letter by Dr. Farr in Appendix to 10th Report of Registrar-General, p. 11. Further, the data for old ages were deficient, and this of course affects the whole. Many curious results are brought out by this table. It shows that "town" assured life is superior to "country," that female assured life is on the whole inferior to male, and that Scotch life is worse of all. At age 29 it is 29 years, and at age 40 it is 40 years, and at age 50 it is 50 years, and at age 60 it is 60 years. The average duration is 41 years, 2 months; country, 40 years, 4 months; Irish, 34 years, 11 months. The observations of the Standard assurance company do not, however, bear out these results; and they are doubtless so largely affected by the elements of cæse in selection as to render it impossible to found on them any conclusion of practical value. A new set of "Experience" tables was published in 1872, based on the mortality experiences of twenty offices, ten English and ten Scotch. They do not show any widely different results from the former Experience tables. These form a very valuable set of tables. They give the results of English and Scotch experience united, and of Scotch separately.

In all tables deduced from the experience of assurance and annuity societies, the fact of these tables must not be lost sight of, either in using them for the sake of comparison, or as the basis of other tables. Actuaries, however, seem to be generally of opinion, that the selection exercised by assurance societies does not really lower their rates of mortality below the general average; without selection, their rate would be above the general mean; for, it will be observed, that the public are continually selecting against the offices by offering inferior lives, and good lives often surrender their policies, while lives which have become bad hardly ever do so. Again, the value of medical examination gradually disappears, and in ten years at most it is quite lost. Five to seven years is indeed now held by the assurance offices to exhaust its value. See Minutes of the House of Commons' Committee on Assurance Associations, 1858; and Life-Contingency Tables by E. J. Farrea, pp. iii.-xiii. Though female life is, as a whole, undoubtedly superior to male, yet as there are more critical periods in it, it is probable that the public may more frequently select it than male life against the societies. A valuable report on the Madras military fund (London, 1863) gives tables constructed on the mortality rates pre-
vailing among the officers, wives, and widows interested in the fund. As they have been prepared by eminent men on very ample data, they will probably be very valuable to societies transacting business in India. The following is a view of the mean duration of life, at the beginning and at each decennial period, according to some of the tables mentioned above:

In the present article we have considered the law of mortality chiefly as it bears on insurance and other monetary transactions. The wider view of the subject, as varying with occupation and in different ages and countries, will be illustrated under the head of Vital Statistics.

MORTAR. See CEMENTS.

MORTAR, a piece of artillery which differs from a cannon in the large diameter of its bore in proportion to its length, and in the circumstance that it is usually fired at a considerable angle, so that the projectile may strike the object aimed at in a direction more or less vertical. The object for which mortars are intended is the discharge of live shells (q.v.) or carcasses. As the projectile has a large diameter, and, except in rare instances, a very great range is unnecessary, a comparatively small charge of powder is requisite. To give this its utmost power and concentration, it is confined in a hemispherical chamber at the lower end of the bore, but of less diameter. The shell completely closes this chamber; and when the explosion ensues receives its full force on its center. In the British service the ordinary mortars range in diameter of bore from 5 to 13 inches.

Larger mortars have, however, been tried at times, as at the siege of Antwerp cited in 1832, when the French brought one of 24 inches bore to the attack. This monster, owing to its unwieldiness and other causes, was a failure. Larger still than this, though perhaps more manageable, is Mr. Mallet's great 36-inch mortar, constructed in 1853, of iron parts welded together, and now at Woodbridge, rather as a curiosity than for use. As loaded shells are of immense weight, so heavy, indeed, as in larger calibers to involve the apparatus to deposit them in their places, and the mortar is fired at high elevations, the recoil is so great and so nearly vertical that no carriage could withstand the shock; it is necessary, therefore, that the mortar should be mounted on a solid iron or timber bed, by the trunnions, which are placed behind the breech, and supported in front by massive blocks of wood. This arrangement renders the apparatus so heavy that mortars of large size are rarely used in field operations, their ordinary positions being in defensive or siege works, and in mortar-vessels.

More widely, however, are the Coehorn mortars, invented by the Dutch engineer of that name, for clearing the covert-way or ditch of a fortress. This mortar is sufficiently small to be managed by one man, and is accounted useful in siege or defense operations. The French use a similar Lithuanian ordnance under the denomination of pietrots, or stone-throwers. Small mortars are likewise constructed for mountain warfare; a mule carries the mortar, another the bed, and a third is laden with the projectiles. The use of mortars is diminishing at the present time, elongated shells of great weight being now thrown from rifled cannon.

MORTARA, a t. in n. Italy, 25 m. n.e. of Alessandria, and about 40 m. n.w. from the city of Pavia. It is in a fertile agricultural district, in the province of Pavia, on the Arbogina, and until recently was surrounded by fortifications and high walls, which have been removed and their place occupied by elegant villas; pop. 74, 740. It is the center of a number of railways and highways which give it some commercial consequence, and it contains military barracks, a theater, and good public schools. From the rice-fields in the vicinity there rises an unwholesome exhalation said to make the atmosphere unhealthy. In 774, when Charlemagne, having invaded Italy, besieged Pavia for eight
months, the expedition resulting in the capture of Desiderius, one of the Lombards, and the downfall of their government, this city was the scene of a bloody battle, and was conquered only when its defenders were disabled by pestilence and famine.

**Mortara, Edgar**, a Jewish boy, whose case recently attracted great and painful interest throughout Europe. The facts are as follows: On June 23, 1858, signor Monnoio Mortara, a manufacturer and wholesale merchant of cloth in Bologna, and by religious profession a Jew, returning home about ten o'clock at night, found his house in the possession of the police, who informed him that they had orders from padre Felletti, inquisitor-in-chief at Bologna, to carry off his son, Edgar, who had been surreptitiously baptized into Christianity by a Roman Catholic maid-servant. The inquisitor was waited upon by some friends of the family a little after midnight, who implored delay. He informed them that he was acting under the orders of the archbishop of Bologna, but consented to sift the procedure till "next evening." The archbishop, however, was "absent" in the city, and next evening the papal cabalists entered the house, and tore the child out of his father's arms. They carried him to Rome, where he was imured in a convent. The bereaved father immediately followed, obtained several interviews with cardinal Antonelli, and offered to prove that the servant who said she had baptized Edgar had turned out to be a worthless prostitute, living in sin with Austrian officers. The cardinal declined to interfere, on the ground that the case did not come under his jurisdiction, and recommended signor Mortara to apply to "the proper tribunals." After some weeks had passed, the child was removed to Alatri, whither his father and mother also went, and saw Edgar in a church among a number of priests, but had no opportunity of speaking to him. They returned to Rome, once more sought the presence of cardinal Antonelli, and prevailed upon him so far that he ordered the child to be brought back to the city, and allowed his parents several times to converse with him. These interviews are described as affecting, and Edgar earnestly entreated his father and mother to take him home, but this of course was a hopeless request. He had been baptized, and baptism, no matter by whom administered, was an inviolable rite, which laid the Catholic church under the solemn obligation of protecting its son from the snares of parental infidelity. It dared not give him up. Signor Mortara and his wife had to go away without their child. The case soon became known throughout Europe, and excited great indignation, more particularly in England. The evangelical alliance drew up a protest, which was signed by the archbishop of Canterbury and above twenty other bishops, by a large number of peers, members of parliament, heads of colleges, and ministers of the gospel, by upwards of a hundred mayors and provosts, and by many other influential laymen. It was presented to lord John Russell, the British Jews presented another. Nothing, however, was effected by these efforts. Edgar Mortara remained, of his own choice, the result would seem to prove, in the hands of the Roman Catholic church authorities. He was educated for the priesthood, became an Augustinian monk of the monastery Notre-Dame de Beauchêne, and preached his first sermon in 1874. The narrative, which created such excitement as echoed this boy's name over all the world, was at the time taken by the judicious as an *ex parte* statement; no authorized exposition of the facts, on the part of the Roman authorities, having ever been made public.

**Mortar-vehicle**, a class of gun-boat for mounting sea-service mortars, and in some cases provided with steam-power. The mortars are usually of the largest caliber—13 inch. To enable the mortar to be properly maneuvered, and to resist the recoil from the nearly perpendicular explosion of so great a piece of ordnance, the vessel has considerable breadth in proportion to her length. The mortar is slung amidships in a massive bed. The ancient form of mortar-vehicle was the "bomb-ketch," convenient because of the length of deck without a mast. The present vessels originated during the Russian war, and were found serviceable at the bombardment of Sveaborg.

**Mortgage**, in English law, is the temporary pledging of land in security of a debt; and as the land cannot be delivered into the creditor's hand, he acquires a hold over it by a deed called an indenture, or deed of mortgage. The ordinary form of a mortgage deed resembles an absolute conveyance, but it contains a proviso that if the money borrowed is repaid within a certain time, then the mortgagee shall reconvey the land to the mortgagor or borrower. There is a mode of executing a mortgage without any deed, which is common with bankers and others who lend money. This consists in the borrower taking the title-deeds of his land to the banker, who keeps the deeds and lends money on the faith of them. This is called an equitable mortgage by deposit of title-deeds, but in point of fact it is as good as any other mortgage. Mortgage deeds do not require in England to be registered, except in Middlesex and Yorkshire; and hence a person not infrequently mortgages his property two or three times over, though the security is insufficient for all the debts. But in general this can only happen by the careless-ness of one or other of the mortgagees, for the first mortgagee ought to have the title-deeds in his possession, and ought not to part with them, as they are his chief protection. A mortgagee can assign his mortgage security to another person, who thereupon stands in his shoes. If the money is not paid at the time originally appointed in the deed, then interest becomes due, and the deed is held as a security for both principal and interest. The remedy which the mortgagee has if the money is not paid at all, or not paid after
The mortgagee may exercise the power which the deed always contains to sell the estate and pay himself out of the proceeds; or the mortgagee may enter into possession and draw the rents and pay himself by installments. Or he may foreclose the mortgage, i.e., he commences a suit in the court of chancery, the effect of which is to allow a short time to the mortgagee to pay the debt, failing which the court will order it to be sold to satisfy the debt. Another remedy is for the mortgagee to sue the mortgagee for the money in an ordinary action. All these remedies may be pursued at once and at the same time. Sometimes when a second and third mortgage are given over the same estate, which is often done when the estate is large compared with the money borrowed, it happens that the third mortgagee gets a prior title to the second mortgagee by buying up the first mortgage. On doing this he can tack the third mortgage on to the first by the doctrine known as the tacking of mortgages. As a general rule, if nothing is said, the mortgagee or borrower pays all the costs of the mortgage transaction. Until the estate is sold, or the security foreclosed, the mortgagee has what is called the equity of redemption, i.e., he can at any time, on payment of the debt, compel the mortgagee to reconvey the property to him. Mortgages in England are not a first-class security, and hence trustees who are not specially authorized by their deed or will to invest in mortgage security do it at their risk, it being assumed that the only investment which is absolutely safe is government stock. In Scotland mortgages are generally called bonds and dispositions in security, and form a higher and better security than in England, owing to there being a regular system of registration of deeds affecting land; and hence trustees are entitled to invest their funds there in mortgage security, which is considered as safe as government stock, and less liable to fluctuations of interest. In Scotland there is no such practice as mortgaging lands with banks by merely depositing the title deeds. See Bond, Disposition in Security.

MORTGAGE (note). In early times the only way to create a mortgage under the common law was to give livery of seisin of a freehold estate, thus passing the estate to the pledgee and his heirs. Afterwards a peculiar form of mortgage was created as an estate for years, the only right of the mortgagee being to pay the debt on the day specified, and thus clear his land of the obligation. If he failed to do this the estate was lost beyond recovery. The modern doctrine that time is not of the essence of the contract was established by equity courts and is founded on the distinction in Roman law between hypotheca and piguus; if the property was left in the hands of the mortgagee, the law of hypotheca was applied; if given over to the mortgagee, the law of piguus. While the common law considered a mortgage as a freehold estate, equity preferred to regard it as a pledge, and, as equity is supreme within its own domain, the latter law relating to the subject has now come under the control of its courts, and the old feudal ideas have given way.

Three views then might be taken—that a mortgage is an estate possessing all the common-law incidents except that it is not absolute until foreclosure has been had; that it is a quasi interest of the mortgagee in the land without those incidents; or that it is a pledge (hypotheca) with the right of foreclosure. In every mortgage the estate and the debt or obligation are distinct, and the mortgagee cannot seize until the debt is due, though the decisions in some of the states seem to recognize a title before the time set for payment. Whether the assignment of the debt or not carry the mortgage with it is also a point on which the laws of the different states are not uniform. A conditional sale is often closely akin to a mortgage. In the latter there is a contract right of the creditor to obtain the land at some time after the non-payment of a debt which is a charge on the land; while in a conditional sale the contract stipulates that the vendor may repurchase at a fixed price; the existence of non-existence of intention to procure a loan or obligation making the distinction. The tendency of courts is to consider such an agreement a mortgage, if there be any doubt. Where there is clearly a conditional sale intended there is no equity of redemption in the vendor after the date specified. This, it will be seen, makes it of great importance to ascertain the true nature of the contract. A recent case on the subject is that of Bassett v. Bradley, reported in the last (1880) volume of the Connecticut Reports.

No special form of words is necessary to create a mortgage, if it be clear that the real property is held for payment of the obligation. Wherever the statute of frauds is in force, the mortgage must conform to its provisions. As to construction, parol evidence may be received to prove the existence of a contract, even though the deed seems on its face to be absolute. This, however, is allowed only when the parties have not reduced the whole of their negotiations to the form of a written contract; otherwise the usual rule as to written instruments applies. Though no special form of language must be used, yet to secure a debt must be described as intelligible to an examination of an interested party. If the obligation of the mortgage be to pay money it is almost always accompanied by a note or bond, but this is not necessary. If the obligation be to perform or to not to perform a particular act, a bond should be given. If the note be lost, the loss must be set out in the pleadings, as it is the evidence of the debt which the mortgage is given to secure.

The rights and relations of the mortgagee and mortgagor are governed by the local laws of the states, the only universal rights being that of the mortgagor to pay before foreclosure, and of the mortgagee to hold the property for the debt. The provisions as
Mortgage. Mortimer.

to registration and foreclosure can be learned only by reference to the statutes of each state. Where the seizure is considered as in the mortgage, he has the right to enter at any time, and, after entry, is regarded as a tenant in possession, and liable to the mortgagee for rents or profits received. No essential change in the property can be made by the mortgagee without the consent of his mortgagee. After foreclosure the mortgagee either takes the estate or the property is sold under statute regulations to satisfy the debt. He may bring an action for his debt in a court of common law if he choose, but must do so, if at all, within the time set by the statute of limitations. The usual method of foreclosure is by bringing a bill in equity setting out all the particulars of the mortgage contract and asking that a day be appointed before which the debt must be paid or the foreclosure proceed. Notice must be given to all parties interested. If there be several mortgagees, the court will appoint a day before which the mortgagee must redeem, or the subsequent day before which the last mortgagee may assume the mortgage on which foreclosure is asked, and so on up to the mortgagee who brings the petition. If payment be not made, a certificate of foreclosure is issued and recorded. If the mortgagee be an absolute one, the foreclosing party acquires full title to the property; but a strict foreclosure is unusual, the law generally providing that the land or other real property shall be sold at auction, and the claims paid in order of precedence, so far as the proceeds will allow. By common law, if the sum realized will not pay the amount of the debt, the mortgagee has no further remedy, but, by the laws of most of the states, the property is appraised, and judgment given by the court of equity for the excess, though sometimes the mortgage is sent to a court of law for remedy. The mortgagee may refuse to accept payment before the day appointed. A tender of payment on the proper day met by refusal will usually release the mortgagee, but under that date is of no avail. The mortgagee may be compelled by law to give a release or quit claim deed after receiving payment, and it should always be required in order to make the record of title clear. Where the mortgagee has had the right of entry, and has applied rents or profits to the payment of the debt, the mortgagee may by a bill in equity be made to account therefor; he is also liable for waste, or any act tending to injure permanently the value of the property. This follows from the doctrine of equity that the seizure has not left the mortgagee. Assessments for public improvements in most states take precedence over mortgage liens. When a mortgaged property is sold it has been held in New York that the vendee does not become responsible for the mortgage debt beyond the value of the land, unless he specially assume the lien; but this is not the case in other states. Where the mortgage and debt are held to be one, they both pass on assignment of mortgage, but elsewhere they are severed. If the mortgage is paid in full by one of two or more mortgagees, the others are compelled to contribute, and equity considers him as an assignee of the whole mortgage.

MORTIER, ÉDOUARD ADOLOPHE, CASIMIR JOSEPH, Duc de Tresviso; 1768—1835; first a soldier under the republic in 1790, adj gen. in 1799, in the battles of Mons, Bruxelles, Lorient, under gen. Kleber in 1794, repulsed the Austrians on the German frontier in 1796 and retook Mayence; gen. of division in 1799, charged by Napoleon with the conquest of Hanover in 1803, made marshal in 1804, head of an army corps in 1805, distinguished for skill in making resistance to an overwhelming force of Russians at Leoben the same year, in 1806 occupying Hanover and making the siege of Stralsund; in 1807 best the Swedes at Anlamb and Friedland; and at the peace of Tilsit June 21, was made governor of Silia and duke of Tresviso. In 1808 in Spain at the siege of Saragossa, and the battles of Ocana and Gibora; in 1809—11, with the French army in the Russian campaign, received the order to blow up the Kremlin, and after the battle of Krasnoe in Nov. 1812 commanded the rear-guard in retreat; arrived at Frankfort-on-the-Main late in 1812 and participated in the bloody battles of Bautzen, Dresden, and Leipzig early in 1813; fought in retreat with Napoleon in 1814, and when the latter was beaten, and at Elba gave adhesion to the government of Louis XVIII. On the return of Napoleon from Elba joined him, and received command of the eastern department of France. After the hundred days he was reinstated in office by Louis, became member of the chamber of deputies in 1816, and of the chamber of lords in 1819. After the revolution of 1830 he was made ambassador at St. Petersburg, grand chancellor of the legion of honor in 1831, minister of war and president of the council under Louis Philippe in 1834—35, and died by a missile from the infernal machine of Fieschi while engaged in a public review by the king's side.

MORTIFICATION, in Scotch law, is a term used to denote land's given for charitable or public uses. When lands are so given, they are in general formally conveyed to the trustees of the charity, to be held blench, or in fee. When mortifications are given in general to the poor, without naming particular trustees, they fall under the administration of the Court of Session. By the statute 1623, c. 6, it was declared unlawful to alter any mortifications, and the managers were rendered liable to be called to account for misappropriation. Any person entitled to the benefit of the land can pursue actions of this kind.

MORTIFICA TION, in Medicine. See INFLAMMATION.

MORTIMER, Roger, earl of March, 1287—1350, also baron of Wigmore; for some years a faithful adherent of Edward II, and his representative in Ireland, but in 1320
joined the insurgent barons who were hostile to the favorite, Despensers. In 1322 Mortimer was captured at Boroughbridge and imprisoned in the Tower of London, but escaped to France. There he met and fascinated queen Isabella, wife of Edward, became her paramour, and determined upon the overthrow of the king. With a small force he landed on the English coast and was soon joined by large numbers of the discontented nobles and common people. The king was defeated, taken prisoner and soon assassinated in his dungeon. Mortimer took the title of earl of March and was given confiscated estates of great value. Edward III. was but 14 yrs. old, and though a court held the regency, Mortimer's influence was supreme. He caused the death of Kent and Lancaster, both uncles of the young monarch. The latter resolved to be king in fact as well as name, had the earl of March seized at Nottingham castle and summoned a new parliament. Mortimer was tried on charges of treason; condemned, and in 1330 hung, drawn and quartered near Smithfield.

MORTIS CAUSA DEED, in Scotch law, is a deed which is made with a view to come into effect on the death of the maker. Since in Scotland land cannot be conveyed by will, as in England, it is necessary to execute an ordinary deed of conveyance, and to reserve the maker's life-rent, and to keep in it his own possession until his death, i.e., to suspend its effect during the life of the grantee.

MORTISE AND TENON (Fr. mortaise, probably from Lat. morderere, to bite; tenon, from tenir, to hold), a form of joint in carpentry. The tenon is a projection, generally rectangular in form, on the end of a piece of wood, cut so as to fit exactly into a deep groove (called the mortise) cut in another piece, so that the two are united at a required angle. The framing of doors, shutters, and such pieces of joinery, is usually fitted together with mortise and tenon joints.

MORTMAIN, the Statutes of (Fr. mort, dead, and main, hand). The object of the statutes of mortmain is to prevent priests and others from importing a dying man to convey his land for charitable purposes. Hence, though a person can, up to the last hour of his life, if possessing sufficient knowledge of what he does, devise by will all his land to individuals absolutely, it is otherwise if he intends to give the land to trustees for a charitable purpose, as to build a church, or school, or hospital. The statute of mortmain, 9 Geo. II. c. 36 (1736), reciting that public mischief had greatly increased by many large and improvident dispositions made by languishing and dying persons to charitable uses, to take place after their deaths to the disinheritance of their lawful heirs, enacted, that in future no lands or sums of money to be laid out in land should be given to any person or body, unless such gift or conveyance should be made or executed in presence of two witnesses twelve months before the death of the donor or grantee, and be enrolled in the Court of Chancery within six months after the execution. Therefore, a person on death-bed cannot in England give land, or money to buy land, for a charitable purpose. It can only be done in the life of the donor, at least twelve months before his death; and the property must be completely alienated, so that he has no further control over it. The deed must have a present operation, and must not reserve any life interest to the donor or his representative. The validity of this statute has sometimes been questioned, and several well-known modes of evading the statute have been adopted from time to time. The act has been held to apply only to land locally situated in England; and hence, if the land is situated in Scotland, or the colonies, or abroad, a will conveying it for charitable purposes will receive effect. In Scotland, the mortmain act had no application; but it was not needed, as the common law of Scotland also put a similar check on the alienation of land on death-bed, which, however, has been abolished by statute. See Death-bed, Intestacy.

MORTMAIN (ante), the alienation of real estate to a corporation. The term, however, is generally used of religious corporations. In consequence of the feudal restrictions on alienation, a corporation was obliged to get a mortmain license to make a valid purchase of lands. One of the chief objections to the alienation of land to religious corporations, was the loss to the lord of the fee, of the ordinary feudal profits, such as reliefs, wardships, and marriages, by the vesting of land in a technical person who cannot die or suffer attainit. The license of the sovereign was necessary, as the lord to whom, in the last resort, the fee would ultimately revert. If there were an intermediate lord between the alienating tenant and the king, his license must also be obtained for the alienation; for want of such license, the land was forfeitable to the lord, after entrench. Licenses were necessary in Saxon times, and after the conquest, they are recognized in the constitutions of Chancery. But the tenure continued to increase its lands, in spite of the mortmain act, by the grant of leases, etc., and the alienation without a license reverted, in the first instance, to the immediate lord of the fee. To escape this forfeiture, the tenant made a conveyance to the religious corporation, and then held the land as its tenant; the corporation thus obtained a sufficient seisin, to enable them to enter upon the land as immediate lord, under color of a surrender or forfeiture. By the 36th chapter of Magna Charta, such conveyances were made void. The prohibition in Magna Charta applied to religious houses only, so that religious corporations were exempt from its provisions; and the religious houses evaded it, by buying in lands that were really held of themselves as lords of the fee, or by taking long terms for years. To meet these evasions, the statute, 7 Edw. 1., De Religiosis, was passed.
The restrictive statutes applied to conveyances between the parties only, and the religious houses evaded them by bringing a suit to recover the land on a pretended title, in collusion with the tenant who would let the suit go by default. This kind of collusive suit came afterwards into general use under the name of a common recovery. The 2d statute of Westminster enacts a prohibition of this evasion, and the statute Quia empiiores, permitting free alienation, expressly excepts alienation in mortmain. The next ecclesiastical device was to convey the land to feoffees to the use of the religious houses. The seisin thus remained in the feoffees, who were held by chancery to account for the rents and profits. This was the origin of uses and trusts. The statute 15 Richard II. declares all lands conveyed to the use of ecclesiastical persons, without the license of the king or intermediate lord, to be forfeited. The statute 29 Henry VIII. prohibited the conveyance of land for superstitious uses to non-corporate bodies also. Meanwhile, it had always been possible for the crown to grant a mortmain license enabling a corporation to purchase and hold lands. At the time of the revolution, some doubts were felt in regard to the validity of such license, and by the statutes 7 and 8 William III. it was enacted that such license should henceforth be granted by the king, in his discretion. It is held that the before-mentioned statute of Henry VIII. applies to superstitious and not to charitable uses, so that a bequest to a hospital, for instance, was not voided by it. The mortmain acts have not been re-enacted in the United States except in a very few states; a corporation can hold land, but only a charitable corporation can take by devise. In some states the amount which can be bequeathed to charitable uses is limited by statute; within that limit the devise is good.

MORTON, a co. in the central part of Dakota, drained by the Missouri, which bounds it on the E., and by the Cannonball and Heart rivers. It is very scantily settled, the combined population of Morton, Mercer, Billings, and Stark counties being in '80, 1523. The surface is a rolling prairie with little wood. The Northern Pacific railroad passes through the center. Fort Abraham Lincoln and fort Rice are on the E. border.

MORTON, Fourth Earl of (James Douglas), regent of Scotland, was the second son of Sir George Douglas of Pittendreich, and in 1553 succeeded, in right of his wife, Elizabeth, daughter of the third earl, to the title and estates of the earldom. He early favored the cause of the reformation, and in 1557 was one of the original lords of the congregation. Sworn a privy councilor in 1561, he was appointed lord high chancellor of Scotland Jan. 7, 1563. Having been one of the chief conspirators against Rizzio, the Italian secretary of queen Mary, on his assassination, Mar. 9, 1566, he fled with his associates to England, but, through the interest of the earl of Bothwell, soon obtained his pardon from the queen. Though privy to the design for the murder of Darnley, on the marriage of the queen to Bothwell, he joined the confederacy of the nobles against her. He was present at Carberry hill when Bothwell parted from the queen, and after Mary's imprisonment in the castle of Lochleven he was restored to the office of high chancellor, of which he had been deprived, and constituted lord high admiral of Scotland. On the death of the earl of Mar., Oct., 1572, he was elected regent of the kingdom. His rapacity and avarice made him obnoxious to many of the nobles, and as the young king, James VI., desired to assume the reins of government, Morton resigned the regency in Mar., 1578.
Subsequently obtaining possession of the castle of Stirling, with the person of the king, he recovered his authority, but was accused of participating in the murder of Darnley, and being tried and condemned, was beheaded at Edinburgh, June 2, 1581.

MORTON, Charles, 1626-93; b. England; educated at Oxford. He took orders in the English church, and was at first attached to the royalist party. He afterwards sided with the Puritans, and was obliged to give up his living in Cornwall on account of non-conformity. Soon after 1662 he opened a school at Newington Green, where Daniel Defoe was one of his scholars. To escape the persecution of the ecclesiastical courts he came to Massachusetts Bay in 1686, accompanied by his pupil Penhallow, the future historian of the Indian wars. The same year, he became minister of the church in Charlestown, where he remained till his death. During a part of this time he was vice-president of Harvard college, and wrote a system of logic for use there.

MORTON, George, b. England, 1585; joined the Separatists, and settled, with his brother Thomas, at Leyden. He went over to London in 1629, where he became the agent of the Separatists. In 1623 he came to Plymouth, Mass., in the ship Ann, bringing emigrants and supplies to the pilgrims. Some years later he went back to England, where he died at a date unknown. He published in England, in 1629, a description of the Plymouth colony, under the title of Mourt's Relation.

MORTON, Henry, Ph.D., b. New York, 1836; educated at the university of Pennsylvania. He first studied law, but afterwards took up chemistry, and in 1863 became professor of chemistry in the Philadelphia dental college. In 1869 he conducted a number of parties sent out to take photographs of the solar eclipse of Aug. 7, and the same year he took the chair of chemistry in the university of Pennsylvania. In 1870 he became president of the Stevens institute of technology, at Hoboken, N. J. He has contributed many papers to scientific periodicals, such as the Chemical News and the Philosophical Magazine.
Morton.

MORTON, James St. Clair, 1829–64; b. Philadelphia; graduated at West Point in 1851, and was appointed to the engineers. After serving as assistant professor of engineering at the academy, and taking charge of various works, he went to Central America at the head of the Chiriqui expedition in 1860. In the spring of 1862 he became chief engineer of the army of the Ohio, and in the following October was appointed to the same position in the army of the Cumberland, and soon afterwards he was made brig. gen. He built the intrenchments at Murfreesboro, and was engineer of the works at Chattanooga, in whose capture he took a prominent part. In 1864 he became chief engineer of the 9th army corps in Virginia, and served through the Richmond campaign, up to Petersburg, participating in the engagements at North Anna and Bethesda church. He was killed June 17, at the head of the union assault on Petersburg.

He published a number of works on engineering and fortification.

MORTON, John, Cardinal, Archbishop, 1410–1500; b. England; educated at Cerne abbey and Oxford. Through his practice in the court of arches he attracted the attention of cardinal Bourchier, who presented him to Henry VI., who made him a member of the privy council. Edward IV. also took him into favor, made him master of the rolls in 1473, and in 1478 bishop of Ely, and lord chancellor. He was not in favor with Richard III., who arrested him, and committed him to the custody of the duke of Buckingham, from whom he escaped and fled to the earl of Richmond on the continent. He is said to have suggested the union of the houses of York and Lancaster, by the marriage of Richmond with the daughter of Edward IV. Henry VII., on his accession, made Morton a member of the privy council, and on the death of cardinal Bourchier he was promoted to the see of Canterbury. In 1487 he was again appointed lord chancellor, and in 1493 pope Alexander VI. made him cardinal. His English life of Richard III., which bears the name of sir Thomas More has been attributed to Morton.

MORTON, John, 1724–77; b. Penn.; a surveyor by profession. In 1756 he was elected to the Pennsylvania legislature, in which he served for many years, part of the time as speaker. He was a delegate to the stamp-act congress, convened at New York in 1765, and for the next four years was high sheriff for Chester county, in that state. Soon afterwards he became a justice of the court of common pleas, from which he was promoted to the state supreme court. In 1774 he was elected to the continental congress, where he gave the decisive vote of his state delegation for the declaration of independence, and acted as chairman of the committee of the whole on the proposals for confederation.

MORTON, Marcus, LL.D., 1784–1861; b. Mass.; educated at Brown university, and admitted to the Massachusetts bar. He obtained a good practice, and became an active democratic politician. He served in congress, 1817–21; was a member of the state executive council in 1823; and the next year was elected lieutenant-governor. He sat on the bench of the state supreme court from 1825 to 1830, when he was elected governor of Massachusetts, beating Edward Everett, the whig candidate, by one vote. He had been an unsuccessful candidate for many years for this office, to which he was again chosen in 1842. He was collector of Boston during the administration of President Polk.

MORTON, Nathaniel, 1613–85; b. England; came with his father to America in 1623. On the death of his father he was taken into the family of gov. Bradford, whose wife was his maternal aunt, and early assisted the governor in public affairs. He was secretary of the colony in 1645, holding the office till his death. He had received a good education, and almost all the records of Plymouth colony during the 17th c., which were published in several large volumes by the government of Massachusetts, were in his handwriting. He published the New England Memorial; or a Brief Relation of the most memorable and remarkable Passages of the Providence of God manifested to the Planters of New England, etc. It was compiled mainly from the manuscripts of his uncle, William Bradford, and the journals of Edward Winslow, and included the period 1620–46. In 1680 he wrote a history of the Plymouth church.

MORTON, Oliver Perry, 1829–77; b. Ind.; the family name, Throckmorton, was shortened by his father. He was educated at the Wayne co. (Ind.) seminary, and Miami university; Oxford, Ohio; studied law; and was admitted to practice at the bar of Indiana in 1849. In the 2nd session of the Indiana bar, and in 1852 was elected a circuit judge. At an early age he interested himself in politics, at first as a democrat, but became a republican on the formation of that party. He ran for governor of Indiana in 1856 on the republican ticket; was defeated, and returned to the practice of law; but in 1860 was elected lieutenant-governor of the state; the governor having been chosen U. S. senator, Morton became governor, Jan. 16, 1861. The beginning of the rebellion found the state legislature and the attorney-general of Indiana democratic, and thus a fierce and active opposition against furnishing aid for the prosecution of the war. Gov. Morton, who gained the sobriquet of "the great war governor," devoted himself, heart and soul, to plans for placing Indiana strongly on the side of the union, and even elected a sufficient loan on his personal responsibility to meet the exigencies of the situation; this obligation was afterwards assumed by the state. In 1864 he was elected governor by a large majority; but in the following year experienced a stroke of paralysis, and was obliged to go to Europe for his health. He was absent only a few
months, and on his return resumed the duties of his office. In 1867 he was elected to the U. S. senate; and on the expiration of his term, in 1873, was re-elected for the term ending in 1879. In the senate he became the recognized leader of the republican party, while he accomplished a prodigious amount of labor, serving on the committees on foreign relations, agriculture, military affairs, private land claims, and privileges and elections. He was one of the principal promoters of the passage of the fifteenth amendment to the constitution, and sustained the administration in the effort to carry through the senate the proposed San Domingo treaty. For this last service he was offered the English mission, which he declined on the ground that his acceptance would involve the election of a Democratic senator in his place by the legislature of Indiana. At the republican national convention in 1876, senator Morton received 124 votes on the first ballot for president. He was a member of the electoral commission called to decide the question of the disputed presidential election; and afterwards strongly pressed an amendment to the law directing the method of counting the votes. Senator Morton was a man of powerful intellect and determined will, and an orator of great popularity through his vigorous and straightforward speech. During the latter part of his life his infirmities necessitated his use of assistance in moving about, and he had to be carried from the lobby of the senate chamber to his carriage. In his prime he was over 6 ft. in height, with a powerful physique.

MORTON, Perez, 1751-1887; b. Mass.; graduated at Harvard in 1771, and was admitted to the Boston bar. He pronounced the oration on gen. Joseph Warren, April 8, 1776. He was speaker of the state legislature, 1806-11, when he was elected state attorney-general, which office he filled with distinction till 1822. He married Sarah Wentworth Apthorp, formerly well-known as a writer of verses.

Morton, Samuel George, M.D., American physician and ethnologist, son of an Irish emigrant, was b. in Philadelphia, Jan. 26, 1799. He studied medicine in Philadelphia, Edinburgh, and Paris, and in 1824 settled in Philadelphia, where he contributed papers on physiology and embryology to scientific journals. In 1834 he visited the West Indies, and made observations on the development of races. In 1839 he was appointed professor of anatomy in the Pennsylvania medical college, and published his great work, Crania Americana, based on his collection of 867 classified skulls. In 1844 he published Crania Egyptiaca, based on the collection of George R. Gliddon, esq.; and in 1850 his last work, An Illustrated Synopsis of Human Anatomy, Special, General, and Microscopic. He died at Philadelphia, May 15, 1851. Morton may be regarded as the first American who endeavored to place the doctrine of the original diversity of mankind on a scientific basis. See the memoir of Morton prefixed to Nott and Gliddon's Types of Mankind (Philadelphia, 1854), a work largely illustrated by selections from his unedited papers.

Morton, Sarah Wentworth Aithorp, 1759-1846; b. Mass.; married in 1781 to Perez Morton (q.v.). She acquired considerable reputation by her verses contributed to the Massachusetts Magazine over the signature of "Philomela." Under that pseudonym she published at Boston, in 1799, Ovid, or the Virtues of Nature; an Indian Tale, in 4 cantos. This work was followed in 1797 by Beacon Hill, a poem in 5 cantos; and in 1823 by My Mind and its Thoughts, a mixture of verse and prose pieces.

Morton, Thomas, 1590-1646; b. England; a lawyer and member of Clifford's inn, London. He came to this country with Weston's colony in 1629. He soon returned to England, but came to Massachusetts bay with Wollaston in 1625, and took up his residence at Mount Wollaston, now a part of the town of Braintree. Morton called his settlement "Merry Mount," set up a may-pole there, and very much scandalized the Plymouth people by his merry-making. A small party came up from Plymouth in 1638, cut down the may-pole, took Morton to Plymouth, and sent him thence to England. Morton ventured to return in 1629, but was again sent home, and the next year his house at Wollaston was demolished. Morton, however, came once more to Massachusetts in 1643, and was imprisoned for a year by the authorities on account of his "seditious book, The New England Covenant, which he had published in England in 1632. This work contained a valuable account of the condition of Massachusetts, muddled with emasculating satire on the Puritans. The late J. L. Motley made Morton the subject of two novels, Morton's Hope and Merry Mount.

Morton, William Thomas Green, 1819-1868, b. Mass.; commenced studying dentistry in Baltimore in 1840, continued there for 18 months and settled in Boston. He is, more than for anything else, known as the introducer and discoverer of the surgically useful anaesthetic properties of sulphuric ether. His attention was first called to the subject in 1844 when attending lectures at the medical college in Boston, and after some experiments performed upon himself, he administered the ether to a man Sept. 30, 1846, and extracted a firmly rooted tooth without pain. He repeated the operation, and making known the results to Dr. John C. Warren, he administered ether to the latter's request in the Massachusetts general hospital, Oct. 16, 1846, to a man for the operation of removing a tumor from the jaw. Dr. Morton obtained a patent for the use of ether, under the name of "lethoan," in 1846, a month after the operation in the hospital, and a month after this, in England Dr. C. T. Jackson also claimed the honor of having made the discovery, and the Moynton prize of the French academy was awarded to him. Morton, however, won the great celebrity that has always attended the discovery.
equally awarded to Dr. Morton and to Dr. Jackson, but Dr. Morton declined to accept it, which resulted in his receiving in 1852 the large gold medal, the Mayownt prize in medicine and surgery. He claimed compensation from congress for his invention, the government having used it, and also from individuals, and he was involved in many suits. He received, however, no compensation, and his life was spent in contests, literary, and legal, in regard to his invention. Memorials were presented to congress signed by many physicians, but for one reason or another they failed to secure what was asked. His latter years were spent upon a farm at Wellesley, Mass. where he died, from an affection brought on by reading an article which sought to deprive him of the merit of his discovery.

MOSAIC, the art of producing artistic designs by setting small square pieces of stone or glass of different colors, so as to give the effect of painting. Both the origin of the art, and also of its name, are buried in obscurity; it was, however, much practiced by the ancient Romans, especially for ornamental pavements, specimens of which are almost always found whenever the remains of an old Roman villa are discovered. Under the Byzantine empire; it was also much used for the ornamentation of churches, in which it formed a large portion of the wall-decorations. It was re-introduced into Italy for the latter purpose about the middle of the 13th c. by Andrea Tafi, who learned it of some Greek artists employed at Venice in decorating St. Mark’s. Since then it has been especially an Italian art, and to such wonderful perfection has it been brought, that most minute pictures are produced by it. Within quite recent years, mosaics of surpassing beauty both in design and material, have been produced by Russian artists in the Imperial glass manufactories of Russia; those shown in the Russian department of the international exhibition (1862) have probably never been surpassed. The pieces of glass of every shade of color are technically called smalts; they are generally opaque, and are set in cement in the same manner as tiles or pavement. Some fine pieces of mosaic pavement have lately been produced in this country by Messrs. Minton & Co. of Stoke-upon-Trent, and by Messrs. Maw of Brosley, proving that the art only wants sufficient encouragement to obtain a high position. In Italy there are two very distinct varieties of mosaic work—i.e., the Florentine and the Roman; the former is entirely formed of pieces of stone or shell of the natural colors, and is limited in its application chiefly to floral and Arabesque designs. The latter is made of the glass smalts mentioned above, and has so wide an application, that most of the finest paintings of the best old masters have been copied in mosaic, and the pictures so taken form the almost imperishable decorations of the finest churches of Italy. The manufacture of the opaque glass or smalts for making the little square pieces called tessere of which the pictures are composed, is a very important one, and is carried on in the Vatican, where 25,000 shades of the various kinds of colored glass are produced.

MOSAIC GOLD. See Trix.

MOSAIC WOOL, or Wool Mosaic, is a remarkable application of the principle of mosaic-work to the production of woven or worsted rugs and carpets, having a definite design or pattern, independent of the ordinary processes of printing and weaving. Many artists in this direction have been made, chiefly on the continent; but the most successful is Mr. P. S. Crossley, in whose extensive carpet factory at Halifax the mosaic wool is produced as a regular department of manufacture.

In the first place, well-spun worsted threads are dyed to every color and almost every shade or tint, amounting to a hundred varieties in all. An artist prepares a full-sized drawing of the pattern or design, ruled all over with cross-lines; this is copied on lined paper by girls, each of whom takes as much of the pattern as will fill a square foot. A workman (or woman) having a good eye for color, examines each square piece of drawing in detail, and selects the proper color of thread suitable to every portion of it; the threads are a little over 200 in. long each, or about 17 ft., and are numerous enough to pack closely together into a mass of one sq. ft. in width and depth. A strong framework, 17 ft. long, is so arranged that all these threads can be stretched on it horizontally, tied at one end, and weighted with 4 lbs. to each thread at the other. One man under the direction of the workwoman who selects the colors, arranges these threads one in the other, only weighing them the other, and supporting them on a steel bar in the middle. This being done, the mass of 17 ft. in length is cut up into blocks of 20 in. long each, for convenience in after-operations. All these processes are for one sq. ft. only of the pattern, and they have to be repeated as many times as there are sq. ft. in it. Supposing a rug 6 ft. by 2, with a lion, tiger, or other device occupying the greater part of the surface; there must be 12 masses prepared, and as each mass contains 50,000 threads, there will be 600,000 altogether. Blocks are cut from each mass, and are placed in an iron box or frame, side by side; thus forming a quadrangular solid 6 ft. by 2, and 20 in. deep, with the threads arranged vertically. Now, to convert this into a great number of separate squares, the pattern of which is seen represented on the upper surface, formed by the ends of the colored threads, India-rubber is dissolved in camphine to the consistency of carpenter’s glue, and brushed well over the top, so that every individual thread shall receive its portion; this being dried, a second coating is applied; and afterwards a third. A backing of canvas, or of some kind of strong cloth, is cemented down upon the mass of threads by a glue of the same kind, and is scraped.
and rubbed until it adheres to every individual fiber. When dry, the mass of threads is raised up three-sixteenths of an inch, by a screw acting upon a movable bottom to the box. A very keen circular cutter, 12 ft. in diameter, and rotating 150 times per minute, quickly severs a horizontal slice three-sixteenths of an inch thick, the box of threads being caused by an endless screw to travel onward to meet the cutter. This slice when turned up, presents the picture complete, in a beautifully soft nap, or pile of woolen threads, supported by a canvas or woolen backing. It is a mere question of hand-work to convert this into a rug, carpet, coverlet, or wrapper of any kind. A second repetition of the same processes converts another slice into a second rug; and so on, until the mass of 20 in. in depth has been cut up into about a hundred slices, each forming one rug. As the blocks of 20 in. were originally cut from a mass of 200 in., the whole mass produces about a thousand rugs, all exactly the same pattern. It is this power of repetition which makes the process pay; for the great preparatory labor of selecting and arranging (say) 600,000 distinct threads could not otherwise be compensated for.

**MOSAYLIMA** (Little Moslem), one of the most important rivals of Mohammed, belonged to the clan Dúl, a division of the tribe of the Bani Hanífah, of Yumání in Nújíd. The traditions about his life and age are extremely contradictory and legendary. It appears, however, tolerably certain that he had risen to a certain eminence in his tribe, probably as a religious teacher only at first, before Mohammed assumed his prophetic office. The name he was known by among his friends was Rahmán, the Benign or Merciful; a term which Mohammed adopted as a designation of God himself. This word, which is Aramaic, was a common divine epithet among the Jews, from whom Mohammed took it, together with a vast bulk of dogmas, and ceremonies, and legends.

If, however, Mosaylima, as is supposed by some, assumed that name in the meaning of Messiah, Savior, it would prove that he had anticipated Mohammed in the apostleship, which is commonly denied. It was in the ninth year of the Hedjrah that Mosaylima, at the head of an embassy sent by his tribe, appeared before Mohammed, in order to settle certain points of dispute. The traditions are very contradictory on the circumstances whether or not Mosaylima was then already the recognized spiritual leader of his tribe. When they were introduced to Mohammed in the mosque, they greeted him with the orthodox salutation of Moslems—viz., "Saláh alyuk" (Peace upon thee), and after a brief parley, recited the confession of faith. Shortly after this event, Mosaylima openly professed himself to be a prophet, as well as Mohammed. The latter sent a messenger to him, as soon as he heard of this, to request him to reiterate publicly his profession of Islam. Mosaylima's answer was a request that Mohammed should share his power with him. "From Mosaylima, the apostle of God," he wrote, according to Abdufeda, to Mohammed, the apostle of God. "Now let the earth be half mine, and half thine." Mohammed speedily replied: "From Mohammed, the apostle of God, to Mosaylima, the liar. The earth is God's: he giveth the same for inheritance unto such of his servants as he pleaseth, and the happy issue shall attend those who fear him. Yet notwithstanding these testimonies, of probably late dates, it seems, on the other hand, perfectly certain that Mohammed made very great concessions to his rival—concessions that point to his having secretly nominated Mosaylima his successor, and that he by this means bought Mosaylima's open allegiance during his lifetime. It was not a question of dogmas, though they each had special revelations, but a question of supremacy, which was thus settled amicably. "Mohammed," Mosaylima said, "is appointed by God to settle the principal points of faith, and I to supplement them." He further had a revelation, in accordance with Mohammed's: "We have sent to every nation its own prophet," to the effect: "We have given unto thee [Mosaylima] a number of people; keep them to thyself, and advance. But be cautious, and desire not too much; and do not enter into rival fights."

When Mohammed was at the point of death, he desired to write his will. Whatever he may have wished to ordain, is uncertain; it is well known, at all events, that his friends did not obey his order, and refused to furnish him with writing materials, very probably because they did not like to be bound by his last injunctions. Sprenger supposes that he wished formally to appoint Mosaylima his successor, and that it was just this which his surrounding relations feared. Mosaylima then openly declared against Islam, and many parodies of the Koran sprang up in the Nújíd, ascribed to him. In the 11th year of the Hedjrah, it at last came to an open breach between the two rival powers. Abu Bekr, the caliph, sent Khalíd, "the sword of the faith," with a number of choice troops, to compel Mosaylima to submission. Mosaylima awaited the enemy at Rowwálah, in the village in the Wádí Hanífah. So formidable indeed was Mosaylima's force, that Walíd is said to have hesitated for a whole day and night before he undertook an engagement. Mosaylima unswervingly disapproved of his council. On the second morning, however, he advanced on the field in a battle which lasted until the evening, contrived with fearful losses of his own, to gain the victory. Mosaylima fell by the hands of a negro slave, and his head was cut off by the conqueror, and placed at the head of a spear, to convince both friends and foes of his death. Khalíd then advanced to the slain prophet's birthplace, in order to slay all its inhabitants. They, however, by a clever stratagem contrived to conclude an honorable peace, but had to embrace Islam. The Mosleymian "heresy" was thus stamped out, and only a few scattered remnants of the new faith
contrived to escape to Hasa and Basrah, where they may have laid the foundation of the later Karmathian creed.

It is extremely difficult to come to any clear notion of Mosaylima's real doctrines, as all the accounts that have survived of them come from victorious adversaries—adversaries who have not hesitated to invent the most scandalous stories about him. Thus, a love-adventure between Mosaylima and the prophetess Sajih, the wife of a soothsayer of Yamana, who is supposed to have stayed three days in his tent, is told with great minuteness, even to the obscene conversation that is supposed to have taken place between them during that time; the fact being that this story, which is still told with much relish by the natives, is without the slightest foundation. From the same source, we learn that Mosaylima tried to deceive his followers by conjuring-tricks. It seems, on the contrary, that Mosaylima was of much higher moral standing than Mohammed himself. Thus, he is said to have enjoined the highest chastity even among married people: unless there was hope of begetting children, there should be restriction of conjugal duty. Even the nickname "Little Moslem," given to him seems to indicate that he, too, preached the unity of God, or Islam, as the fundamental doctrine of faith. How far his religion had a socialistic tendency, and offered less show of dignity and outward morality to its followers, or whether it rejected fatalism, contained an idea of incarnation, and invested its preachers and teachers with a semi-mediatorial character, as the latest explorer of the Nedjed, Mr. Palgrave, tells us we have no means of judging. But we must receive these conclusions, probably drawn from the information of the natives, with all the greater caution, as that story of the prophetess Sajih, whom he reports, after his informants, not only to have been properly married to Mosaylima, but to have, after his death, become a devout partisan of Islam, and to have entered an "orthodox alliance," does not, as we said before, deserve the slightest credence.

MOSCHELES, IGNAZ, 1794-1870, b. Prague; studied music under Dionysius Weber at the Prague conservatory, and at the age of 11 was the best pianist in Prague, and had begun to compose. In 1808, he went to Vienna, where he met Beethoven and Haydn, and took lessons from Albrechtsberger, who had been Beethoven's teacher. He soon won a reputation in concert, and disputed with Hummel the honor of being the first pianoforte player in Germany. After a tour of Germany, Holland, and France, he visited England, which was his residence till 1846. From 1825, he was professor in the London academy and conductor of the philharmonic concerts. The music of Beethoven was almost unknown in England at that time; and Moscheles, by his rendering of the sonatas and concertos of that composer, made the pianoforte a fashionable instrument. He was the most successful teacher, in his day, in England; but many later pianists, as most notably, Liszt and Thalberg, have surpassed him in execution. In 1846 he became professor at the conservatory at Leipzig. His own compositions are additions to classical music, and his compositions for other instruments than the piano show a profound theoretical knowledge. He published with notes, an English translation of Schindler's Life of Beethoven.

MOSCHI, a people of Asia living s. of the Caucasus. According to Pliny they dwelt around the sources of the Phasis, between the Euxine and Caspian seas. At the time of Augustus their territory is said to have been divided between Colchis, Armenia, and Iberia; and from them a mountain range extending from the Caucasus to the Anti-Taurus was called the Moschic mountains. Their name by early writers is often coupled with that of the Titherni, and the two people are generally identified with the Moschech and Tabal of Scripture.

MOSCHI D.E., or (recently) Mosch'ine. See Musk Deer, ante.

MOSCHUS, a bucolic poet who lived in Greece in the 3d c. B.C., and whose writings are classed with those of Bion who was his master. The two writers are published together in a translation in Bohn's Classical Library. He wrote in the Doric dialect, and all his works that have been preserved are fragmentary, idyllic, and pastoral in character, but much admired by scholars.

MOSCOW, an important government of Central Russia, lies s. of the governments of Tver and Vladimir. Area, 12,552 sq. m.; pop. 70,1,772,624. The surface is level with the exception of a tract in the s.w., which is elevated. It is watered by the Moskva and the Kliarma, while the Oka forms a portion of its southern boundary. The soil, principally clayey, with some sandy and stony tracts, is on the whole, unfertile, and barely supplies local consumption. Few of the governments of Russia, however, equal that of Moscow in manufactures and general industry. It contains numerous cloth, silk, brocade, chintz, paper, and other factories. China-ware is manufactured from the clay dug up in the district of Gielsk. Many of its villages carry on special branches of manufacture, of which glass, glass beads, and small looking-glasses for Asia is one. While limestone is quarried, and is much used for building in the capital; yellow marble quarries occur on the banks of the Oka. Peat is extensively used as fuel in the factories. Among the places historically celebrated are the monastery of St. Sergius, founded by one of the first Muscovite princes, and famous for its silver shrine, said to be the richest in the world; and the village of Borodino (q.v.).
MOSCOW (Russ. Moskiew), the ancient capital of Russia, and formerly the residence of the czars, is situated in a highly-cultivated and fertile district on the Moskva, 400 m. s.e. of St. Petersburg, with which it is in direct communication by railway. Lat 55° 40' n., long. 37° 33' east. Pop. 71,601,979. Previously to its being burned in 1812, Moscow was perhaps the most irregularly built city in Europe, and that dilution to a great extent it still retains; for, as the main object in 1812 was to build swiftly, the streets rose again on the old model, undulating and crooked, and consisting of alternating houses, the most varied in character and pretensions. Many improvements have, however, been recently accomplished in the city. Gas pipes have been laid along the streets; letter-boxes are placed at frequent intervals; the Romanzoff place, formerly so dirty, has been converted into a splendid square, with an ornamental garden, and the old obelisk, the former monument of the place, standing in the center, with water fountains on each side. The general view of the town, especially that obtained from an eminence on its southern side called the Sparrow hills, is eminently original and picturesque. Its hundreds of churches and convents, surmounted by gilt and variously-colored domes; its gardens and boulevards; and, above all, the high walls and crowded yet stately towers of the Kremlin or citadel, produce a most striking effect. The Kremlin, situated on the northern bank of the river, forms the center of the town, and around it, with a radius of about a mile, is a line of boulevards, extending, however, only on the n. side of the river. Outside of this line, and concentric with it, is another line of boulevards, with a radius of a mile and a half; while beyond all, and forming the girdle of the city, is the outer rampart, with a circumference of 26 English miles. The Kremlin comprises the principal buildings, as the cathedral of the Assumption of the Virgin, founded in 1326, a small but gorgeously-decorated edifice; the cathedral of the archangel Michael, containing the tombs of all the czars down to the time of Peter the great, who changed the royal burial place to St. Petersburg; the church of the Annunciation, the floor of which is paved with jaspers, agates, and carnelians of various shapes; the tower of Ivan Velikiy 200 ft. in height, and surmounted by a magnificent gilded dome, from which, as from all other similar structures,Within, the whole globe can be seen; the Cathedral of Ivan the Great (king of bulls), the greatest bell in the world; several palaces, and collections of ancient and other antiquities; the arsenal, surrounded by the splendid trophy of 850 cannon, taken from the French; and the senate. The walls of the Kremlin are surmounted by 18 towers, and pierced with 5 gates. In the town, the chief buildings are the cathedral of St. Vassili, remarkable for its peculiar architecture; the Gostiourov, or bazaar, and the exchanges. The temple of the Savior, which was commenced in 1812, to perpetuate the memory of the repulse of the French invasion, is not yet completed; but when finished it will be a magnificent architectural feature of this ancient capital. The university of Moscow, the first in Russia, founded in 1553, is attended by 1800 students, and contains a library of 160,000 volumes, museums of natural history, and a botanical garden. As intermediate educational establishments between the parish schools and the university, there are provided 3 high schools or gymnasia for males, and 3 for females; special establishments are the technological, the agricultural, the oriental, 2 commercial, and 3 military schools. There are several learned societies in Moscow, which is also the seat of a metropolitan, one of the three highest dignitaries of the Russian church. The public museum and library, which was removed from St. Petersburg in 1861, occupies a large and handsome building, formerly a palace, is rich especially in ancient Slavonic MSS., and has about 200,000 volumes.

Moscow communicates by railway with St. Petersburg, Nijni-Novgorod, Koslov, etc. It is the seat of an extensive manufacturing and commercial industry; it imports largely, and carries on a considerable export trade, especially with Asia. Its trade is chiefly in hides, leather, furs, wool, grease, isinglass, wax, honey, feathers and down, potatoes, soap, iron, and copper; cotton from Asia, silks from Persia, and Bokhara; Caucasian madder, home and Turkish tobacco, furs, tea, chemicals, and all the products of Russian manufacture, of which Moscow is the actual center. The chief manufactures are woolen and worsted goods, silks, brocades, dyeing, printing, tanning and skin-dressing, iron, copper, and silver works, and chandlery.

Moscow is of ancient origin for a Russian town. Its site was bought by Yuri Dolgoruki, in the 12th c., and a fortress built. In the 14th c. not only had it become the capital of the Russian religious world, owing to the residence there of the metropolitan, but it had also become the actual capital of Muscovy. In 1388, 1370, and 1372, it suffered from the inroads of the Lithuanians; in 1381 it was sacked by the Tartars. From 1413 to 1501 it was, on four separate occasions, partially destroyed by fires; and it was burned to the ground by Devlet-Girey, khan of the Crimean Tartars, in 1571. It was taken by the Poles in 1610, and remained in their possession till their expulsion by the Russians under Minin and Pojarsky in 1612. In 1682, 1689, and 1688, it was the theater of the revolts of the Strelitz. In 1812, from Sept. 14 till Oct. 24, it was in the hands of the French.

MOSCOW (antique). The present population of Moscow is about 700,000. Its growth within the past 30 years has been more rapid than at any former period, and it has become the center of the Russian system of railways. Though the newer parts have added boulevards, wide avenues, parks, and stately architecture to the attractions of the
Moseley.
Moses.

old city, it is the picturesqueness of the Kremlin, its aggregation of old and new palaces, its fortified walls and lofty towers, its churches, mosques, monasteries, domes, spires, and minarets, forming from a distance perhaps the most remarkable architectural scene in the world, that is still the greatest attraction of Moscow; and is even heightened in its effects by contrast with the old narrow and tortuous streets, their mingled poverty and magnificence, with the open, airy, and polished beauty of the new. Moscow is said to exceed in area any European capital except London and Constantinople. It is 466 m. s.e. of St. Petersburg, and 900 m. c. of the extreme westerly part of the empire.

MOSELEY, Henry, d.d., 1802-72; b. England; educated at Cambridge. He was for a number of years professor of natural philosophy and astronomy in King's college, London. He had already taken holy orders, and in 1853 was appointed canon of Bristol cathedral. He was afterwards presented to the living of Olveston, and made chaplain to the queen. He was a member of the school-board for many years. He published a number of books, including Advices on Mechanics Applied to the Arts, and Mechanical Principles of Engineering and Architecture.

MOSELLE (Ger. Mosch), an affluent of the Rhine, rises in the Vosges mountains, France, at an elevation of 2,280 ft. above the level of the sea, not far from the sources of the Saône. Its course is north-westerly as far as Pont-à-Mousson, in the department of Meurthe, where it becomes navigable; then n. to Thionville, near the French frontier; after which it proceeds in a north-easterly direction (latterly, with many zigzag picturesque windings) through Luxembourg and Rhenish Prussia, joining the Rhine at Coblenz. On its way it passes the towns of Remiremont, Epinal, Toul, Pont-à-Mousson, Metz, Thionville, and Treves. From Metz to Treves it flows through a broad valley, inclosed by rounded vine-bearing hills. Its entire length is upwards of 350 miles. Its principal tributaries are the Meurthe, the Seille, and the Sarre on the right, and the Orne, the Sure, and the Kyll on the left. The wines grown in the basin of the Moselle are noted for their lightness and their delicate aromatic flavor. The inferior kinds are liable to acidity.

MOSELLE WINES. See German Wines.

MOSENTHAL, Salomon Hermann, b. 1821, in the Prussian province of Hesse; a German dramatist, chiefly known by the dramas Deborah and Sowannahdes, which have been represented with success, and translated into English, Danish, Hungarian, and Italian.

MOSER, George Michael, 1705-83; b. Switzerland. At an early age he went to London, and became a gold-chaser. To this he at length added enamel painting, chiefly for lockets and watch cases, and won the notice and commendation of sir Joshua Reynolds. He was one of the founders and first keepers of the Royal academy, in which last capacity he was superintendent of the students in drawing from the antique.

MOSER, Johann Jacob, 1701-83; b. Germany; made professor extraordinary of law at the university of Tbingen in 1726. Six years later he became councilor at Stuttgart, and in 1727 he became ordinary professor of law at Tbingen. He resigned this chair on account of a quarrel with his colleagues, and for the same cause left the directorship of the university at Frankfort-on-the-Oder. He was engaged for many years in the preparation of his most important work, on the Public Law of Germany, and other legal books. He afterwards opened an academy in Hanover, where the sons of the nobility were taught public affairs.

Moses (Heb. Mosihi; LXX. and Vulg. Mose; or Messon; Copt. Moshehe, i.e., drawn out of the water), prophet and legislator of the Israelites, born about 1600 b.c. in Egypt (or Heliopolis), during the period of their hard bondage. His father was Amram, his mother Jochebed, both of the tribe of Levi. The tale of his birth and early education has, by tradition (Manetho, Philo, Josephus, Midrash, etc.), received a much more extraordinary legendary character than is found in Exodus; while the main features are, on the whole, the same in them all. And there is no reason to doubt the truthfulness of an account which shows us Moses, like many other supreme benefactors and "suns" of mankind, struggling against an apparently adverse fate, nay for very life, from the instant of his birth. The well-known narrative, to which late traditions (contained in Philo, Josephus, the Fathers, etc.) have supplied questionable names and dates, is that Moses's mother, unable to hide the child—which was to have been drowned at his birth—longer than for the space of three months, put it into a basket of papyrus, and hid it among the Nile rushes, Miriam, his sister, watching it from afar. The king's daughter (Theramith, or Merrie?), coming down to the river, observed the weeping child, and was so struck with its beauty that she allowed Miriam to fetch a Hebrew nurse, Joche-
Moseley.

Moses.

bed. Grown up, he was sent to the king's palace (Heliopolis) as the adopted son of the princess, and here seems to have enjoyed not only princely rank, but also a princely education. He is also said to have received a priestly education under the priest, whom he subsequently married, and to have been a mighty adept in all the sciences of "Egypt, Assyria, and Chaldea," to have led Egyptian armies against the Ethiopians, defeated them, and pursued them to their stronghold, Saba (Meroe); this place being delivered into his hands by Tharbis, the king's daughter, whom he subsequently married. The Bible contains nothing whatever about the time of his youth. He first reappears there as the avenger of a Hebrew slave, ill-treated by an Egyptian overseer. Threatened by the discovery of this bloody act, he escapes into Midian, where he is hospitably received by Jethro, the priest, and married his daughter, Zipporah. He stayed for many years in Midian, tending the flocks of his father-in-law. This most sudden transition from the brilliant and refined life of an Egyptian court, of which he had been brought up a prince, to the state of a poor proselyte, childless shepherd, together with the influences of the vast desert around him, must in Moses's mind have produced a singular effect. The two events which he gave to his sons, strikingly express part of what filled his soul—a feeling of gratitude for his salvation from the avenging hand of justice, and the deep woe of his exile. The fate of his brethren went now to his heart with greater force than when he was a prince and near them. There rushed upon his memory the ancient traditions of his family, the promises of Jehovah to the mighty sheikhs, his forefathers, that they should become a great and a free nation, and possess the ancient heritage of Canaan; why should not he be the instrument to carry out this promise? The Elgie asher Elgie (I am that I am) appeared to him while his mind was occupied with such thoughts, and himself put the office upon his shoulders. A new king had succeeded in Egypt, his old enemies were either dead or had forgotten him, and Moses returned to Egypt. Together with Aaron, his brother, the man of small energy but of fine tongue, he consulted about the first steps to be taken against the king as well as with their own people—both of whom treated them at first with suspicion, nay, with contempt.

After ten distinct plagues (more or less akin to natural phenomena peculiar to Egypt), the last being the death of all the firstborn, Pharaoh consented to let his slaves go free, "that they might serve their God." Moses very soon had occasion to prove that he was not only the God-inspired liberator of his people, who in the enthusiasm of the moment had brazen the great king and his disciplined armies, but that he possessed all those rarer qualities which alone could enable a man to mold half-brutalized hordes of slaves into a great nation. Calmness, disinterestedness, patience, perseverance, meekness, coupled with keen energy, rapidity of action, unfailing courage—"wisdom in council and boldness in war"—constituted the immense power which he held over the hundreds of thousands who knew no law in their newly-acquired liberty, and who were apt to murmur and to rebel on any or no provocation. Nor were the hostile Bedouin tribes, whose territories the new emigrants approached, easily overcome with untrained warriors, such as formed the ranks of Moses's army. The jealousy of certain elders fostering seditions within, added to his unceasing vexations; and to fill the measure to overflowing, indeed, his own brother Aaron, whom he had made his representative during his temporary absence on the Mount of Sinai, himself assisted in the fabrication of an idol. His sacred office as legislator he in reality first assumed in the third month after the Exodus, when, after many hard and trying marches and counter-marches—from Goshen to Succoth (Latopolis, the present old Cairo); thence, by a detour, to Etham (Ramleh); Pharaoh's chariot, (Beleda), through the Red sea, to the desert of Sin (al-Djofar), Marah, Elim (Wadi Gharandel), desert of Sin (Wadi Mecitteh, or Wadi al-Sheikh), Dophka, Ains, Raphidim (near the Makkad Sindha Moses)—made more trying by want of food and of water, by encounters with Pharaoh's and the Amalekites, having arrived near the Mount of Sinai, he made the people encamp all round, and ascended the summit of the mountain by himself. On the incidents connected with the "revelation" made to the whole people, we need not dwell any more than on any other part of this well-known narrative. Suffice it to point out briefly, that the tendency of the whole law was to make the Hebrews a people "consecrated to the Lord," "a holy people, and a kingdom of priests," i.e., a people of equals both before God and the law.

Three distinct parts compose this Mosaic constitution. The doctrine with respect to God and his attributes; the "symbolical" law, as the outward token of his doctrine, and the moral and social law. The Decalogue forms a kind of summary of all the three; the existence of Jehovah as the Absolute Being, the liberation of the people and the prohibition of polytheism, and the representation of the divinity by visible images (I.—III.). While the institution of the Sabbath, the symbol of creation and the Creator, forms the first; the Levitical ceremonial, and the laws relating to the inter-course among the members of the human commonwealth; the gratitude of children is inculcated; murder, adultery, theft, false witness, coveting of others' goods are prohibited. The groundwork of these regulations had, indeed, been a special inheritance in the family of the Abrahamic line from the earliest times; but the vicissitudes of fortune, the various migrations, and the enormous increase of this family, and its being mixed up for long years with the surrounding idolaters, had obliterated nearly all traces of the primeval purity of creed in the populace. The wisdom displayed even in the minor regulations of the Mosaic dispensation, with respect to their adaptation to the peculiarity,
of the race, the climate, the political state of the country which they were to inhabit; in the hygienic regulations, and the rules which treat of the social and domestic relations; and, above all, the constantly-reiterated caution from mixing again with other nations, such as they found them in Canaan—and the neglect of which subsequently proved their ruin—is traced to a direct influence of Jehovah, generally indicated by the words, "And God spake to Moses, speak unto the children of Israel." An amply ritual, in connection with the tabernacle, or constantly-visible symbol of a divine dwelling; the allegory of an ever-new covenant represented by sacrifices, prayers, purifications, kept the supreme task of being priests and a holy people uninterruptedly before the eyes of the nation. The tribe of Levi (q.v.) to a certain degree acted in this respect as permanent representatives; and not to Moses's sons, but to his brother Aaron and his descendants, was intrusted the office of high-priest.

When on the eve of entering into the promised land, the people broke out in open rebellion, and threatened, by a spontaneous return to the land of slavery, to undo the entire work of Moses's life. Convinced that they were not as yet fit to form a commonwealth of their own, the liberator and lawgiver had to postpone, for the long space of 40 years, the crowning act of his work; and, in fact, did not himself live to see them taking possession of the hallowed territory. How these years of nomadic journeying through the desert (El-Tyh or Al-Tyh Beni-Israel) were spent, save in rearing up a new generation of a more manly and brave, as well as more "civilized" stamp, we can only conjecture. All those who had left Egypt as men were doomed to die in the desert, either by a natural death, or by being suddenly "cut off," in consequence of their openly defying Moses, and through Moses Jehovah. The apparent lack of incidents during this period has indeed furnished grounds for various speculations on this subject, and critics have tried to reduce it to a much shorter space, without, however, being able completely to meet their point. Even Goethe, with more ingenuity than knowledge of the subject, has endeavored to prove the "forty" to be a mythical round number, the real time being two years. The testimonies of the Hebrew prophets and historians, however, are perfectly unani-

mous on the subject (cf. Jos. v. 6; xiv. 10; Amos, ii. 10; v. 26; Ps. xcv. 10, etc.) and modern criticism has mostly endorsed the number as in keeping with the circumstances. On the first month of the fortieth year after the exodus, we find Moses at the head of an entirely new generation of Hebrews at Kadesh, in the desert of Pharan or Zin. Here his sister Miriam died. Here also, for the first time, Moses seeing the new generation as stubborn and "hard-necked" as their fathers, is recorded to have despaired of the Divine Providence; and his disobedience to the letter of the command given to Him, "to speak to the rock," is alleged as the reason "that his bones too had to fall in the desert." His brother Aaron died at Hor (near Petra, according to Josephus and St. Jerome), whether the Israelites had gone never. Not long afterwards, Moses once more had occasion to punish with relentless severity the idolatrous tendencies of the people (Baal-Peor), thus showing that age had had no power of making him relax his strong rule over the still half-savage and sensuous multitude. Having finally fixed the limits of the land to be conquered, and given the most explicit orders to Joshua, to Eliezer, and the chiefs of the ten tribes, respecting its division, he prepared the people for his own impending death. He recalled to their minds in the most impressive language, their miraculous liberation, and no less miraculous preservation in the desert. Their happiness—their life—was bound up, he told them, in the divine law, communicated through him by Jehovah. A recapitulation of its principal ordinances, with their several modifications and additions, and reiterated exhortations to piety and virtue, form the contents of his last speeches, which close with one of the grandest poetical hymns. The law was then handed over to the priests that they might instruct the people in it henceforth; Joshua was installed as successor (while his own sons sunk into the obscurity of ordinary Levites), and he blessed the whole people. He then ascended the mount of Nebo, from whence he cast a first and last look upon the land for which he had pined all his life, and on which his feet were never to tread. He died upon this mountain, 120 years old, in the full vigor of manhood, according to the Scriptures, "and no man knew his burial-place up to this day"—so that neither his remains nor his tomb were desecrated by "divine honors" being superstitiously paid to them.

This is a summary of Moses's life as derived from biblical as well as non-biblical sources. The latter—except, perhaps, the very doubtful traditions of Manetho—belong, whatever may be the date of the respective documents of the Pentateuch, to a much later age, and bear the air of tradition and legend, grown out of those very documents, so painful on their face, that they are of about the same importance for historical purposes as the cycle of Midrash-sagas that have gathered around Moses, and which are reproduced variously in Moslem legendaries. On his office as a "prophet," what was the more the less clear, being elaborated by various later traditions, especially among the Abrahamites, and how much of his laws is due to Egyptian influ-

ences; whether part of them was first inaugurated by later generations and ascribed to him, or whether others were never carried out at all: on these and similar questions which have been abundantly raised, more especially in recent times, we must refer for fuller information to the special works on the subject. Some notices of the more important points will be found under Genesis, Jews, Pentateuch, Decalogue, etc. There seems, however, but one conclusion. The brief span of human history of which we
have any knowledge, shows few, if any, men of Moses’s towering grandeur—even with all the deductions that the most daring criticism has yet proposed.

MOSHEIM, JOHANN LORENZ von, a distinguished church historian of Germany, was b. at Lübeck on Oct. 9, 1794, and studied at Kiel. In 1723, he became ordinary professor of theology at Helmstedt, from which he was removed in 1747 to a similar office in Göttingen. He died chancellor of the university of Göttingen, Sept. 9, 1755. His theological works are numerous, amongst which are a work on Bible morality, 

Sittenlehre der Heiligen Schrift (new ed. continued by J. P. Miller, 9 vols. Helmst., 1770-78); and discourses, Heiligen Reden (3 vols. Hamb., 1722, et seq.). But his most important contributions to theological literature are in the department of ecclesiastical history, in which his Institutiones Historiae Ecclesiasticae (Helmst. 1755) is familiar to every student as a work of great learning, fullness, and accuracy. It has been translated from the original very elegant Latin into English and other languages. The best English translation is that by Dr. James Murdock (3 vols. New York, 1822), of which there are many reprints. Besides this, Mosheim is the author of Institutiones Historiae Ecclesiasticae (3 vols. Gottingen, 1731; Dissertatio de Hist. Ecclesiastica Yntercellantes (2 vols. new ed. Altona, 1767); and Verzeichnisse von Kirchengeschichte (2 vols. Helmst., 1746-48). His stand-point is that of liberal orthodoxy; yet he is essentially dogmatic, and pays more regard to the mere "opinions" of men than to the character and genius shining through them; hence, his Church History is far inferior in point of richness, depth, and suggestiveness to that of Neander.

MOSKWA, a river of European Russia, a branch of the Oka, which is itself a branch of the Volga. It is celebrated in history for the great battle, called the battle of Boro- 
dino (q.v.), fought on its banks, Sept. 7, 1812, from which Ney (q.v.) obtained his title of Prince of Moskwa. The Moskwa rises in a marsh in the government of Smolensk, passes close by the towns of Meshinsk and Svenigorod, passes through the city of Moscow, and joins the Oka near Kolomna, in the government of Moscow. The whole length of its course is about 290 miles. A considerable commerce is carried on by boats on the Moskwa, and it is directly connected with the Volga by the Moskva Canal.

MOSLEM. See MUSULMAN; MOHAMMEDANISM; etc.

MOSOSSAU'BUS, MOUSE LIZARD, a genus of large marine lizards, whose remains occur in rocks of cretaceous age. Three species are known, one from the upper chalk of Sussex, a second from the cretaceous beds of North America, and the third from the Maestricht beds. This last (M. Hofmanni) was first known from a nearly perfect head dug out of St. Peter's Mount in 1799, and popularly called the great animal of Maes- 

tricht. Originally the property of Hofman, it was taken from him, in virtue of some clause in their charter, by the ecclesiastical authorities of Maestricht, who, in their turn, were compelled to give it up to the victorious French army, and by them it was removed to Paris. It is said that the French cannoniers, when preparing for the siege, had instructions not to point the artillery toward that part of the town in which the precious specimen was deposited. The head is 4 ft. in length, and the animal to which it belonged is estimated to have been 25 ft. long. The total number of the vertebrae was 133; they were concave in front and convex behind, and were fitted to each other by a ball- 

and-socket joint, admitting of easy and universal flexion; the sacrum seems to have been wanting. The limbs were developed into four large paddles, and these with the com- 

paratively short and strong tail, the bones of which were constructed to give great musc- 

ular power, enabled the animal to move quickly through the water in pursuit of its prey. The jaws were furnished with a single row of strong conical teeth. Cuvier first showed the affinities of the animal. It is most nearly related to the modern monitor, but differs from all modern lizards in its peculiar adaptations for an ocean life, and in its great size. The largest living Lacertian is only 5 ft. in length, and of this a large proportion is made up by the tail; the Mososaurus, with its short tail, is estimated to have been at least 25 ft. long.

MOSQUE, a Mohammedan house of prayer. The word is derived, through the Italian moschea, from the Arabic me'utilisateur. The form of the oldest mosques (at Jerusalem and Cairo) is evidently derived from that of the Christian basilica, the narthex being the origin of the court, with its arcade, and the eastern apses repre- 

senting the principal buildings of the mosque facing Mecca. The original forms became, 

however, entirely obliterated in the progress of Mohammedan architecture, and the mosques, with their arcaded courts, gateways, domes, and minarets, became the most characteristic edifices of Saracenic art. Wherever the Mohammedan faith prevailed, from Spain to India, beautiful examples of these buildings exist. They vary consider- 

ably in style in different countries, the Saracens generally borrowing much from the architecture of the various nations who adopted their faith. In India, the mosques have many features in common with the temples of the Jains, while in Turkey they resemble the Byzantine architecture of Constantinople. Everywhere the dome is one of the leading and most beautiful features of the mosques, which commonly consist of pavilions surrounding an open square, in the center of which is a tank or fountain for ablution. Arabesques and sentences of the Koran inscribed upon the walls, which are
generally white-washed, and never hear any device representing a living thing, are the only ornaments of the interior. The floor is generally covered with mats or carpets; there are no seats. In the s.e. is a kind of pulpit (Minbar) for the imâm; and in the direction in which Mecca lies (the Kibîlî), there is a niche (Mehrab) toward which the faithful are required to look when they pray. Opposite the pulpit, there is generally a platform (Dikkch), surrounded by a parapet, with a desk bearing the Koran, from which portions are read to the congregation. The five daily prayers (see Mohammedanism), which are generally said at home—especially by the better classes—on week-days, are said in the mosque by the whole congregation on Fridays, the days of Al-Gumah, or the assembly, the Moslem Sundays, together with some additional prayers, and at times a sermon is superadded to the service. It is not customary for women to visit the mosques, and if they do, they are separated from the male worshipers. The utmost solemnity and decorum are preserved during the service, although in the hours of the afternoon (when there is no moon) the part of the mosque is seen hanging, clattering, even engaged in their trade, in the interior of the sacred building. On entering the mosque the imâm takes off his shoes, carries them in his left hand, sole to sole, and putting his right foot first over the threshold, he then performs the necessary ablutions, and finishes by putting his shoes and any arms he may have with him upon the matting before him. The congregation generally arrange themselves in rows parallel to that side of the mosque in which is the niche, and facing that side. The chief officer of a mosque is the nazîr, under whom are two imâms, a kind of religious official, in no way to be compared with what we understand by a clergyman of a creed, but who performs a certain number of religious rites, as long as the nazîr allows him to do so, and who, being very badly remunerated, generally has to find some other occupation besides. There are further many persons attached to a mosque in a lower capacity, as muehdins (q.v.), howards (door-keepers), etc., all of whom are paid, not by the contributions levied upon the Moslems, but on many of the mosques is paid by contributions made by the people, and are derived from lands. Many of the larger mosques, there are schools, academies (medressas), and hospitals connected, and public kitchens, in which food is prepared for the poor.

MOSQUÉRA, RUY GARCIA, 1501–55, b. Spain, a navigator who accompanied Sebastian Cabot to South America in 1526, where nine years later he joined Pedro de Mendoca in founding Buenos Ayres. His descendants for three hundred years have been prominent and influential in Colombia.

MOSQUITO (Spam. gnat), a name very generally given to the most troublesome species of culex, and allied genera. See GNAT. The name mosquito is given, according to Humboldt, in some parts of tropical South America to species of simulâ, which are active during the day, whilst species of culex, active chiefly during the night, are called zancudos; but these latter are the mosquitoes of other countries generally. The name was probably first used in the West Indies, where it particularly designates a species (C. mosquito) very similar to the common gnat, but not quite so large, with black proboseis, and marked with silvery white on the head, thorax, and abdomen. It abounds in the warm parts of America, especially in marshy districts and in the vicinity of stagnant waters. It and similar species extend even to very northern regions, appearing during the heat of summer in prodigious swarms. Similar species are found also in similar situations in almost all parts of the world, and are almost as great a pest in Lapland as within the tropics. The bite which they inflict is painful, and their incessant sharp buzzing prevents sleep. In India and other countries, beds are provided with mosquito curtains of gauze, which are closely drawn, to protect the occupant, while the natives who cannot avail themselves of such protection, smear their bodies with oil. So numerous are mosquitoes in some localities in South America, that the wretched inhabitants sleep with their bodies covered over with sand three and four inches deep, the head only being left out, which they cover with a handkerchief; and travelers have been obliged to have recourse to the same expedient. Even thick clothes afford at best a very partial protection from mosquitoes, being readily penetrated by the proboscis. Mosquitoes are readily attracted to a lamp, and perish in its flame; but where they are numerous, a lamp only causes additional swarms to congregate to its neighborhood until it is extinguished, as is often very soon the case, by their dead bodies.

MOSQUITO COAST. Mosquito Territory, or Mosquitia, formerly a native kingdom, under the protectorate of Britain, lies on the e. coast of Central America, having Honduras on the n., Nicaragua on the w., and Costa Rica on the south. The area is estimated at 15,000 English sq.m., but as 20,000 m. of contested territory lies between it, and Honduras and Nicaragua, its extent would be more correctly given at 25,000 sq. miles. The coast is low, with many bays and lagoons, and possesses a number of good harbors. The two principal rivers are the Rio Segovia (which rises within 23° of the Pacific ocean), and the Rio Esccondido, both of which flow into the Caribbean sea. The climate is rainy, and the temperature, considering the latitude, is cool and equal, the thermometer seldom rising above 82° or falling below 71°. On the whole, this territory is one of the most healthy parts of Central America. Ague is not unusually common, epidemics are exceedingly rare, and white people who do not recklessly expose themselves enjoy the best health. The swampy grounds are generally covered with
dense forests, in which dye-woods and timber-trees of great value abound. Rice, maize, manioc, and other tropical plants, are cultivated. The country abounds in deer of various kinds, half-wild horses and oxen roam in the savannas, which are covered with tall grasses, the alligators and serpents are common. The chief exports are mahogany, cocoa, ginger, sarsaparilla, and tortoise-shell, but the whole trade is inconsiderable.

The inhabitants of various races, the greater portion being aboriginal, but many are a cross between the native Indians and runaway negroes; they do not number more than from 10,000 to 15,000 in all. Their chief occupations are hunting and fishing, but a little agriculture and cattle breeding are also practiced.

The Mosquito Coast was discovered in 1502 by Columbus, and though never conquered, was claimed by Spain till about 1660, when the king, with consent of his people, placed himself under the protection of Britain. British colonists at different times attempted to found settlements in various parts of the country, but from various causes were soon after compelled to withdraw. Of late years they have met with more success. The foothold Britain thus obtained in Central America was viewed with great jealousy by the United States, who left no means untried to effect her expulsion. During the British protectorate a sort of constitutional government was established, consisting of a legislative body, and regular jury courts. In July, 1850, the United States and Great Britain bound themselves by the Clayton-Bulwer treaty "not to occupy, fortify, colonize, or exercise dominion over the Mosquito Coast, or any part of Central America;" and in November, 1859, Britain ceded the protectorate of Mosquito Coast along with the Bay islands to Honduras, a proceeding which gave rise to much discontent among the natives of the coast, and a complete rebellion of the islanders. However, by a subsequent treaty, concluded Jan. 26, 1860, the whole territory was finally handed over to Nicaragua.

MOSS-AGATE. See Mocha Stone, ante.

MOSS-BUNKER, or Bony Fish. See Mennadeen, ante.

MOSSES, Musci, an order of acotyledonous plants, consisting of mere cellular tissue without vessels, and distinguished from Hepaticae (q.v.), the order with which they are most nearly allied, by having always a leafy stem, and an operculated capsule or urn (sporangium or theca), which opens at the top, and is filled with spores arranged around a central column (columnella). The capsule is covered by a hood (calyptra); and when it is ripe, and has thrown off the calyptra and operculum, exhibits around its mouth a single or double row of rigid processes, few or numerous, but always either four or a multiple of four, collectively called the peristome. These reproductive organs are viewed by many botanists as female flowers or pistillaria; whilst reproductive organs of another kind, sometimes found on the same plant, but more generally on distinct plants, are regarded as male flowers or androecium. These are minute cylindrical sacs, occurring in the axis of the leaves, or collected into a head inclosed by variously modified leaves at the summit of the stem, and finally bursting and discharging a great number of spheroidal or oval vesicles, through the transparent walls of which, when moistened with water, filaments (sporozooids) coil up within them may be seen wheeling rapidly round and round.

As the sacs merely discharge these vesicles and perish, it is supposed that the sporozooids contained in them may effect the fertilization of the spore-producing capsules; but this wants confirmation, and their particular office as reproductive organs is not yet fully ascertained.—None of the mosses are large plants, many are very small. Many have elongated stems, often branching; others have the stem scarcely developed, so that they seem to consist of a mere tuft of leaves. They are generally social in their manner of growth. They are among the first plants which begin to clothe the surface of rocks, sands, trunks of trees, etc., adapting inorganic matter for the support of higher kinds of vegetation. They love moisture, and are generally more abundant in cold and temperate than in hot climates. They struggle for existence on the utmost limits of vegetation in the polar regions and on mountain-tops. They dry up and appear as dead in a very dry state of the atmosphere, but revive when moisture returns. Some of them grow in bags, which they gradually fill up and consolidate. They are of great use in protecting the roots of many plants from cold and from drought, and afford harbor to multitudes of insects. Some of them supply food for cattle, particularly for the reindeer, when nothing better is to be obtained, and a wretched kind of bread is even made by some of the dwellers in the Arctic regions, of species of Sphagnum. Some are astrigent and diuretic, but their medicinal virtues are unimportant. Among the other principal uses to which they are applied by man are the packing of things liable to be broken, the littering of cattle, the covering of garden plants in winter, and the stuffing of the empty space in roofs to moderate the heat of attic rooms in summer and their cold in winter—perhaps the most important use to which they are ever put, at least in Britain, and to which, as the benefit is great and easily attained, it is wonderful that they are not much more frequently applied. The abundance of mosses in meadows and pastures is disagreeable to farmers. The best remedies are proper drainage, the application of lime, and the liberal use of other manures, by which the soil may be enriched, so that better plants may grow with sufficient luxuriance, upon which the mosses are choked and disappear.

Several thousand species of mosses are known. Many of the mosses are very beauti-
ful, and their capsules and other organs are interesting objects of study, even with an ordinary magnifying-glass.

MOSS-TROOPERS, marauding bands that inhabited the borders between Scotland and England during the last half of the 17th c., compelling the viehage to purchase security by paying a constant rent to them. They were called moss-troopers because they dwelt in the mooses and always rode in troops. In Fuller's \textit{Worthies of England} it is stated that, at one time, they numbered several thousands, and that their great enemies were "the laws of the land and the lord William Naworth," who finally reduced them to legal obedience. Scott mentions them in \textit{The Lay of the Last Minstrel}.

MOSTAR, a t. of European Turkey, capital of Herzegovina (q.v.), on the Narenta, forty-five miles s.w. of Bosnia-Sarai. It is surrounded by embattled walls, contains ten mosques, a Greek church, and a famous Roman bridge of one arch, ninety-five ft. in span. Silk, grapes, and wine are produced, and knife-blades and weapons are manufactured. Mostar is also a place of considerable trade. Pop. 18,000.

MOUL, a t. of Asiatic Turkey, in the province of Al-Jezirah (ancient Mesopotamia), is situated on the right bank of the Tigris, opposite the ruins of ancient Nineveh (q. v.), and 180 m. up the river from Baghdad. It is surrounded by walls, and is still in a more flourishing condition than most Turkish towns, on account of its caravan trade with Diarbekir, Bagdad, and Aleppo, though its prosperity is nothing to what it formerly was. During the middle ages it supplied all Europe with its rich manufactures—\textit{museline}, according to Marco Polo, got their name from this town, now, on the contrary, the bazaars of Mosul are filled with the manufactures of the west. The peculiarity of its diminished importance are the rise of Abashehr (q. v.) as an emporium of trade, and the opening up of the new sea-route to India by the istmus of Suez. Mosul is the seat of a Jacobite patriarch, and was formerly the great metropolis of all the Moslemaptian Christians (the Nesorians, the United Chaldeans, the Jacobites, etc.), but war, pestilence, famine, Mohammedan proselytism, oppression, and incessant anarchy have greatly reduced their numbers. Pop. estimated at from 18,000 to 40,000, of whom about a fourth are Christians; 1500 Jews; the rest Mohammedans (Arabs, Kurds, and Turks).

MOTACIL L.D.E. See WAGTAIL.

MOTAZILITES, or MUTAZALITES, a "heretical" Mohammedan sect, dating a few generations after Mohammed, of which brief mention has been made under the heading \textit{Mohammedan Sects}. Their name is derived from an Arabic word, denoting to "separate one's self;" and originally applied to any special sect or union of men, but the Motazilites becoming the most important and dangerous in Islam, they received this denomination by way of eminence. They were also called Moattalites—i. e., those who divest God of his attributes—and Kadurija, i. e., "those who hold that man has a free will, and deny the strict doctrine of predestination." The first beginnings of this sect are traced to Mahad, who, in the time of Mohammed himself, already began to question predestination, by pointing out how kings carry on unjust wars, kill men, and steal their goods, and all the while pretend to be merely executing God's decrees. The real founder of the sect, as such, however, is Wasi'il, b. Atya. He denied God's "qualities," such as knowledge, power, will, life, as leading to, if not directly implying polytheism. As to predestination itself, this he only allowed to exist with regard to the outward good or evil that befalls man, such as illness or recovery, death or life, but man's actions he held to be entirely in his own hands. God, he said, had given commandments to mankind, and it was not to be supposed that he had, at the same time, preordained that some should disobey these commandments, and that, further, they should be punished for it. Man alone was the agent in his good or evil actions, in his belief or unbelief, obedience or disobedience, and he is rewarded according to his deeds. These doctrines were further developed by his disciple, Abu'l-Hudail, who did not deny so absolutely God's "qualities," but modified their meaning in the manner of the Greek philosophers, viz., that every quality was also God's essence. The attributes are thus not without but within him, and so far from being a multiplicity, they merely designate the various ways of the manifestations of the Godhead. God's will he declared to be peculiar kind of knowledge, power, will, life, as what he, forever to be unalterable in the mind. Man's freedom of action is only possible in this world. In the next, all will be according to necessary laws immutably preordained. The righteous will enjoy everlasting bliss; and for the wicked, everlasting punishment will be decreed. Another very dangerous doctrine of his system was the assumption that, before the Koran had been revealed, man had already come to the conclusion of right and wrong. By his inner intellect, he held, everybody must and does know—even without the aid of the divinely given commandments—whether the thing he is doing be right or wrong, just or unjust, true or false. He is further supposed to have held, that unless a man be killed by violent means, his life would neither be prolonged nor shortened by "supernatural" agencies. His belief in the traditions was also by no means an absolute one. There was no special security, he said, in a long, unbroken chain of witnesses, considering that one fallible man's evidence could correct the whole truth.

Many were the branches of these Motazilites. There were, apart from the disciples of Abu'l-Hudail, of whom we have just spoken, the Jobbains, who adopted Abu Ali
Al-Walihab’s (Al-Jobblai’s) opinion, to the effect, that the knowledge ascribed to God was not an “attribute;” nor was his knowledge “necessary;” nor did sin prove anything as to the belief or unbelief of him who committed it, who would anyhow be subjected to eternal punishment if he died in it, etc. — Besides these, there were the disciples of Abu Hanifah—the Hashenites, who held that an infidel was not the creation of God, who could not produce evil. Another branch of the Motazilites were the disciples of Ahmed Ibn Hayet, who held that Christ was the eternal word incorporeal, and assumed a real body; that there were two gods, or creators, one eternal, viz., the Most High God, and the other, material, viz., Christ—not unlike the Socinian and Arian theories of this subject; that there is no successive transmigration of the soul from one body into another, and that the last body will enjoy the reward or suffer the punishment due to each soul; and that God will be seen at the resurrection with the eyes of understanding, not of the body.

Four more divisions of this sect are mentioned, viz., the Jâhidians, whose master’s notion about the Koran was, that it was “a body that might grow into a man, and sometimes into a beast, or to have, as others put it, two faces—one human, the other that of an animal, according to the different interpretations.” He further taught them, that the damned would become fire, and thus be attracted by hell; also, that the mere belief in God and the Prophet constituted a “faithful.” Of rather different tendencies was Al-Mozdar, the founder of the branch of the Mozarians. He not only held the Koran to be uncereated and eternal, but so far from denying God the power of doing evil, he declared it to be possible for God to be a liar and unjust. — Another branch was formed by the Pasharians, who, while they carried man’s free agency rather to excess, yet held that God might doom even an infant to eternal punishment—all the while granting that he would be unjust in so doing. — The last of these Motazilite sectarians we shall mention are the Thammanians, who held, after their master, Thamama, that sinners would undergo eternal damnation and punishment: that free actions have no producing author; and that, at the resurrection, all infidels, atheists, Jews, Christians, Magians, and heretics should be returned to dust. We cannot, in this place, enlarge upon the different schools founded by the Motazilites, nor upon the subsequent fate. The vast scientific development, however, which their doctrines begot, and which resulted in the encyclopedic labors called “The Treatises of the Socinian Brethren and True Friends,” are touched upon under “Socinian Brethren” (q. v.). See Well, Geschichte der Kirchen; Sale’s Koran; Steinhe, Motaziliten; Dieterici, Transactions of the German Oriental Society, etc.

**MOTETT**, a name applied to two different forms of musical composition.—1. A sacred cantata, consisting of several unconnected movements, as a solo, trio, chorus, fugue, etc. 2. A choral composition, generally also of a sacred character, beginning within an introduction in the form of a song, perhaps with figurative accompaniment; after which follow several fugue subjects, with their expositions, the whole ending either with the exposition of the last subject, a repetition of the introduction, or a special final subject. A motett differs in this respect from a double or triple fugue, that the subjects never appear simultaneously, but are introduced one after the other. In one form of the motett, the successive phrases of an entire chorale are treated as so many fugal subjects.

**MOTH**, the popular name of all the insects included in the section *Nocturna* of the order Lepidoptera (q. v.). They formed the genus *Phalera* of Linnæus, but are now distributed into many genera and families, the species being extremely numerous. Among them are the very largest *Lepidoptera*, and also the smallest. They are distinguished from hawk-moths, and from most of the butterflies, by their bristle-shaped antennae, tapering from base to apex. The antennae are frequently feathered or pectinated, especially in the males. The proboscis is generally similar to that of butterflies; but there are some groups of moths in which it is merely rudimentary, and these are supposed to take no food after they pass from the larva state. The thorax is generally shorter and more robust than in butterflies; the tibiae of the legs often bear a kind of spur; the wings are held either in a horizontal or in an inclined position when at rest; or, as in many of the smaller moths, are wrapped around the body. The hairs or bristles on the margin. The females of a few species are wingless. Most moths are generally nocturnal, although to this rule there are a few exceptions. They often exhibit great richness in beauty of colors, although in brightness of color they are not generally equal to butterflies. Their food is similar to that of butterflies; — They lay great numbers of eggs, which exhibit varieties of form and color as great as those of the insects themselves. Their caterpillars are more widely various in form and characters than those of the butterflies; differing from each other in the number of their legs, and in horns, protuberances, caudal appendages, hairy covering, etc. Some are social both in the larva and chrysalis state, forming, on entering the latter state, very curious nests. The chrysalis of a moth is never angular or furnished with protuberances, and is generally enveloped in a silken cocoon, closely close and compact; although some moth chrysalids are found in various directions filled with threads which cross each other in various directions. The Silk-worm (q. v.) moths are among the insects most useful to man; but moths in general are regarded by him as injurious, the larva of many feeding on leaves of various kinds, and often destroying valuable
crops; and the larva of some small species proving very destructive to clothes, books, etc. The largest and most splendid moths inhabit tropical countries. Some of the most interesting and important kinds of moth are noticed in separate articles. Notwithstanding a popular dislike of moths, observation of their habits and of the richness of color of many of them, is a favorite pursuit of naturalists.

**MOTHER CAREY’S CHICKEN**, a name familiarly given by sailors to the storm petrel and other small oceanic species of Petrel (q.v.).—The name **MOTHER CAREY’s Goose**, is in like manner, given to the great black petrel or gigantic fulmar (**Procellaria gigantea**), of the Pacific ocean; a bird of about three feet in entire length, with very long wings, and blackish gray plumage, a ravenous feeder on dead whales and all other animal garbage, and which also kills and preys upon other sea-birds.

**MOTHER OF PEARL**, the shells of the large bivalve mollusk *Molusdrina margaritifera*, which also produces the precious pearls. See PEARL. These shells are collected in vast numbers in the tropical seas, chiefly on the coast of Ceylon, Manilla, Cuba, Panama, and the South Sea islands. Those from Panama are small and thick, and are known in commerce as “ballock” shells; those from Manilla are finest in quality, often as much as a foot in diameter, round and flat. There are two varieties—the white or silver-lipped, and the black-lipped. So enormous is the trade in these shells, that the imports of this country alone amount to 3,000 tons per annum, the value of which is nearly £100,000. Although large quantities of these shells are consumed in making fancy wood work, papier-mâché, and in making knife-handles and other small ornamental objects, by far the greater portion is required for making buttons, chiefly in Birmingham.

**MOTHER WATER**, **MOTHER LYE**. See LYE.

**MOTHERWELL**, a town of Scotland, in Lanarkshire, eleven m. from Glasgow. Its progress, which of late years has been very rapid, is chiefly due to the coal mines in its neighborhood. Pop. (1861) 2,925; (1871) 6,943.

**MOTHERWELL**, William, a Scottish poet and antiquary, was b. in Glasgow, Oct. 13, 1797, and educated chiefly at the grammar-school of Paisley, where, in his fifteenth year, he entered the office of the sheriff-clerk. At the age of twenty-one, he was appointed sheriff-clerk depute of the county of Renfrew. In the following year he published his first work, the *Harb of Renfrewshire*, containing biographical notices of the poets of that district, from the 16th to the 19th century. This work was but the prelude to one of far greater importance—his *Minstrelsy, Ancient and Modern*, which appeared at Glasgow in 1827. In 1828 he commenced the *Paisley Magazine*, in which some of his finest original pieces first saw the light, and in the same year accepted the editorship of the *Paisley Advertiser*, a conservative journal. In 1830 he became editor of the *Glasgow Courier*. He died in that city, Nov. 1, 1853, at the early age of 38. Motherwell displays in his best moods (but *only then*) a rich, beautiful, and strong imagination, great warmth and tenderness of feeling; and a thorough knowledge of the language of a poet. His *Juvenile Moriscus* is unsurpassed for the unforced pathos and picturesque beauty of its reminiscences of boyish love; *The Sword-Chant of Thorstein Raud* is perhaps the most heroic verse in the English tongue; and the little piece beginning, “My heid is like to rend, Willie,” has seldom been read without tears. An enlarged edition of his poetical remains, with a memoir, was published in London in 1849.

**MOTHERWORT**, *Leonurus Cardiaca*, a plant of the natural order *Labiata*, found about hedges and in waste places in Europe, and now abundantly naturalized in some parts of North America. It is not very common in Britain, and probably has been introduced. It is perennial, has a branched stem about three feet high, stalked leaves, the lower ones three-lobed, and crowded whorls of reddish-white flowers. The calyx has five pungent spreading teeth. The upper lip of the corolla is shaggy on the upper side, the lower lip trifid. The anthers are sprinkled with shining dots. The plant was formerly in much use as a domestic pectoral medicine, but is now comparatively little employed. It has a strong, but not agreeable smell.—Other species of the same genus are found in Europe and the n. of Asia.

**MOTION.** Laws of, are the fundamental principles connecting force and motion in the physical universe; and are obviously to be derived from experiment alone, since intuitive reasoning cannot possibly give us any information as to what may or may not be a law of nature. Though these laws are derived from experiment, it cannot be said that we have any experimental proof of their truth—our most satisfactory verifications of them are derived from the exact accordance of the results of calculation with those of observation in the case of such gigantic combinations of mutually influencing bodies as that of the solar system; and it is by such proofs that they must be considered to have been finally established. They seem first to have been given systematically and completely by Newton, at the opening of the *Principia*; but the first two were known to Galileo, and some of the many forms of a part of the third were known to Hooke, Huyghens, Wren, and others. We shall give them here in order, with a few brief comments, showing their *necessity* and their *use*.

First, then, we naturally inquire, what matter would do if left to itself; and, by con-
sidering cases in which less and less external force is applied to a body, we are led to the statement called the first law of motion:

1. Every body continues in its state of rest or of uniform motion in a straight line, except in so far as it may be compelled by impressed forces to change that state.

This expresses simply the inertia of matter—i.e., a body cannot alter its state of rest or motion; for any such alteration external force is required. Hence the definition of force (q.v.), as that which changes or tends to change a body’s state of rest or motion.

Now, what is it that changes the state of motion produced by the force which produces it? This is obviously a new question, to be resolved by experiment; and the answer is the second law of motion:

2. Change of motion is proportional to the impressed force, and takes place in the direction of the straight line in which the force acts.

Newton’s silence is as expressive as his speech. Nothing is here said about the previous motion of the body, or about the number of forces which may be at work simultaneously. Hence, a force produces its full effect in the form of change of motion, whether it act singularly, or be associated with others; and whatever, moreover, he the original motion of the body to which it is applied. Hence, there is no such thing as equilibrium of forces; every force produces motion—and what we call equilibrium is not the balancing of forces, but the balancing of their effects. Hence, the absurdity of attempting to found the science of statics on any other basis than is to be derived from the second law of motion; which, in fact, leads us at once (by the parallelogram of velocities, which is a purely geometrical conception) to the parallelogram of forces, and thence, with the help of the third law, to the whole subject of statics. The second law also supplies the means of measuring force and mass; and of solving any problem whatever concerning the motion of one particle.

But more is required before we can study the motion of a system of particles—as a rigid body, or a liquid, for instance; or a system of connected bodies. Here there are mutual actions and reactions of the nature of pressure or of transference of energy (see Force) between the parts—and these are regulated by the third law of motion:

3. To every motion there is always an equal and contrary reaction; or, the mutual actions of any two bodies are always equal and oppositely directed in the same straight line.

Thus, the mutual pressure between two bodies has equal, but opposite, values for the two. The tension of a rope is the same throughout, and tends as much to pull back the horse at one end as to pull forward the canal-boat at the other. The earth exerts as much attractive force on the sun as the sun exerts on the earth—and the same law applies to the other attractive and repulsive forces, as those of electricity and magnetism.

But Newton goes much further than this; he shows, in fact, that action and reaction (subject to the third law) may consist in work done by a force, instead of the mere force or pressure itself. From this form of the third law we derive at once the principle of virtual velocities (q.v.), which in its application to machines is familiar as “What is gained in power is lost in speed.” But we also derive the grand principle of the indestructibility of work or energy; at all events in the case of the ordinary mechanical forces—and this must be regarded as one of the grandest discoveries which science owes to Newton. It is true that he merely mentions it, and then abruptly passes to another subject; yet we can hardly exaggerate the value of this single remark. Experimenters, mainly Davy and Joule, have since shown that all the physical energies, as heat, light, electricity, etc., are subject in their transformations to the third law of motion, and thus the system constructed by Newton for ordinary dynamical purposes, is now found to rule the most mysterious of the affections of matter. For a development of this, see our article on Force.

MOTION, ANIMAL. Motion or progression is that function by which an animal is able to transport itself from place to place. It is enjoyed exclusively by animals, there being nothing strictly analogous to it in the vegetable kingdom. The organs employed in locomotion are of two kinds, the passive and the active; the former including all those textures which form the skeleton, and by which its segments are united, as fibrous and arochar tissue, synovial membrane, cartilage, fibro-cartilage, and bone; while the latter includes the muscles with the nerves, which convey to them the mandates of the will.

Before proceeding to notice the different modes of progression of men and animals, it may be expedient to say a few words on standing, or the natural attitude of an animal. This attitude depends upon the form and functions of the limbs. Most of the terrestrial mammals and the reptiles (excepting the serpents), both of which use four feet in walking, have the backbone (the vertebral column) nearly horizontal (being only slightly concave downwards), and resting, at the same time, both on the fore and hind legs. Birds, whose anterior extremities are intended for flight, stand upon the posterior limbs only, although in their case, too, the backbone is generally nearly horizontal when the animal is at rest. Man alone stands erect with his head supported on the summit of the nearly vertical vertebral column. Some other animals (monkeys, hares, kangaroos, etc.) can rise more or less erect, but in their case the attitude is obviously not the natural one.

In standing it is requisite that the limbs should be so arranged that the center of gravity may fall within the space included by the feet. If the center of gravity does
not fall within this space the animal cannot stand, but must fall to that side to which the center of gravity inclines. On this account certain aquatic birds (the albatross, for example), which have their feet placed very far back, cannot use them for walking. If an animal has four legs, it is not necessary that they should have the broad base, which is essential in bipeds. We see that most quadrupeds have comparatively small feet, while birds are furnished with long toes, which, when spread out, form large bases of support. Moreover, the flexor muscles of the toes are so arranged that the weight of the body causes them to contract firmly, and hence birds are enabled to sleep standing without any effort.

Walking is the commonest form of progression. When it is accomplished by two legs only, as in man, the body is inclined forward, carrying the center of gravity in that direction; and while one leg supports the body the other is thrown forward to prevent it from falling, and to sustain it in turn. Hence, walking has been defined to be a continual falling forward, interrupted by the projection of the leg. Those writers who have especially studied the theory of walking (Borelli, the brothers Weber, and Bishop) have divided the time of a step into two portions—i.e., that in which one leg only rests on the ground, and in that which both legs rest on the ground. The period in which both feet are on the ground is shorter than that in which the body is supported by one leg only. During the time the body is supported by one leg, the other leg sways from behind forward, without the active intervention of its muscles, but by the mere force of gravity—in short, like the pendulum of a clock. When this leg is again placed on the ground the first interval ends, and the other—i.e., that in which the body is supported by both legs—begins, and, of course, terminates with the raising of the other leg. The time that the body is supported by both legs diminishes as the velocity increases, and vanishes as the walk merges into a run; while, on the other hand, it attains its maximum in extremely slow walking, when it is found by experiment to amount to half the time in which only one leg supports the body. The greatest velocity of walking is attained when the time of a step is equal to half the duration of the motion of the swinging leg, and the velocity in walking of any given person depends on the time taken in making each step, and on the length of the steps; and both of these are, again, dependent on the height at which the center of gravity of the body or the heads of the thigh-bones are carried above the ground; for as the height of the latter diminishes, the length of the step is increased, while its time is diminished, and vice versa. The best walkers are incapable of acquiring a speed of more than 7 m. an hour; and even this speed cannot be maintained for more than 1 hour. In trotting the horse we shall see that of bipeds, except that the body always rests on at least two legs. The limbs are raised in a determinate order, and usually in such a manner that the hind-leg of one side succeeds the fore-leg of the opposite side.

Running consists of the same succession of motions as walking; but these motions are so accelerated that there is a period between two steps when the body is not supported on either leg; and this constitutes the essential difference between the two processes. It requires a far greater expenditure of muscular force than walking, and cannot be long maintained without considerable exhaustion. First-rate runners can accomplish a mile in a few seconds under four minutes and a half, and 10 m. in an hour. (Levett in a match with Frost, which came off on Mar. 22, 1893, at Copenhagen Fields, ran 10 m. 250 yds. in 52 53's, and Deerfoot ran 11 m. 740 yds. at Brompton in an hour.) In quadrupeds there are various paces besides walking, which are known as trotting, cantering, and galloping. The walking pace is the one primarily used by the horse, but the horse is often forced to trot, and occasionally is made to gallop, by some necessity. When the horse is made to trot, or to be forced to it, he is said to be "trotting." In trotting, the horse moves its legs in pairs diagonally. Thus, if the left fore and right hind leg be raised, and advanced first, the right fore and left hind leg will be raised the instant the others reach the ground. In fact, in trotting, the first pair are actually raised before the other legs reach the ground, so that there is a minute interval when all four legs are raised above the ground at the same time. The velocity acquired by moving the legs in pairs (as in running), instead of consecutively (as in walking), depends upon the circumstance that in trotting each leg rests on the ground during a short time and swings during a long time, while in walking the swing occupies a short period, and the rest a comparatively long one. In cantering, the animal, after advancing the two fore-legs one after the other, brings forward the two hind-legs simultaneously; and when this movement is greatly urged, the fore-legs are raised together, as well as the hind-legs, and the pace then becomes the gallop. In leaping, the horse raises the fore-legs from the ground, and propels the body upward and forward by the hind-legs alone. This act in the horse is, however, mainly the result of education, and those animals that leap or spring upon their prey (as the members of the cat tribe) crouch before leaping, in order to throw the body forward with the greatest possible force, by first bending all the limbs, and then suddenly extending them. As the hind legs are, however, the essential agents in leaping, we observe that in those animals whose natural mode of progression is leaping—as frogs, lizards, kangaroos, etc.—the hind legs are much longer, and more muscular than the fore-legs. Leaping is a common mode of progression in many short-legged birds (blackbirds, thrushes, finches, sparrows, etc.), in which the step would be extremely short if performed by moving the legs alternately. There is also a large number of insects, such as grasshoppers, fleas, etc., whose ordinary mode of progression is by leaps; and it is in this class of animals that
the leaping power is developed to its greatest extent. The common flea, for example, can leap 200 times its own length. While fleas, locusts, and grasshoppers leap by means of their long and strong hind legs, other insects, as the *podaure*, or spring-tails, possess a forked tail, which they bend beneath the body, and which, when suddenly extended, propels them to a considerable distance.

*Climbing* is merely walking on an inclined or vertical surface. It is usually accomplished by means of sharp nails or claws, as in the cat-trIBE, the lizards, etc. In many birds, as the woodpeckers, parrots, etc., the toes are arranged in two divisions, so as to grasp branches in the manner of a hand. Bears and sloths use their arms for climbing, while monkeys use their hands, and in some cases their tails. It is only in a very few cases, as in the sloth, that this is the ordinary method of progression.

The act of *flying* in the bird is accomplished by the simultaneous action of the two anterior limbs, the wings, much as leaping is by that of the two posterior limbs. See FLYING: BIRDS. Many attempts have been made to estimate the velocity at which different birds can fly. Whether, as has been stated, the eider-duck can fly 90, and the hawk 150 m. in an hour, is very questionable; but it has been ascertained that carrier-pigeons can accomplish from 38 to 42 m. in that time.

The bats are the only mammals which possess a true power of flight. For a description of their organs and mode of flight, we must refer to the article BAT, where will also be found a notice of the false claims of some other mammals, as the so-called flying-squirrel, to the possession of true flight. Similarly, the actions of the flying lizard and of the flying fish are not true flight. In no class of animals is the mechanism of flight so perfect as in insects. The dragon-fly, for example, can outstrip the swallow; and can do more in the air than any bird, as it can fly backwards and sidelong, to right or left, as well as forward without turning. The wings of insects, of which there may be either one or two pair, are analogous (as instruments of motion) to the feathered wings of birds, but are regarded as homologous to (or in their essential nature) branches or respiratory organs. For details regarding the mechanism employed in their aerial progression by insects, see INSECTS.

Swimming is the mode of progression employed by most aquatic animals. It mainly differs from flying in this respect, that water being much more dense than air, and the body of the animal being nearly of the same weight as the water it displaces, very little effort is required to keep the animal from sinking, and hence almost the whole of the muscular force can be employed in progression. In fishes, the locomotive organs consist of the fins and tail, the latter being the great propelling organ. The swimming of a fish has been correctly compared to the motion of a boat propelled by a single oar or scull at the stern. In the same manner as a succession of strokes alternately right and left propels the boat straight forward, so the fish advances by striking alternately right and left with its tail. The caudal fin, in which the tail ends, is vertical in fishes, and is usually considerably forked, when there is great speed. The ventral fins are for the purpose of keeping the fish in its proper position, with the back upwards, as is shown by a well-known experiment of Borelli, who, after cutting off these fins, restored the living fish to the water, when it rolled from side to side like a drunken man. The air-bladder with which many fishes are provided, and which they can distend and contract at pleasure, facilitates their swimming by enabling them to modify their specific gravity. Most terrestrial animals, excepting man, swim at once the first time they find themselves in deep water. The reason of this is, that their limbs move in water precisely as they do on land, and no new action either as regards direction or order is required, as is the case with man, to enable them to swim. Those which frequent the water, as seals, otters, and beavers, have webbed feet like ducks and other palmiped birds, the toes being united by membranes, which, when expanded, act as paddles. A large number of invertebrate animals move chiefly by swimming. Thus lobsters move by means of a vertical motion of the tail, and many of the crabs by means of their posterior legs, which are fashioned like oars. Many insects swim with their legs, which are fringed with hairs to give additional surface. The cuttle-fish uses its long arms as oars, and darts through the water with extreme rapidity; while other mollusks erect sail-like organs, by which they are propelled along the surface of the water. Swimming, as a gymnastic exercise, is described in a separate article.

Notices of the more special modes of progression will be found under a variety of heads. See CRUSTACEA, SERPENTS, WORMS.

**MOTION, in Plants.** See Irritability and Spore.

**MOTIONS, a name given to certain dramatic exhibitions, illustrating scriptural narrative, which prevailed in England in the 15th c. and later.** The characters were represented by wooden puppets, while the dialogue was spoken behind the scenes.

**MOTIVE, or Motivo, in a musical composition, means the principal subject on which the movement is constructed, and which, during the movement, is constantly appearing in one or other of the parts or modified.** In elaborate and long compositions there are also secondary motives.

**MOTLEY, John Lothrop, LL.D., D.C.L., etc., American historian, was b. at Dorchester, Mass., April 15, 1814.** After graduating at Harvard university, he spent a year at Göttingen, another at Berlin, and traveled in Italy and other parts of southern

**U. K. X.—17**
Europe. Returning to America, he studied law, and was admitted to the bar in 1837; but preferring literature, he wrote a historical romance, entitled Morton's Hope (1839), which had little success. In 1840 he received the appointment of secretary of legation to the American embassy to Russia, but soon resigned, and in 1849 published another unsuccessful novel, entitled Merry Mount, a Romance of the Massachusetts Colony. He attracted attention, however, by some valuable historical essays for American reviews, among which may be mentioned one on D. R. Tocqueville's Democracy in America, and another on Motte. Kotmot, having planned a history of Holland, he proceeded to Europe for materials, and after five years' labor, published in 1856 The Rise of the Dutch Republic. In 1860 appeared a continuation of it: The History of the United Netherlands from the Death of William the Silent to the Synod of Dort. Motley was appointed in 1861 U. S. minister at the court of Vienna, a post from which he was recalled in 1867. In 1869 he was sent as minister to the court of St. James, but was recalled the following year. In 1874 he published The Life and Death of John of Barnerebit, Advocate of Holland; with a View of the Primary Causes and Movements of the Thirty Years War (3 vols.). He died May 29, 1877.

MOTMOT. See MOMOTIDAE.

MOTRIL, a town of Spain, in the province of Granada, and 35 m. s. of the city of that name, in a productive district 3 m. from the sea. Agriculture and fishing are the principal employments of the inhabitants. Pop. 14,000.

MOTT, Gerrishom, b. N. J., 1829; served through the Mexican war, and in 1861 raised a regiment of volunteers from his native state. He took part in McClellan's peninsular campaign, was wounded at the second battle of Bull Run, and again at Chancellorville, where he commanded the 2nd N. J. brigade. He was at Gettysburg, and the next year was brevetted maj. gen. In the last campaign against Richmond, he was in command of the 2nd division of the 4th corps. He was made full maj. gen. in 1865.

MOTT, Lucretia, 1793-1859; b. Mass.; married James Mott in 1811. She taught school in Philadelphia in 1817, and the next year became a preacher in the society of Friends. She made a tour through New England and the middle states, preaching, and denouncing slavery and intemperance. "She helped organize the American anti-slavery society in 1833, was a delegate to the 'world's anti-slavery convention' at London in 1840, and participated in the first women's rights convention in 1848. For the rest of her life she continued her advocacy of woman's suffrage and her opposition to slavery. After the division in the society of Friends in 1827, she sided with the Hicksites.

MOTT, Valentine, L.L.D., 1755-1867; b. N. Y.; graduated in medicine at Columbia college in 1806, and afterwards studied in London and Edinburgh. He was appointed professor of surgery in Columbia college in 1809, which place he filled till the medical department of that institution was united with the college of physicians and surgeons in 1813, and for 13 years afterwards. He then, in 1826, with Drs. Hosack, Francis, Mitchell, and others, founded the Rutgers medical college, which, owing to difficulties in regard to its charter was disorganized four years afterwards. He was for several years professor of surgery in the medical department of the university of New York. Dr. Mott was celebrated as a skilful operator in all branches of operative surgery, but more particularly for the ligature of arteries, in which his experience and success was greater than that of any other (see Ligation). He introduced an operation for immobility of the lower jaw, and in 1821 performed the first operation for osteo-sarcoma of that member. He performed the operation of lithotomy 105 times, and amputated more than 1000 limbs. Sir Astley Cooper said of him that he had performed more of the great operations than any man, living or dead. He visited Europe in 1855, and traveled in England on the continent and in the east, publishing an account of his travels in 1842. He was not a voluminous writer, the scalpel being more congenial to his hand than the pen. He, however, found time to translate Velpeau's Operative Surgery (4 vols. 8 vo.) and to furnish several papers or the notes of them for the transactions of the New York academy of medicine. His cliniques were reported by Samuel W. Francis in 1860.

Motte, Rebecca (Brewon), 1740-1815; b. South Carolina; married Jacob Motte, a planter. At the time of the revolution she was a widow, and resided in a house on the Congaree river, which was taken as a garrison by Briti-h soldiers. Through her aid the house was set on fire, and all the garrison captured by Marion and Lee. Her biography may be found in Mrs. Ellis's Women of the Revolution.

Motte (or Motte) Cadillac, Sieur Antoine de la. See Cadillac.

Motteville, Françoise Bertault de, Dame Langlois de, 1621-98; b. France; daughter of a gentleman of the court and the lady's maid of Anne of Austria, whom she succeeded. At the age of 18 she was made to marry de Motteville, who was 80, and died at 82. After his death she seemed never to have a desire for marriage. Brought up at court when Richelieu was its central figure, forced to leave it with Anne of Austria, when the latter was banished from it by that minister, returning at his death; during all the years of her life devoted to her patroness, and to her memory after death she seems in the midst of a court where passions and intrigues were nearly universal, to have kept herself free from all. For this reason the Journal of daily events which she kept during much of her life, written with the straightforward simplicity of
a meditative character which made those quiet observations her pastime, has become one of the most valuable sources of information concerning the characteristics of the court people of her time. It was published in 1723 under the title of Mémoires pour servir à l'histoire d'Anne d'Autriche.

MOTTO, in heraldry, a word or short sentence which forms an accompaniment to a coat-of-arms, crest, or hor bold badge. Mottoes were originally attached to the badge when the family had one, or to the crest where there was no badge. In later heraldry, the practice is to place the motto in an escutcheon either over the crest or below the shield. A motto is sometimes a religious or moral sentiment, as “Gardez la foi,” “Humanitât;” it is not unfrequently a heroic exclamation or war-cry, “Courage sans peur,” “Forward.” In a great many cases it bears reference to the crest, badge, or some bearing of the escutcheon; thus, Stuart, earl of Moray, has for crest a pelican wound- ing herself, and for motto, “Salus per Christum Redemptorem;” and not a few mottoes are punning allusions to the family name—as Sedamore, “Secto amoris Divinii,” Vernon, “Ver non sceler vileet,” “Farce, fac,” for Fairfax, and “Time Deum, cole regem.”

Two mottoes are sometimes used by the same family—one above the crest, the other below the shield. The motto, “Dieu et mon Droït,” which accompanies the royal arms of Great Britain, is supposed to have been a war-cry, and was used in England at least as early as the time of Henry VI. Its origin has been assigned to a saying of Richard I., “Not we, but God and our right have vanquished France.”

MOUFFLON, or MUSMON, Ovis or caprís musimon, the wild-heap or Corsica, Sardinia, Cyprus, Greece, etc. It is about the size of a small fallow-deer, covered with hair and not with wool, except that hair of a somewhat woolly character appears in winter. The upper parts are brownish, the under parts whitish; the hair of the neck is long; the tail is very short. The horns of the male are very large, approaching to those of the argali. The moufflon lives chiefly in the higher parts of mountainous regions, and is not easily approached by the hunter.

MOULD, or MOULDNESS, the name of many minute fungi which make their appearance, often in crowded multitudes, on animal and vegetable substances, either in a decaying or in a living but morbid state. To the naked eye they often seem like patches or masses of fine cobweb, and are discovered by the microscope to consist of threads more or less distinctly jointed, sometimes branched. Some species of mold occur on many different substances; other seem to be peculiar to substances of particular kinds, as decaying pears, decaying gourds, etc. Some of the moulds belong to the suborder of fungi called phlyomycetes. See FUNGI. One of these is the Common MOULD (ascophora mucida), so plentifully found on fruit, paste, preserves, etc., in a state of incipient decay, the progress of which it hastens. It consists of cobweb-like masses of threads, from which rise many short stumps, each bearing at the top a roundish membranous blackish spore-case.—A nearly allied, and also very common species, is ascophora mucida, which forms a bluish mould on bread. From a spreading cobweb-like bed rise long slender branches, terminated by spore-cases, of which the vesicle collapses into the form of a little fleshy—An interesting species of mould, remarkable for its luxuriance and beauty of colors—at first white, then yellow, with orange spore-cases, then shining green or olive, and with threads often several inches long—grows on fatty substances.—Other species of mould are ranked among hypomyctes, a suborder of fungi, having a floccose thallus and naked spores. One of these is the Blue MOULD (aspergillus glauces), which imparts to cheese a flavor so agreeable to epicures, and perhaps marks it as in a condition most suitable for promoting the digestion of other alimentus, of which epicures eat too much. Advantage is often taken of the fact that a small portion of cheese affected with mould will speedily infect sound cheese into which it may be introduced. It is one of the few cases in which the propagation of these fungi is ever desired and sought after by man.—SNOW MOULD (launa minutus) is found on grasses, and especially on barley and rye beneath snow, often destroying whole crops. It appears in white patches of a foot or more in diameter, which finally become red as if dusted with red powder. Even living animals are liable to be injured by fungi of this kind. Silk-worms are killed in great numbers by one called Muscardine (q.v.), or SILK-WORM ROT. Such fungi are sometimes developed on the mucous membrane and in internal cavities of vertebrate animals; and on the bodies of invertebrate animals, as the common housefly, which, in the end of autumn, when it becomes languid, often dies from this cause. Even strongly-scented substances, if moist, are liable to be attacked by mould of one kind or other; nor are strong poisons, either animal or vegetable, a sufficient safeguard.

ASCOPHORA MUCIDA, figura up readily in paste full of corrosive sublimate; and the mycelium of moulds is “sound in strong arsenial solutions. The only sure preventive of mould is dryness. Many of the moulds vegetate is liquids, but do not attain their perfect development, only appearing as filamentous and flocculent mycelia. The ciagur plant (q.v.) is an instance of this kind.

Mildews and moulds are very nearly allied. The rapidity with which these fungi are produced is marvelous. “In favorable circumstances, a plant will pass through every stage of growth to perfect maturation of its
seeds in less than two days, the threads which sustain the ripe sporangia being so long, and yet so delicate, as to make it a marvel that they can remain erect. — (Berkeley.)

**MOULD**, the model or pattern from which workmen execute mouldings, ornaments, etc. Also the shape or bed in which metal and other castings are made.

**MOULD**, JACOB WREY, b. England, 1825; educated in Cork, Ireland, for matriculation at King's college, London, which he entered in 1839, graduating with honors in 1843. He was then apprenticed to the celebrated architect, Owen Jones, and executed with his own hands, from casts or from Mr. Jones's sketches, illustrations of the second volume of *The Alhambra*. Soon after he produced illuminated illustrations for *Gray's Elegies*, the Book of Common Prayer, and a considerable part of Owen Jones's Grammar of Ornament. In 1849 he became associated with Lewis Vullaym a London architect, and the healthiness of his patron designed and erected the beautiful mansion at Stanhope Gate, Hyde Park, London, on the site of the marquis of Hereford's *Gautt House*. After its completion, he was again associated with Owen Jones in the construction and decoration of the Moresque-Turkish divan at Buckingham palace, and in the decoration of the exhibition building of 1851. A few years later he came to the United States and was engaged by Moses II. Grinnell to design and superintend the erection of All Souls (Unitarian) church, on 4th avenue, New York city; a building which, by its departure from previous models in that city, excited lively attention and criticism. In 1857 he was appointed assistant on the architectural staff of the Central Park commissioners, associated with Calvert Vaux, the chief architect. From that time until 1874, Mould, as assistant architect, designed the details of the bridges, terraces and architectural structures in the Central park. In 1879 Mould was made architect-in-chief of the department of public parks, and retained that place until 1884, when he was removed by a change in the style. The same year he was invited to Lima, Peru, to execute architectural work for Henry Meiggs, and was there working out his designs when the death of Meiggs, in 1877, and the war with Chili soon after, necessitated his return to New York in 1879. He has recently (1880) been appointed by the park commissioners of New York city, to design the architectural features of the new Morningside park.

**MOULDING.** See *Founding, ante*.

**MOULDINGS.** The curved and plane surfaces used as ornaments in cornices, panels, arches, etc., and in all enriched apertures in buildings. In classic architecture the mouldings are few in number, and definitely fixed in their forms. There are eight kinds of these regular mouldings, viz, the Cyma, the Ovolo (or Echinus), the Talon, the Cavetto, the Torus, the Astragal, the Scotia, and the Fillet (q.v.); and each of these mouldings has its proper place assigned to it in each order. See *Column*. In Gothic architecture, and all other styles, the mouldings are not reduced to a system as in the Greek and Roman styles, but may be used in every variety of form at the pleasure of the artist. Certain forms generally prevail at one period in any style. Thus, in Gothic architecture, the date of a building may in many instances be determined by the form of the mouldings. The Norman mouldings were very simple in outline, and very frequently enriched with the zigzag and billet ornaments. In the early English style, the mouldings are also simple in outline, and are usually arranged in rectangular divisions, and consist of alternate rounds and hollows. In later examples of this style, the fillet was introduced and led to the more elaborate form of mouldings during the decorated period.

The mouldings of the perpendicular style are generally flatter and thinner than the preceding, and have large hollows separated by narrow fillets, which produce a meager effect. Each of these styles has its peculiar ornaments and style of foliage; and when these are used along with the mouldings, there is no difficulty in determining the approximate date of a building.

**MOULINS.** a t. of France, capital of the department of Allier, on the right bank of the river Allier, here crossed by a handsome stone bridge of 13 arches, lies 213 m. by railway, s.e. of Paris, and 95 m. n.w. of Lyons. Moulins was formerly the capital of Bourbonnais. It is a clean, well-built town, with pretty promenades. The principal buildings are the cathedral of Notre Dame (for the enlargement of which the sum of one and a half million francs was granted in 1853), the museum, the theater, the public library containing 20,000 vols., the new town-house, the palace of Justice, and the college. Of the old castle, built by the due de Bourbon in 1530, only a square tower remains, which is used as a prison. Moulins carries on trade in coal, wood, iron, grain, wine, oil, and cattle. Pop. '76, 31,122.

**MOULMEIN,** a t. in the province of Tenasserim, British Burmah, situated on the gulf of Martaban, in the c. of the bay of Bengal, at the junction of the rivers Sulween, Gynce, and Attaran, in 16° 29' n. lat., and 97° 38' e. long. Moulmein, one of the healthiest stations in India, is a pretty specimen of an eastern town. It is divided into five districts, each of which is under a young or native head of police. The streets are, for the most part, shaded with trees, principally of the acacia tribe, and the glossy jack is often seen half covering a native house, its great fruit, as large as a child's head, ripening in
the sun. The principal street, about 3 m. in length, runs due n. and s., and parallel with the river Salween. The native houses are constructed in the usual Burman style of bamboo, and a thatch made of the leaf of the water-palm. All are raised on piles, according to the universal custom of the country. Men walk about with the grown paper chatthal, or Chinese umbrella, used throughout the provinces; the gharei, or India cab, dashes along, the attendant imp reveling in heat and dust.

Moulmein is backed by a fine range of hills, on whose heights flash the gilded spires of innumerable pagodas; and here, too, are built many pretty residences, commanding a fine view of the town, river, and adjacent country, which for picturesque beauty and varied scenery has few equals. Moulmein boasts various churches, chapels, and missionary establishments, several charitable and educational institutions, substantial barracks, a general hospital, public library, etc. Vessels drawing 10 ft. of water can come up to Moulmein under charge of pilots from Amberst, and at spring-tide ships of any tonnage may reach the town. The rise and fall of the water is at that time from 20 to 23 feet. The population of Moulmein is steadily, if slowly, on the increase. In 1856 it was 43,653; in 1872, it had reached 46,242. Of these, divided according to their religion, about 27,000 were Buddhists, 11,000 Hindus, 6,000 Mussulmans, and 2,000 Christians. The mean temperature of Moulmein for the year 1872 was 78°—the highest being 96° in April, and the lowest 61° in Jan. As to nationality, besides the Burmans proper, the inhabitants of Moulmein include Eurarians or half-castes, Tailens, Chinese, Siames, Karens, Armenians, Jews, Malays, and natives of Hindustan.

Moulmein possesses great facilities for ship-building, and many fine vessels have lately been constructed in the building-yards of Tavoyzoo and Mopoon. The principal exports from Moulmein are teak-timber and rice; the imports consist of general merchandise, chiefly piece-goods, hardware, paper, chemicals, and sundries.

**MOULTING** is the term applied by naturalists to the periodical exuviation, or throwing off of certain structures, which are for the most part of an epithelial or epidermic character. Thus, in a considerable number of the articulata the external covering is thrown off and replaced many times during life. In some of the minute entomostracous crustacea of our pools, a process of moulting, similar to that which occurs in crabs and lobsters, occurs every two or three days, even when the animals seem to have attained their full growth. In the crabs, in which the process has been carefully observed, the exuvium, or cast-off shell, consists not only of the entire external covering, including even the faceted membrane which forms the anterior coat of the compound eyes, but also carries with it the lining membrane of the stomach, and the plates to which the muscles are attached.

During growth this moulting takes place as often as the body becomes too large for the shell; and after the animal has attained its full size it is found to occur at least once a year, at the reproductive season. During the early growth of insects, spiders, centipedes, etc., a similar moulting is frequently repeated at short intervals, but after they have attained their full size no further moulting takes place. In the vertebrata we have examples of as complete a moulting, and replacement of new skin, among frogs and serpents as occurs in the articulata, the whole epidermis being thrown off at least once, and, in some instances, several times yearly. In birds the feathers are periodically cast off and renewed; in mammals generally the hair is regularly shed at certain periods of the year; and in the deer tribe the casting off and renewal of the antlers must be regarded as a special example of moulting. In man the continual exuviation of the outer layers of the epidermis is a process analogous to that which takes place on a more general scale in the lower animals.

**MOULTON, ELLEN LOUISE CHANDLER,** b. Conn., 1835; married William V. Moulton, a Boston journalist, in 1855. Besides many contributions to periodicals, chiefly of fiction and poetry, she has published *This, That, and the Other,* 1854; *Junio Clifford,* 1855; *My Third Book,* 1859; *Bedtime Stories,* 1873; *Some Women's Hearts,* 1874; *More Bedtime Stories,* 1874; *Poesy,* 1877; and *New Bedtime Stories,* 1880.

**MOULTON, JEREMIAH,** 1688–1765; b. Me.; stolen by the Indians while a child, but eventually returned on the release of some Indian prisoners. In 1724 he commanded the forces that captured the town of Norridgewock from the Indians. He was afterwards prominent in Maine as a judge of the court of common pleas.

**MOULTRIE,** a co. in e. Illinois, intersected by the Chicago and Paducah railroad, and the Illinois Midland, with a junction at Lovington, and the Decatur, Mattoon and Southern railroad, connecting with the Chicago and Paducah at Sullivan; 350 sq. m.; pop. '80, 13,705—13,269 of American birth, 16 colored. Its surface is generally level and well timbered, and its fertile prairies are drained by the head waters of the Kaskaskia river. Grain and live stock are the chief products, and it is a good grazing country. Co. seat, Sullivan.
Moultrie, John. 87; b. Long Island; until about 17 years old worked on his father's farm. He was made apprentice to his brother, a sign painter in New York city; displayed a taste for art; entered the school of the academy of design in 1826, and in 1829 began the work of portrait painting in New York. Among his best portraits were those of gen. Jeremiah Johnson and bishop Onderdonk. His greatest success, however, was in depicting humorous scenes and especially those of negro life. His "Rustic Dance," 1829, was very popular, and in 1832 he was made a member of the national academy of design. Among his pictures are "Walking the Crack," "Husking Corn," "Nooning," "Banjo Player," etc.

Mount, William. 87; b. on Long Island, and until about 17 years old worked on his father's farm. He was made apprentice to his brother, a sign painter in New York city; displayed a taste for art; entered the school of the academy of design in 1826, and in 1829 began the work of portrait painting in New York. Among his best portraits were those of gen. Jeremiah Johnson and bishop Onderdonk. His greatest success, however, was in depicting humorous scenes and especially those of negro life. His "Rustic Dance," 1829, was very popular, and in 1832 he was made a member of the national academy of design. Among his pictures are "Walking the Crack," "Husking Corn," "Nooning," "Banjo Player," etc.

Mountaineer. A mountaineer is a person who lives in the mountains. The term "mountain" is also used to refer to a tall hill or large landform that is elevated above its surroundings. The term "mountain" is often associated with rugged terrain, natural beauty, and outdoor activities such as hiking, climbing, and camping. Mountain cultures often have unique traditions and ways of life that are shaped by the physical environment and cultural history of the region. Mountain communities may be characterized by a sense of community, a strong sense of place, and a deep connection to the natural world. Mountain landscapes can vary widely, from the lush forests of the southern Appalachians to the snow-capped peaks of the Rockies. Mountain peoples have adapted to these environments in a variety of ways, developing unique agricultural and ecological practices to thrive in these challenging environments.
MOUNTAIN, George Jeromophath, D.D., D.C.L., 1739-1863; b. England; second son of Jacob Mountain, first Anglican bishop of Quebec; graduated at Trinity college, Cambridge, in 1810. Two years later he took orders and was nominated rector of Fredericton, New Brunswick. One preference after another rapidly followed; and in 1850 he became bishop of Quebec. He spent the greater part of his means in founding Bishop's College, in Lennoxville, Que. Among his published works are Journal of a Northwest American Mission, and Songs of the Wilderness.

MOUNTAIN, Jacob, D.D. 1730-1825; b. in Norfolk, England, educated at Cambridge university; took orders and held in succession the livings of St. Andrews, Buckden, and Holbeach, and was made a canon in the Lincoln cathedral. In 1763 he was nominated to the bishopric of Quebec, and was the first prelate sent to the Canadas by the English church. In the establishment of mission stations and churches he was most active, and took a prominent part in the political affairs of the province.

MOUNTAIN ASH. See Rowan.

MOUNTAIN CORK. See Asbestos, ante.

MOUNTAIN GREEN. See Chrysocolla, ante.

MOUNTAIN LIMESTONE, the basement rock of the carboniferous series in the S. of England and in Wales. It consists of a calcareous rock loaded with marine remains, the greater part of the rock being made up bodily of corals, crinoids, and shells. It has a variable thickness, sometimes reaching as much as 800 feet. In the n. of England and in Scotland, the marine limestones are not separated from, but alternate with, the coal-bearing strata. See CARBONIFEROUS SYSTEM.

MOUNTAIN MEADOWS MASSACRE, an atrocity committed by the Indians in 1857, in Mountain meadows, Santa Clara co., Utah; as is supposed, under the instigation of the Mormon church. A party of 120 emigrant settlers, on their way through Utah to California, had in some way aroused the suspicions of the Mormons, and at the place named were surrounded by Indians under Mormon control, and brutally massacred; only a few children of the party survived. In 1874 an investigation into the affair was ordered by the U. S. government, and John D. Lee, a Mormon bishop, and others, were indicted, tried, and condemned. Lee was executed on Mar. 22, 1877, by being shot on the very spot where the massacre took place.

MOUNTAINS. The number and the altitude of the mountains of the globe are so great that they form almost everywhere prominent objects, and operate to a large extent in modifying the climatic condition of every country in the world. Yet the amount of solid material so raised above the ordinary level of the land is not so much as might be expected. Remembering that elevated plateaus of great extent occur in several regions, and that the general surface of the earth is considerably higher than the sea level, it has been estimated that were the whole dry land reduced to a uniform level, it would form a plain having an elevation of 1800 ft. above the sea. And were these solid materials scattered over the whole surface of the globe, so as to fill up the bed of the ocean, the resulting level would be considerably below the present surface of the sea, inasmuch as the mean height of the dry land most probably does not exceed one-fourth the mean depth of the bed of the ocean.

Mountains, and especially mountain-chains, subserve important uses in the economy of nature, especially in connection with the water system of the world. They are at once the great collectors and distributors of water. In the passage of moisture-charged winds across them, the moisture is precipitated as rain or snow. When mountain-ranges intersect the course of constant winds by thus abstracting the moisture, they produce a moist country on the windward side, and a comparatively dry and arid one on the leeward. This is exemplified in the Andes, the precipitous western surface of which has a different aspect from the sloping eastern plain; and so also the greater supply of moisture on the southern sides of the Himalayas brings the snow-line 5,000 feet lower than on the northern side. Above a certain height the moisture falls as snow, and a range of snow-clad summits would form a more effectual separation between the plains on either side than would the widest ocean, were it not that transverse valleys are of frequent occurrence, which open up a pass, or way of transit, at a level below the snow-line. But even these would not prevent the range being an impassable barrier, if the temperate regions contained as lofty mountains as the tropics. Mountain-ranges, however, decrease in height from the equator to the poles in relation to the snow-line.

The numerous attempts that have been made to generalize on the distribution of mountains on the globe have hitherto been almost unsuccessful. In America the mountains take a general direction more or less parallel to the meridian, and for a distance of 8,500 miles, from Patagonia to the Arctic ocean, form a vast and precipitous range of lofty mountains, which follow the coast-line in South America, and spread somewhat out in North America, presenting everywhere throughout their course a tendency to separate into two or more parallel ridges, and giving to the whole continent the character of a precipitous and lofty western border, gradually lowering into an immense expanse of eastern lowlands. In the old world, on the other hand, there is no single well-defined continuous chain connected with the coast-line. The principal ranges are grouped together in a Y-shaped form, the general direction of which is at right angles to the coa...
world chain. The center of the system in the Himalayas is the highest land in the hemisphere. From this, one arm radiates in a north-east direction, and terminates in the highland at Behring straits; the other two take a westerly course; the one a little to the north, through the Caucasus, Carpathians, and Alps to the Pyrenees; the other more to the south, through the immense chain of Central African mountains, and terminating at Sierra Leone. Most of the principal secondary ranges have generally a direction more or less at right angles to this great mountain tract.

The inquiry into the origin of mountains is one that has received not a little attention. Geologists have shown that the principal agents in altering the surface of the globe are denudation, which is always abrading and carrying to a lower level the exposed surfaces, and an internal force which is raising or depressing the existing strata, or bringing unstratified rocks to the surface. Whether the changes are small and almost imperceptible alterations now taking place, or those recorded in the mighty mountains and deep valleys everywhere existing, denudation and internal force are the great producing causes. These give us two great classes of mountains.

1. **Mountains produced by denudation.**—The extent to which denudation has altered the surface of the globe can scarcely be imagined. All the stratified rocks are produced by its action; but these do not measure its full amount, for many of these beds have been deposited and denuded, not once or twice, but repeatedly before they reached their present state. Masses of rock more indurated, or better defended from the wasting currents than those around, serve as indices of the extent of denudation. The most remarkable case of this kind with which we are acquainted, is that of the three insulated mountains in Ross-shire—Sùil Veinn, Còul Beg, and Còul Mòr—which are about 3,000 ft. high. The strata of the mountains are horizontal like the courses of masonry in a pyramid, and their deep red color is in striking contrast with the cold bluish hue of the gneiss which forms the plains, and on whose upturned edges the mountain-beds rest. It seems very probable, as Hugh Miller suggests, that when the formation of these are relics (at one time considered as old red sandstone, but now determined by Sir Roderick Murchison as being older than Silurian), was first raised above the waves, it covered, with an amazing thickness, the whole surface of the highlands of Scotland. In the Lorn, I pointed to the Maiden Paps of Caithness, but that subsequent denudation swept it all away, except in circumscribed districts and in detached localities like these pyramidal hills.

2. **Mountains produced by internal force.**—These are of several kinds. (a) Mountains of ejection, in which the internal force is confined to a point, so to speak, having the means of exhausting itself through an opening in the surface. The lava, scoriae, and stones ejected at this opening form a conical projection which, at least on the surface, is composed of strata sloping away from the crater. Volcanoes are mostly isolated conical hills, yet they chiefly occur in a somewhat tortuous linear series, on the mainland and islands which inclose the great Pacific ocean. Vesuvius and the other European volcanoes are unconnected with this immense volcanic tract. (b) But the internal force may be diffused under a large tract or zone, which, if it obtain no relief from an opening, will be elevated in the mass. When the upheaval occurs to any extent, the subjacent strata are also raised, and a mountain-chain is the result; but generally one or more series of cracks are formed, and into them igneous rocks are pushed, which, rising up into mountain-chains, elevate the stratified rocks on their flanks, and perhaps as parallel ridges. Thus, the Andes consist of the stratified rocks of various ages, lying in order on the granite and porphyry of which the mass of the range is composed. The position of the strata on such mountains supplies the means of determining, within definite limits, the period of upheaval. The newest strata that have been elevated on the sides of the mountain when it was formed, give a date antecedent to that at which the elevation took place, while the horizontal strata at the base of the mountain supply one subsequent to that event. Thus, the principal chain of the Alps was raised during the period between the deposition of the tertiary and that of the older recent deposits. (c) But there is yet another way in which the upheaving internal force operates, viz., where it does not act at right angles to the surface, but in an oblique direction, it is called the folding or flexure, causing them to rise in huge folds, which, becoming permanent, form parallel ranges of mountains. The crust of the earth, in its present solid and brittle condition, is thus curved, in a greater or less degree, by the shock of every earthquake; it is well known that the trembling of the earth is produced by the progress of a wave of the solid crust; that the destruction of buildings is caused by the undulation; and that the wave has been so evident, that it has been described as producing a sickening feeling on the observer, as if the land were thin ice heaving over water. This mode of mountain formation has been explained when treating of the Appalachians (q. v.), which were thus formed. Many other ranges have had a similar origin, as some in Belgium and in the southern Highlands of Scotland, as has been suggested by Mr. Carruthers.

It is evident that in the last two classes the parallel ridges were produced at the same time. Elie de Beaumont generalized this, maintaining that all parallel ridges or fissures are synchronous; and on this he based a system of mountain-structure, which is too universal and too geometrical to be true. The synchronism of parallel fissures had been noticed by Werner, and it is now received as a first principle in mining. The converse
is also held to be generally true, that fissures differing in direction differ also in age; yet divergence from a center, and consequent want of parallelism, as in the case of volcanoes, may be an essential characteristic of contemporaneity. Nevertheless, Elie de Beaumont classified the mountains of the world according to this parallelism, holding that the various groups are synchronous. The parallelism does not consist in having the same relations to the points of the compass—for these, as regards n. and s., would be far from parallel—but is estimated in its relation to some imaginary great circle, which being drawn round the globe would divide it into equal hemispheres. Such circles he called great circles of reference. But beyond this, he went a step further, and proposed a more refined classification, depending on a principle of geometrical symmetry, which he believed he had discovered among his great circles of reference. It is to be feared, however, that his geographical speculations have little foundation in nature.

MOUNTAINS OF THE MOON, the name of a supposed range of mountains running across central Africa, from the Atlantic to the Indian ocean. The Nile was supposed by the ancient geographers to rise in them. Modern explorations have disproved the existence of any such range. Spedke, in 1858, gave the name to the mountains n. of lake Tanganyika.

MOUNT AUBURN. See CAMBRIDGE, Mass.

MOUNT DESERT, an island in Maine, having Frenchman’s bay and five rocky islands called the Porcupines on the e.; Mount Desert rock 20 m. s. in the open sea; and Soame’s sound flowing up into its s. portion for about six m.; the island being 12 m. in width and 15 m. long; pop. ’80, 1017. It is included in Hancock co., and comprises the towns of Eden, Mount Desert, and Tremont, with 11 postoffices; among them, Soameville, Seal Cove, and East Eden. The Mount Desert postoffice is at Soamesville. The island is one m. from the main land, and has 3 convenient harbors, Bar Harbor, North-east, and South-west. Great Head and Schooner Head are tall cliffs on the s.e. coast. It is crossed by 7 ridges of hills, the highest peak, mount Adam or mount Green, rising to an altitude of 1702 ft. above the level of the sea; and among the mountains are beautiful lakes of considerable size. It is celebrated for the grandeur and beauty of its scenery, and is much frequented as a summer resort. It is 30 m. s.e. of Bangor and was first discovered by the French in 1608, who named it St. Sauveur, but the settlement was destroyed in 1613 by an expedition commanded by Samuel Argall, of Virginia, under the governorship of sir Thomas Dale. The first house of the future permanent settlement was built by Abraham Soames, in the center of the island, overlooking the head of the sound, in 1761. It has excellent public schools, 6 churches, and about 20 hotels. It has a prosperous community engaged in cod and mackerel fishing, the manufacture of lumber, and shipbuilding. A feature of peculiar attractiveness as compared with many sea shore resorts is the combination of mountain and marine scenery.

MOUNTFORD, William, b. England, 1816; educated at Manchester college, York; became a Unitarian minister, and was pastor of a church in Manchester from 1838-41. In 1846 he published a book entitled Martyria, and in 1850, Ethnogenesis, works which gave him some reputation. During 1850 he also visited the United States, and accepted the pastorate of a Unitarian church in Gloucester, Mass. He soon after retired, however, from the ministry, and has since resided at Cambridge, Mass.

MOUNT HOLLY, the seat of justice of Burlington co., N. J., on a branch of the Rancocas creek, which empties into the Delaware river; terminus of two branches of the Pennsylvania railroad, affording two ways of transit to New York city, and one way to Philadelphia; 18 m. s. of Trenton; pop. 5,500. The town is, by artificial means, furnished with gas and water, the latter from a hill 200 ft. high, from which the place takes its name. There are numerous machine shops, foundries, saw-mills, and factories. It has a jail, county buildings, 8 churches, fine schools, two newspapers, and a children’s home.

MOUNT HOLYOKE FEMALE SEMINARY, at South Hadley, Mass., two m. e. of the Connecticut river, and 4 m. s. of the mountain from which it takes its name. Its founder was Miss Mary Lyon, a lady who combined, in an unusual degree, physical, intellectual, and moral strength. During ten years of successful teaching in a private school, her attention was awakened to the importance of establishing a permanent institution for the education of young women, where the expenses should be very moderate and the advantages very great. The problem was difficult. At that time many people thought that for the higher education of girls little more was needed than a superficial acquaintance with a few ornamental branches of study. To a private school that aim was fatal, designed to the daughters of the rich, and district schools sufficed for the rest. Why should colleges be established with faculties, buildings, libraries, cabinets, and apparatus, merely to educate girls? For a long time the public could not be aroused to the importance of the subject. The rich were even more indifferent than the middle classes. But as Miss Lyon thought on the enterprise she became thoroughly absorbed in it, and was willing to spend her life in poverty and toil for its sake. In 1834 she devoted herself to the task. Little by little funds were collected for the first building. Its corner-stone was laid in October, 1836, and the school opened November, 1837. Its principal objects were: 1. To provide for young women with limited pecuniary resources.
Mountmellick.  
Mouza.  

266  
a thorough practical education. 2. To supply, not a preparatory school for younger pupils, but a college for those of maturing years, admitting none under 16 years of age. 3. To educate superior teachers. 4. To arrange the course of study so that they may do the household work themselves, partly in order to reduce expense, but chiefly to teach the dignity of such work and to promote health, cheerfulness, independence, and symmetry of character. These objects have been kept steadily in view, and with great and increasing success through more than 40 years. The prescribed course of study embraced three years, until 1852, when a fourth year was added. There are also optional courses in Greek, German, and French, extending through the four years, which may be pursued in addition to the prescribed studies, but not as substitutes for them. In planning the course the friends of the institution were aware that many pupils would be able to pursue only a part of it. Yet to spend two years, or even one year, in thorough study is a great advantage to those whose means or opportunities allow them no more. Of late years an increased proportion of those who enter complete the course. The graduates, including the class of 1870, number over 1700. Fully three-fourths of the whole number of pupils have engaged in teaching; some as a profession for life, and the rest for transient periods. The terms for board, tuition, and incidentals, have always been as low as was sufficient to cover the ordinary running expenses. At present the sum of $175 per annum includes all charges. The buildings, grounds, library, and apparatus have been furnished chiefly by private benefactions; with the addition of $40,000 granted by the legislature of Massachusetts in 1868, after a careful inquiry into the usefulness of the seminary during the 30 years of its existence. The annual income from payments for board and tuition is about $45,000, in addition to which a small amount is received from invested funds given for specific objects connected with the welfare of the institution. The grounds comprise twenty-one acres of picturesque scenery in which nature has, to some extent, anticipated the work of the landscape gardener. The buildings are: the original main edifice, (enlarged) four stories high, with wings at either end forming with the center a quadrangle; the library, a fire-proof edifice, well arranged and handsomely finished; the Lyman Williston hall, containing well appointed lecture and recitation rooms, a chemical laboratory, cabinets of mineralogy, botany, zoology and geology, and an art gallery, enriched with some superior original paintings by celebrated American artists, and some fine copies of works by old masters; and a temporary observatory, furnished with a good telescope. The library contains 10,500 volumes of very carefully selected works, in English literature, in the French, German, Latin, and Greek languages, and in science and art. The instruction is given by the principal, two associate principals, and twenty-five teachers (all ladies) and by seven gentlemen (distinguished professors in other institutions) who deliver annual courses of lectures in their respective departments. The present number of students (1880) is 236, and the total number of graduates 1704.

MOUNTMELICK, a market-town and seat of poor-law union, in Queen's co., province of Leinster, Ireland. It is situated on the river Oweness, a branch of the Barrow, 47 m. directly w.s.w. from Dublin. The pop. in 1871 was 3,315. The t. has long been a chief seat of the Society of Friends, who established a manufactory of coarse woolen friezes and tweeds, by which many poor children are employed. Mountmellick was also the seat of other manufactories, especially a foundry, a machine-factory, and a beet-root sugar factory, the results of which, however, were disappointing.

MOUNT PLEASANT, seat of justice of Henry co., Iowa, on a branch of the Skunk river, which flows into the Mississippi; on the Chicago, Burlington, and Quincy railroad, 28 m. w.n.w. of Burlington; pop. 4,593. The town contains the state hospital for the insane, the Iowa Wesleyan university, organized in 1853, to which both sexes are admitted, a female seminary, 14 churches, graded public schools, 2 national banks, 2 newspapers, gas works, saw and blind and wagon factories, and a tannery.

MOUNTRAILE, co. Dakota. See MOUNTRAILE.

MOUNT SAINT ELIAS. See ALASKA.

MOUNT VERNON, a t. in s.w. Indiana, on the n. bank of the Ohio river, and on the St. Louis and Southeastern railroad; pop. 70, 2,850. It is the co. seat of Posey co., and a place of considerable trade and river commerce. It is 33 m. w. of Evansville, and 142 m. s.e. of St. Louis. It is delightfully located on table land, commanding an unobstructed view of the river for miles, and has 8 churches, 2 banks (one of them national), 3 weekly newspapers, a court house, and a prayer book, and saw mills.  In the township of East Chester in Westchester co., and is pleasantly situated on the Bronx river, 15 m. from New York, equidistant from the Hudson river on the w. and Long I. and sound on the e. It contains 8 churches, excellent public schools, 2 banks, 3 weekly newspapers, a well-organized fire department, and 4 hotels. The leading industries are the manufacture of pens, horn and rubber jewelry, glue, and carriages.

MOUNT VERNON, a city in Knox co., e. Ohio, a junction of the Cleveland, Mr. Vernon, and Delaware railroad, and the Baltimore and Ohio; pop. 76, 4,876. It is 45 m. n.e. of Columbus, and 25 m. n.w. of Newark. It was set off in 1805, and is delight-
fully located on the sloping bank of the Vernon river to the n. of the stream. The river furnishes extensive water-power, utilized by flour and saw mills, the manufacture of wooden goods, flax, twine, etc. In the city are the railroad repair shops, and manufactories of machinery, steam engines and boilers, furniture, leather, linseed oil, sawdust and doors. It is the center of a considerable trade from the fertile agricultural region in its vicinity. It is lighted with gas, and has 12 churches, excellent public schools, an elegant court-house, a variety of stores, 3 banks (2 of them national), 2 newspapers, and many elegant private residences.

MOUNT VERNON, the seat and tomb of George Washington, first president of the United States of America, on the right bank of the river Potomac, in Virginia, 15 m. below Washington. The residence of Washington, finely situated on the rising bank of the river, and his tomb, with an estate of 200 acres, have been purchased by a patriotic society of ladies, to be kept as a place of public resort, and a memorial of the 'Father of his country.'

MOUNT VERNON (late), the home of George Washington, in Fairfax co., Virginia, on the right bank of the Potomac, 17 m. s. of Washington. The Washington mansion is of wood, 2 stories high, 96 ft. long, and 30 ft. deep. It was built in 1743, by Washington's elder brother, Lawrence, who called it Mount Vernon, after admiral Vernon, under whom he had served in the British navy. It is on a wooded hill from which there is a beautiful view of the Potomac, down to which a lawn of 5 or 6 acres slopes. A high piazza runs along the front of the house, which has 6 rooms of moderate size on the ground floor. They contain many objects of historical interest. The library was designed by Washington himself, but at present contains little of the original furniture. Most of Washington's books are in the possession of the Boston Athenæum. The tomb of Washington is a few hundred yards from the house, near a wooded ravine. The body of Washington was removed thither from the old family vault in 1831. An effort was made in 1832 to secure the removal of the body to the crypt of the capitol at Washington, but the representatives of the family refused. Mount Vernon, which had been much enlarged by Washington, was by him bequeathed to Bushrod Washington, upon whose death it came into the hands of his nephew, John A. Washington, who sold it in 1858 to the Ladies' Mount Vernon association for $200,000, of which $68,104.50 was the contribution of Edward Everett. The association hold the place in trust, as a place of public interest; and upon the dissolution of the association, or its failure to perform the objects for which it was formed, Mount Vernon will revert to the state of Virginia.

MOURNE MOUNTAINS. See Down, County of.

MOURNING, a particular habit worn to express grief, especially for the decease of friends. The usages regarding mourning have varied much at different times and in different countries. Among the Jews, the duration of mourning for the dead was generally 7, but sometimes protracted to 30 days; and the external indications of sorrow consisted in weeping, tearing the clothes, shaving the breast, cutting off the hair and beard, lying on the ground, walking bare-foot, and abstaining from washing and anointing themselves. Among the Greeks, the period was 30 days except in Sparta, where it was limited to 10. The relatives of the deceased secluded themselves from the public eye, wore a coarse black dress, and in ancient times cut off their hair as a sign of grief. Among the Romans, the color of mourning for both sexes was black or dark-blue under the republic. Under the empire, the women wore white, black continuing to be the color for men, who did not cut off the hair or beard as in Greece. Men wore their mourning only a few days; women a year, when for a husband or parent. The time of mourning was often shortened by a victory or other happy public event, the birth of a child, or the occurrence of a family festival. A public calamity, such as a defeat, or the death of an emperor or person of note, occasioned a public mourning, which involved a total cessation of business, called Justitium. In modern Europe, the ordinary color for mourning is black: in Turkey, violet; in China, white; in Egypt, yellow; in Ethiopia, brown. It was white in Spain until 1498. Mourning is worn of different depth, and for different periods of time, according to the nearness of relationship of the deceased. On the death of a sovereign or member of the reigning house, a court mourning is ordered; and in this country, it is usual at the same time to recommend the adoption of a general mourning.

In Scotch law, if a husband die, whether solvent or insolvent, the widow will be entitled to a preferable payment out of the assets for mournings suitable to his rank. And the same privilege applies to mournings for such of the children as are to assist at the funeral. In England, there is no such privilege or distinction.

MOUSA, an island of Shetland, remarkable for an object of antiquity styled Burgh-Mousa, which consists of a round tower of the class known in the north of Scotland as Pliftish towers. Burgh-Mousa occupies a knoll close upon the rocky sea-beach, from which materials for its construction had been taken. The whole fabric is composed of flat slabs of clay-slate, which have been easily piled together in a compact mass without the aid of mortar. The interior figure of the tower is octagonal, inclining inward half-way up, and then bulging out near the top. Near the foundation its circumference is 136 ft., and it measures about 40 ft. in height. On the side next the sea, there is a door-
way, and that is the only exterior aperture. If there were ever any door-posts, they have disappeared; it is feebly conjectured, however, that instead of employing a door, the inmates had, on emergencies, built up the opening, for which there is an abundance of loose materials at hand. Entering the doorway, we find the wall 10 ft. thick, and looking upward, feel as if we were at the bottom of a well, for the circular interior has no flooring, and the top is open to the sky. Opposite the doorway, there is an entrance to a passage and stair which wind upward, within the thickness of the wall, to the summit of the building. At different places there are recesses, or galleries, leading off from the stair, lighted by apertures to the interior; such dismal holes being all that we find in the way of apartments. It is customary to speak of an outer and inner wall; but the two walls, if we so distinguish them, are so firmly bound together by the stiir and otherwise, as to afford a united resistance to assault. Obviously, the structure was used as a retreat in case of attack from foreign enemies, against whom missiles could be showered down from the species of battlements formed by the top of the well-knit walls. According to tradition, the tower of Mouse was occupied by Ear, a Norwegian jarl, in 1154, when it successfully endured a siege that was undertaken to recover a runaway lady; but how any lady could have found accommodation in such miserable quarters, it is difficult to conjecture. The Society of Scottish antiquaries deserves thanks for having repaired this fine memorial of a former state of society in Shetland. From its comparatively complete state, Burgh-Mousa is considered a good specimen of the Pictish towers, so called.

**MOUSE, Mus**, a genus of rodent mammalia of the family Muridae (q.v.), having three simple molar teeth in each jaw, with tuberculated summits, the upper incisors wedge-shaped, the lower compressed and pointed, the forefoot with 4 toes and a rudimentary thumb, the hind foot five-toed; the tail long, nearly destitute of hair, and scaly. This genus includes rats (q.v.) and mice; the smaller species bearing the latter name.—The Common Mouse (*M. musculus*) is perhaps not originally British, although now so abundant everywhere. It accompanies man wherever he goes, and readily colonizes every region, arctic, temperate, or tropical; its great fecundity, common also to most of its conegers, causing means to be employed everywhere for the prevention of its excessive multiplication. Aristotle made the experiment of placing a pregnant female mouse in a closed vessel filled with grain, and found in a short time no fewer than 120 mice in the vessel. Of cats and mouse-traps it seems unnecessary to speak, and equally unnecessary to give a description of the common mouse. There are several varieties of this species. That generally found in houses is smaller, and not so dark in color, as that common in barns and farmyards. A white variety sometime occurs, and has been perpetuated in a half-domesticated state. The common brown kind is, however, at least as easily tamed, and readily becomes familiar enough. A pied variety is not uncommon in India.—Much has been written about the singing powers of the mouse; it being asserted, on the one hand, that mice not unfrequently show a strong love for music, and a power of imitating the song of birds; whilst, on the other hand, it is alleged that the singing of mice is merely the consequence of throat disease.—The mouse makes a nest like that of a bird in the wainscot of a wall, among the chaff or feathers of a bed, or in any similar situation. The litter is generally from 6 to 10 in number.—The Wood Mouse, or Long-tailed Field Mouse (*M. syrichtus*), is a little larger than the common mouse. Its tail is broader; the ears are also longer; its muzzle rather longer; its under parts lighter in color than in the common mouse. It is distributed through Britain and the temperate parts of Europe, and is a grievous pest in gardens and fields. It lays up stores of grain and other food, either in thick tufts of grass, or just under the surface of the earth. The quantity of food laid up in such stores is often wonderfully large. The field mouse is timid, gentle, and easily tamed.—The smallest British mouse, and the smallest British quadruped, is the Harvest Mouse (*M. musserius*), of which the head and body are only ⅝ in. in length, the tail being almost equally long, and to some degree prehensile; the general form elongated and slender, the head narrow, the ears not large. This species is not uncommon in some parts of the south of England; it is also found in the south of Scotland, although less frequently. It makes its nest among the stalks of wheat, reeds, or other grasses, weaving together the leaves and panicles of grasses, the leaves being for this purpose cut into shreds by its teeth. The nest is a very curious structure formed by mere intertwining, without cement of any kind. It is generally suspended among the stalks. It is globular, or nearly so, and entrance to it is through an opening, which almost completely closes up again.—A still smaller species of mouse (*M. pygmaeus*) is found in the south of Europe.—An American species, the White-footed Mouse (*M. leucopus*), common in most parts of North America, and intermediate in its habits between the common mouse and the field mouse, is said to depart from houses whenever either the cat or the brown rat appears in them.—The Barbary mouse (*M. Barbillus*) approaches in size to the rats, and is distinguished by its longitudinally striped fur.

The name mouse is often popularly given to animals considerably different from the true mice, as the rats (q.v.).

**MOUSE-EAR CHICKWEED, Crepis, a genus of plants of the natural order Cynoglossae, having 5 sepals, 5 bifid petals, 10 stamens, 5 styles, and a capsule bursting at the top with 10 teeth. The species are numerous, natives of temperate and cold coun-
tries in all parts of the world. Some of them are among the most common weeds in Britain; others, having larger flowers, are occasionally planted in flower-borders and on rock-works. The form and hairiness of the leaves of some of the British species have given rise to the popular name.

MOUSSeline. See Muslin, ante.

MOUTH. Diseases of the, occur in different forms, but usually begin with inflammation of the mucous membrane. The inflammation may be equally diffused, or may be chiefly or entirely confined to the mucous follicles. When diffused, it may either present no peculiar secreted product, or the surface may be covered with a curd-like secretion, or with patches of false membrane. It may further be attended with eruption, ulceration, or gangrene, any one of which may impress a special character on the disease, or it may present peculiarities from the nature of its exciting cause, as when it accompanies scurvy, or is the result of mercurial action.

The following are the principal forms of inflammation of the mouth, or stomatitis (Gr. stoma, the mouth), as it is termed by nosologists. 1. Common diffused inflammation, which appears in reddened, somewhat elevated patches, and sometimes occupies large portions of the surface of the mouth. It is more commonly a complication of other diseases than an original affection. When of the latter character, it is generally caused by the direct action of irritants, as by scalding drinks, corrosive substances introduced into the mouth, accumulated tartar on the necks of the teeth, etc. In ordinary cases cooling and demulcent liquids (such as cream or almond oil) applied locally, an occasional saline cathartic, with a soft and chiefly farinaceous diet, constitute the whole of the necessary treatment.

2. Diffused inflammation, with curd-like exudation, is almost entirely confined to infants, and is described under its popular name of Thressi.

3. Inflammation of the follicles, and eruption or vesicular inflammation, are described in the article aphthe (q.v.).

4. In ulcerative inflammation, cancerum oris, or canker, an ulceration often of considerable size, with a grayish surface and an inflamed edge, appears on the gums, or inside of the cheeks or lips. The swelling of the adjacent parts is often so considerable as to be apparent externally. There is a copious flow of saliva, and the breath is very offensive. The disease generally occurs in children from 2 to 6 years of age. The ulcer may continue for weeks, or even months, but always yields to treatment. The febrile symptoms and the constipation which are usually present must be combated in the ordinary way. Perhaps the best general method of treating the disease is by the administration of chlorate of potash (4 or 5 grains in sweetened water every 4 hours), and by frequently washing the mouth with a weak tepid solution of chlorinated soda.

5. The preceding affection is sometimes the first stage of a much more serious affection, viz., gangrene of the mouth, which usually occurs in children between the first and second dentition. A sloughing ulcer forms upon the gums, or some other part of the mouth. This slough spreads, the breath becomes extremely fetid, the disease extends to the alveolar processes, and the teeth are loosened and fall out. Inability to take food is followed by exhausting diarrhoea, and death is the usual termination. Unless taken in the early stage, when tonics and the local application of caustics may be serviceable, the disease is generally fatal.

Other affections of the mouth are noticed in the articles Salivation and Scurvy.

MOVABLE FEASTS. See Easter; Festivals, ante.

MOVABLES, in Scotch law, is the technical term to denote personal as contradistinguished from heritable property, one of the main distinctions of property being between these two classes. Heritage goes to the heir-at-law in case of intestacy, or what is equivalent to it, and movables go to the next of kin. See Kin. The term movables is thus not confined to corporeal things, as furniture, cattle, goods, etc., but includes debts, bills of exchange, rights of action, etc.

MOVEMENT CURE, a hygienic and therapeutic system for the preservation as well as the recovery of health, introduced by Peter Henry Ling, a native of Smaland, in Sweden, b. 1766. It is a modified form of gymnastics, and being systematized and specially adapted to the treatment of invalids in a reduced condition, possesses, in many respects, additional advantages to those afforded by ordinary gymnastics. The ancient Greeks and Romans, particularly the former, brought the science of gymnastics, in its purely hygienic relations and as adapted to the development of great strength and agility in healthy constitutions, to a great degree of perfection, as is attested by the power they possessed of performing wonderful feats of strength, endurance, and agility. But their Spartan-like processes would, if practiced upon invalids, particularly of the modern type, promote death rather than recovery. It is probable that the ordinary bodily exertions practiced by a normally educated man employed in active business pursuits are, in general terms, sufficient aids to the stimulation of the other functions of the body; but it must be confessed that normally developed and healthy men are exceptional. Civilization, with its competitions, strikes, and various requirements, has imposed restraints which interfere with and prevent normal development. The practice of ordinary gymnastics, or of the ordinary recreations, such as walking, rowing, boxing, horseshow
ridding, etc., would probably be sufficient for the restoration of functional equilibrium in a person simply jaded by over-work, and this method, because it employs unconscious exertion and perfect relaxation of mind, or essays to do so, is preferable; but, at the same time, it must be acknowledged that in very many cases an individual has formed habits of movement which are more or less abnormal. Many of his muscles, and groups of muscles, from habits formed in the prosecution of his business, have had but very little exercise; they are consequently singularly nourished, and do not eliminate effects matter in a manner suited to the requirements of the nerves which enter them, or of the general nervous system with which they are connected. Under such circumstances exercise requires to be systematized more than it is in the rapid and successive movements which take place in ordinary exercise or labor. The man is like a machine out of order: the mere setting in motion of which, if its parts are not completely derived, will not produce repair. In some instances a patient who might be benefited by partial exercise, would be injured by bringing into action the whole body. These premises being admitted, it will be seen that what is called movement cure can, in many cases where ordinarily healthy persons are undergoing training, be advantageously conjoined with ordinary gymnastics. Ling started a genuine reformation; and he had the approbation of his sovereign in his efforts—a royal ordinance for the establishment of an institution being issued in 1814, and the Swedish government to-day acknowledges the advantages it derives from a governmental institution and from other private establishments of the kind. The natural exercise which is obtained by walking or riding, or moderate gymnastics, ought not to be too readily laid aside for problematical advantages of exercising different muscles of the body. In the course of training or exercise, in the same time, it must be borne in mind that many persons have been injured by over-exertion at the gymnasium. Although, as a general rule, unconscious exercise, such as is taken in genuine recreations, is preferable to that which is forced, it is claimed by those who have practiced the movement cure that there are cases in which conscious and directed movements are more beneficial than those which are unconscious; and this is not an unreasonable conclusion, if such movements are performed so as to render the exercise a diversion. One of the principles of the movement cure is that a muscle or a group of muscles shall not be exercised continuously for a long time, but that there shall be an interval or intervals of rest, during which assimilative nutrition takes place better than when the action is prolonged. Blood is drawn to the part, and during the succeeding resting spell the muscles grow, instead of wasting by continued exertion. Those who have an unbalanced muscular development, no doubt, in walking and riding, often over work one or two weaker muscles, from the effects of which they suffer afterwards in comfort, and miss the securing of the desired harmonious results. When, therefore, it is sought to restore weakened or disused muscles, great care ought to be taken not to over-tax them, but to stop short of fatigue; but this is often incompatible with the taking of a walk or a ride of much length. The more correct physiological plan is, in certain cases, to let the general muscular system remain comparatively quiet, while intermittent and moderate movements are made with the special muscles under treatment. This will tend, after a while, to bring them up to a standard sufficient to enable them to take a fair share with the stronger muscles in the general movement of the body, so that by using the latter rather below their capabilities, and the former just enough for theirs, an equilibrium will at last be brought about. 'To secure this result various devices are practiced, one of the chief principles being that the patient may teach himself, or be taught, how to exercise particular muscles, or sets of muscles, without the aid of any apparatus, but while he is in a natural standing, sitting, or recumbent position, the muscles of the thighs, or of the legs, may be brought into action—and into strong action if it should be desirable—by an effort of the will, and that with scarcely any alteration in the posture. The glutinous muscles are readily brought into action during any position of the body. While lying upon the back, or upon the side, they are readily contracted, and may be held in such a state for any desirable length of time, and at any moment allowed a period of repose for the natural operation of assimilation. This is certainly philosophical practice, and that good results will follow it cannot be denied. The abdominal muscles can very advantageously be set in motion while one is lying upon the back by raising the head from the pillow, and repeating the operation as often as may be thought beneficial. But this exercise is not confined to the abdominal muscles, the pectoral muscles take a certain share, and also the diaphragm; but one peculiar benefit is derived from the stimulus given by the contracted abdomen walls to the involuntary muscles of the alimentary canal, which are usually, in cases calling for this mode of treatment, in a weakened condition. It is commonly asked why physicians do not more often recommend such practice to their patients. A great part of a physician's duty lies in the treatment of acute diseases, which, as a rule, are not susceptible of cure by movements of the muscular system, and will not, in most cases, admit of such practice without hurtful results. When the body is poisoned by disease germs, as in many of the contagious fevers, there is an unnatural performance of functions which is incompatible with much voluntary motion. Sometimes, indeed, passive motion may be made with benefit, such as gently kneading the bowels. But, as a rule, rest, often absolute rest, is required; and, as the conditions of the disease usually involve the loss of some of the mineral constituents of the body, medicines judiciously adminis-
tered are of great importance. There is no doubt of the efficacy of quinine in the treatment of that poisoned condition engendered by miasm, nor of the beneficial effects attending the use of alkaline medicines in many febrile and inflammatory conditions. Many patients would die of gout and rheumatism but for the action of alkalies, and the almost sovereign power, in many cases of gout, of the plant called colchicum. There are conditions of the system in robust as well as delicate persons, when attacked by acute disease, in which the relief afforded by morphine, or some constituent of opium, would appear to be the only means of saving life. The principal occupation, therefore, of the general practitioner is in prescribing the ordinary therapeutic remedies and attending to those directions which concern the immediate necessities of the patient, such as diet, rest, quiet; and there is a temptation to fall into routine habits, but this temptation is not as often yielded to as is supposed, or alleged. Indeed, it is a matter well understood among medical practitioners that, as a rule, it is impossible to prevail upon patients to follow hygienic prescriptions. They are told to ride on horse-back, to walk, to use dumb-bells and Indian-clubs, to go to the gymnasium, or to the movement cure; but they do not obey directions; they have no time. The merchant must attend to his business; his presence is needed on change, and not at the gymnasium, or at the movement cure, or anywhere, dressed in the attire of an athlete, or of an invalid. A lady has a multitude of domestic duties, or, if they are neglected, it is for society and its gayeties, or for pressing demands made upon her for benevolent or charitable work, or for the necessary attentions due to her neighbors and friends. A thousand counter-attractive cause the doctor's injunctions to be disregarded; and is it any wonder that his youthful enrollee, beholding his unexampled, and that, after a while, submits to the necessity of employing such means only as he can carry out to the best advantage? The practice of movement cure is, however, attended with difficulties. There will be an unavoidable tendency to carry speculations and theories to an unwarrantable extent, and to give an indefinite multiplication of movements under an exaggerated idea of their importance, which often results in a want of confidence on the part of the patient in well-established but older methods, and leads him to neglect timely consultation with the general practitioner, or surgeon, in cases requiring active medical or operative surgical interference. On the other hand, there is probably not enough attention paid by many of the medical profession to movement methods of cure in cases of deformities, particularly to those of the spinal column. It would be unjust, however, to infer that such neglect is very prevalent. There are a great many surgeons, who, while not paying sufficient attention to their methods of treating deformities, are in the constant practice of deriving aid from muscular and passive movements of all kinds applicable to each particular case. Indeed, such practice furnishes the basis for the brilliant results which attend the practice of modern surgery, many of which are detailed in the history of cases published in numerous medical journals for the special benefit of the profession, and which are seldom seen by the public.

MOYERS, Franz Karl, 1805-56; b. Westphalia; received his theological education at Münster, where he also pursued the study of the Semitic languages. After being settled for six years over a church in Berkmum, he was appointed professor of theology in the university of Breslau, where he remained till his death. His exhaustive work on the Phenicians, Die Phönizier, appeared in 4 vols. between 1840 and 1856, and is the standard authority upon its subject.

MOVILLE', a small market t. of Ireland, in the county of Donegal, on lough Foyle. 18 m. n.e. of Londonderry. It is a calling-station of the transatlantic steam-packets of the Anchor and Allan lines. Pop. 71, 1205.

MOVING PLANT, Desmodium gyrans, a plant of the natural order leguminosae, sub-order papilionaceae, a native of India, remarkable, as are also some other species of the same genus, for the spontaneous motion of the leaves. The leaves are ternate, the lateral leaflets much smaller than the terminal one. These lateral leaflets are in constant motion, being elevated by a succession of little jerks till they meet above the terminal leaflet, and then moving downwards by similar rapid jerks to the leaf-stalk. Sometimes one leaflet is in motion and the other at rest. Sometimes a few may be seen moving, whilst there is a partial cessation in the other leaves of the plant. A high wind causes this cessation more than anything else; the movements are more languid in a very hot dry day, and are to be seen in their perfection in warm moist weather. The terminal leaflet does not remain absolutely at rest, although its movements are not like those of the lateral ones, but oscillates slowly from one side to the other. Concerning these remarkable movements, nothing more than the fact that they take place can yet be said to be known.

MOWATT, Anna Cora. See Ritchie.

MOWER, a co. in s.e. Minnesota; adjoining Iowa; drained by the Red Cedar, Upper Iowa, and Root rivers; traversed by the Southern Minnesota and Milwaukee and St. Paul railroads; 720 sq. m.; pop. '90, 16,760—11,864 of American birth. The surface is mostly prairie land, and wheat is produced in large quantities. Co. seat, Austin.

MOWER, Joseph A., 1830-70; b. Vt.; received a common education, and learned the trade of a carpenter. He entered the Mexican war as a private in a corps of engineers, and was commissioned as locut. of 1st infantry in 1857; appointed capt. in 1861.
He fought in the early battles of the rebellion in Kentucky and Tennessee; received his appointment as col. of 11th Missouri vol's. in May, 1862; was conspicuous in the capture of Island No. 10; severely wounded at the battle of Corinth, Oct. 4, and for a time in the hands of the enemy; promoted to brig. gen. in Nov., 1862, and commanded a brigade at Vicksburg, where he displayed great bravery. He rose to the rank of maj. gen. in 1864, and commanded a division in Louisiana under gen. Banks; was called to assist Sherman in the Atlanta campaign, and, at the close of the war, was in command of the 20th corps. In 1866 he was appointed col. of 25th infantry, and placed in command in Louisiana, where he remained until his death in New Orleans.

MOWING AND REAPING MACHINES. See Reaping, ante.

MOXА is a peculiar form of counter-irritation which was early practiced in the cast, particularly by the Chinese and Japanese, from whom it was learned by the Portuguese. One or more small cones, formed of the downy covering of the leaves of Artemisia moxα (as used by the Chinese), or of the pith of various plants (as of the common sunflower), or of linen steeped in niter, are placed on the skin over the affected part, and the ends of the remote from the skin are ignited. The combustion gradually proceeds through the cone and forms a superficial eschar on the skin. The surrounding parts must be protected by a pad of wet rag, with a hole in it for the moxα.

It may be employed with advantage in certain forms of neuralgia (especially obstinate sciatica) and in paralysis, and in chronic diseases of the joints. It is not much used in consequence of its apparent severity, but the pain is not so great as might be expected, and, according to some of its advocates, is less than often attends blisters.

Moxos, or Mojos, a nation of Indians in eastern Bolivia; civilized by the missionary fathers, but now much reduced in numbers and property. They have strong features, intelligent faces, and an independent manner; honest and religious; boatmen on the Mamore, the Madeira, and even to the Amazon. Their language was in contact with the Quichua and Aymaran, both of which it resembles. Their early customs show a trace of Guarani influence, and it is probable that they were the farthest tribe in this direction under the control of the Incas.

Moylan, Stephen, 1734-1811; b. Ireland; emigrated to Philadelphia. Soon after the outbreak of the revolutionary war he went to Cambridge, Mass., where the American camp then was, and was selected by Washington as one of his aids-de-camp. He shortly resigned this office and entered the army as a volunteer. He led the 4th regiment in the disastrous campaign in 1777, taking part in the battle of Germantown. He was attached to Wayne's expedition to Bull's ferry in 1780, and was with Greene in the south next year. In 1783 he was brevetted brig. gen. In 1792 and 1793 he was register and recorder of Chester co., Penn., and was afterwards commissioner of the district of Pennsylvania.

Mozambique, a territory on the e. coast of South Africa, nominally belonging to Portugal, and placed under a governor-general, although the actual possessions of Portugal consist only of a few stations, and her authority in the country is inconsiderable. It extends from cape Delgado, in lat. 10° 41' s., to Delagon bay, 26° south. The chief river, the Zambesi, divides it into two portions—Mozambique proper on the n., and Sofala on the south. Area estimated at 288,500 sq. m.; pop. 300,000. These figures, however, are only to be considered approximate, as the country has no definite boundary to the west. The coasts, which comprise large tracts of cultivated soil, yielding rich harvests in rice, are fringed with reefs, islands, and shoals; and between Delagoa bay and cape Corrientes, and from Mozambique, the principal station, to cape Delgado, the shores are high and steep. The forests yield valuable ornamental woods; ivory is obtained from the hippopotami that haunt the marshes; and gold and copper are found and worked. The elephant, deer, and lion inhabit the jungle; crocodiles are found in the rivers, and numerous flamingoes on the coasts. The rainy season lasts from November to March. The summer heat is very great, and the climate, which is fine in the elevated tracts, is unhealthy on the low shores and the swampy districts. Besides numerous fruits and vegetables, the grains are rice, millet, maize, and wheat. The government is in a most inefficient state, being, in most places, more in the hands of native chiefs than of the Portuguese. In former times the slave-trade was carried on here extensively; and from 1846 to 1857 four governors-general were removed by their government for countenancing, if not actively engaging in it. The colony is divided into six districts, and is ruled by the governor-general and his secretary, assisted by a junta. Religion and education are supervised by about 12 Roman Catholic priests, but seem to be at the lowest ebb. Fish and turtle are caught in great quantities on the islands and reefs; pearl-fishing is a source of considerable profit; cattle, sheep, and goats are numerous, and the principal exports are grains, gold-dust, honey, tortoise-shell, cowries, guns, and amber. The Portuguese arrived here in 1497, attracted by rumors of the wealth of the country and the excellence of its ports. The principal settlements are Mozambique, Quelimane, Sena, and Tete.

Mozambique, the capital of the Portuguese territory of the same name, is situated on a small coral island, on the eastern coast of Africa, close to the shore, in lat. 15° 2' south. It is defended by three forts, is well built, and contains a large square in which
the palace of the governor and the custom-house are the chief buildings. Pop. 8,500, of whom 7,000 are slaves, 270 Christians, 102 Banyians from Hindustan, and 1150 Arabs. In former times all the markets of the world were supplied with slaves from Mozambique. Its commerce, now inconsiderable, is chiefly with India, and is carried on by Arabs.

MOZAMBIQUE CHANNEL, between the island of Madagascar and the south-eastern coast of Africa, is about 1000 m., in length, and about 450 in average breadth. At its northern extremity are the Comoro islands. Over the northern portion the monsoons blow. Black whales, yielding spermaceti, abound.

MOZARABIAN LITURGY, a liturgy—traced back by some to the apostles, but by the majority of writers to St. Isidore of Seville, who redacted it, in co-operation with the fathers of the 4th council of Toledo, 633—originally in use among those Christian inhabitants of Spain (Mozarabians, Mostarabians, Mustarabians) who remained faithful to their religion after the Arabic conquest. It is also called the Gothic liturgy, and differs in some respects from the Roman. Gregory VII. first compelled most of the Spanish churches and convents to adopt the common uniform liturgy of the Roman church. Six Mozarabic congregations alone, chiefly in Leon and Toledo, were allowed to retain their ancient ritual, but it soon fell into disuse even among these. Archbishop Ximenes of Toledo expressly founded a chapel at Toledo, in 1500, in which mass was to be said according to the Mozarabian manner, lest it might entirely fall into oblivion. He further caused a number of learned priests, Alfonso Ortiz among them, to compile all the different Mozarabian liturgical MSS. to be found in the different churches, chapels, and convents, and finally there was edited, under his auspices, the Missale Medium secondum Regulam Beati Isidori Dictum Mozarabicum (1500-2), which has, however, by some unfortunate accident, remained incomplete. A whole third of the church-year is left out entirely. The peculiar affinity of this liturgy with the Gallican on the one, and the Greek on the other hand, makes its study extremely important for the history of the ancient church.

MOZART, JOHANN CHRISTOF WOLFGANG GOTTLIER, one of the greatest of musical composers, was b. Jan. 27, 1756, at Salzburg, where his father was sub-director of the archiepiscopal chapel. His extraordinary musical talents were cultivated to the utmost by his father. At the age of four he played the clavichord, and composed a number of minuets and other pieces still extant. When only six years of age his performances were so remarkable that his father took him and his sister, who possessed similar gifts, to Munich and Vienna, where they obtained every kind of encouragement from the court; with the exception of the operas of Mozart, all his compositions, symphonies, concertos, quartets, and six sonatas, and made acquaintance with the works of Handel, recently deceased. Two years later, when but 13 years of age, he composed the music for the religious service, and for a trumpet concert at the dedication of the orphan-house church in Vienna, and conducted it in presence of the imperial court. In 1769, at the age of 13 he was appointed director of the prince archbishop of Salzburg's concerts; and in the same year traveled with his father to Italy, where he created an unheard-of enthusiasm by his performances and compositions. He composed the opera of Midrifiantes at Milan, in Oct., 1770, and it was publicly performed there in December of that year. At the age of 16 he was the first clavichordist in the world; he had produced two requiems and a stabat mater, numerous offertories, hymns, and motets, four operas, two cantatas, 13 symphonies, 24 pianoforte sonatas, not to speak of a vast number of concertos for different instruments, trios, quartets, marches, and other minor pieces. In 1779 he was appointed composer to the imperial court at Vienna, where he then fixed his residence, and there the musical works were composed upon which his great fame chiefly depends. His office in Vienna, however, was rather honorary than lucrative, and he lived by concerts, musical tours, teaching of music, and the small profits derived from the sale of his published works, till an offer of a large salary made to him by the king of Prussia led the emperor to give him 800 florins a year. His great opera of Idomeneo was composed in 1780, with a view to indue the family of Madame Constance Weber, afterwards his wife, to consent to the marriage, which they had declined on the ground of his reputation not being sufficiently established. This opera forms an epoch in the history of music. In construction, detail, instrumentation, and every imaginable respect, it was an enormous advance on all previous works of the kind, and established him as the greatest musician whom the world had seen. Die Entfuehrung aus dem Serail followed. His six quartets, dedicated to Haydn, appeared in 1785, and in 1786 Le Noze di Figaro. In 1787 he produced his chef-d'œuvre, Don Giovanni, which, though received with enthusiasm at Prague, was at first beyond the comprehension of the Viennese. Cosi fan Tutti appeared in 1790. To 1791, the last year of his short life, we owe Zauberflöte, La Clemenza di Tito, and the sublime requiem composed in anticipation of death, and finished only a few days before his decease. He died Dec. 5, 1791, aged 35.

In the intervals of his greater works, Mozart composed the majority of the orchestral symphonies, quartets, and quintets, which are an almost indispensable part of the pro-

U. K. X.—18
gramme of every concert in the present day, besides masses as familiar in England as in Catholic Europe, innumerable pianoforte concertos and sonatas, and detached vocal compositions, all of the most perfectly finished description. To Haydn, Mozart always acknowledged his obligations; but Haydn's obligations to Mozart are at least as great. Haydn, though born 24 years earlier, survived Mozart 18 years, and all his greatest works, written after Mozart's death, bear manifold traces of Mozart's influence. Mozart is the first composer in whose works all traces of the old tonality disappear; he is the father of the modern school. "No composer has ever combined genius and learning in such perfect proportions; none has ever been able to dignify the lightest and tritest forms by such profound scholarship, or, at the moment when he was drawing most largely on the resources of musical science, to appear so natural, so spontaneous, and so thoroughly at his ease." See the Lives by Holmes (Lond. 1845) and Jahn (Leip, 1856). The Life by Kohl (3d. ed. 1875) and the Letters have been translated by lady Wallace.

MOZDOK, a t. and fortress of South Russia, in the government of Caucasus, about 142 m. n. of Tiflis. Pop. '67, 8,513, chiefly Armenians.

MOZIER, Joseph, 1812-70; b. Vt.; removed to New York at 19 years of age, where he engaged in mercantile pursuits from 1831 to 1845, when he abandoned trade and passed the rest of his life in Italy, where he studied art and became a sculptor. His principal works are: 'Esther;' 'The Wept of Wish-ton-Wish;' 'Jephthah's Daughter;' "Pocahontas;" "Rebecca at the Well;" and "Rizpah."

MOLEY, James Bowling, d.d.; b. Lincolnshire, England; graduated at Oriel college, Oxford, in 1834; elected fellow of Magdalen college, and became vicar of Shoreham, Sussex, in 1856; was appointed Bampton Lecturer in 1865; canon of Worcester in 1869; regius professor of divinity, Oxford, in 1871. He is the author of A Treatise on the Augustinian Doctrine of Predestination; Primitive Doctrine of Baptismal Regeneration; Review of the Baptistical Controversy; On Subscription to the Articles; eight lectures on the Atonement; the Bampton Lectures for 1855; Essays, Historical and Theological, with an Introduction and Index of the Author; Retail Ideas in Early Ages; Sermons Periodical and Occasional; Theory of Development; a Criticism of Newman's Essay on the Development of Christian Doctrine; University Sermons, preached before the university of Oxford, and on various occasions.

MOZYR, a t. in the government of Minsk, in Russia, 150 m. s.s.e. of Minsk. It is a town of considerable antiquity, and played a rather important part in the wars between the various Russian princes, previous to the Tartar invasion. It was unsuccessfully besieged by the Tartars in 1240. Under the Polish rule it was the chief town of a district, and remained so after its annexation to Russia in 1795. 150 barges and 200 rafts are annually freighted here with goods to the amount of 500,000 rubles. Pop. '67, 5,250.

MSKET, also written MUCHEIJA, and otherwise, one of the most ancient Georgian towns in the present government of Tiflis, and about 10 m. n.n.w. of the town of that name. It is said to have been the seat of the Georgian kings down to the 6th c., and contained the first Christian church of Georgia, built during the first half of the 4th century. In this church the Georgian kings were crowned and buried. The site of Msket is now marked by a few huts.

MTZENSK, a t. of Russia, in the government of Orel, 416 m. s.s.e. of St. Petersburg. It is situated on the Zusha, which communicates through the Oka with the Volga. The old cathedral, built on a steep rock, gives picturesqueness to the town. Mtsensk receives historical mention as far back as 1147. Its trade, chiefly with St. Petersburg and Moscow, amounts in value to upwards of 1,000,000 rubles. Pop. '67, 13,373.

MUCH WOOLTON (i.e. Great Woolton), a t. of Lancashire, England, 6 m. from Liverpool. The town is rapidly increasing in size on account of the proximity of a branch of the North-western railway, which runs within two miles. Much Woolton has long been noted for gin, some obtained from a neighboring quarry, which gives employment to a considerable number of men. Pop. '71, 4,643. Near Much Woolton is the village of Little Woolton, with a pop. of about 1000.

MUCILAGE, or Bassoria (C₂ₓH₄ₓOₓ), is a modification of gum which is insoluble in water, but when moistened with it, swells up into a gelatinous mass. It is contained abundantly in gum tragacanth; and many seeds, such as linseed, quince seed, etc., and certain roots, such as those of the marsh-mallow, furnish it in large quantity. Alkalis render it soluble in water, and convert it into true gum; and prolonged boiling in water produces the same effect. Nitric acid converts it into mucic and oxalic acids.

MUCITUS, or MUTTES, Scevolà, the name and cognomen of an ancient Roman family, the founder of which was supposed to be the legendary Caius Mucius Scevolà, about 600 B.C.; who after the expulsion of the Tarquins entered the camp of Lars Porsena, their ally, and attempted the assassination of the king; failing in his purpose, and brought before Porsena, to show his contempt for torture he thrust his right hand in the flames and held it there until consumed. The monarch, moved by his courage, released him, and in return Mucius (named Scevolà, left-handed, from this deed) warned him that he was but one of 300 young men sworn to take his life. The result was that Por-

Mucous.

tracts.

red constituent and of most and inner parts that the cavity, which the pancreas) are the skin, mucous membranes, and true glands, all of which are continuous with one another, and are essentially composed of similar parts. As the skin and the glands are described in special articles, it only remains to speak of the great internal mucous tracts. These are the alimentary mucous membrane, the respiratory mucous membrane, and the genito-urinary mucous membrane.

The alimentary mucous membrane commences at the lips, and not only forms the inner coat of the intestinal canal from the mouth to the anus, but gives off prolongations which after lining the ducts of the various glands (the salivary glands, the liver, and the pancreas) whose products are discharged into this canal, penetrate into the innermost recesses of these glands, and constitute their true secreting element. Besides the larger offsets we find in the stomach and small intestine an infinite series of minute tubular prolongations, the anatomical arrangement and function of which are described in the article Digestion.

The respiratory mucous membrane begins at the nostrils, and under the name of Schneiderian or pulvinal membrane, lines the nasal cavities, from whence it sends on either side an upward prolongation through the lachrymal duct to form the conjunctiva of the eye; backwards, through the posterior nares (the communication between the nose and the throat), it sends a prolongation through the Eustachian tube to the middle ear (the cavity of the tympanum), and is continuous with the pharyngeal mucous membrane (which is a portion of the alimentary tract); it then, instead of passing down the esophagus, enters and forms a lining to the larynx, trachea, and bronchial tubes to their terminations. From the continuity of these two tracts, some writers describe them as a single prolongation from the alimentary tract.

The genito-urinary mucous membrane commences at the genito-urinary orifices, lines the excretory passages from the generative and urinary organs, and is the essential constituent of the glands of both. See Kidney, for example.

We thus see that mucous membranes line all those passages by which internal parts communicate with the surface, and by which matters are either admitted into or eliminated from the body. As a general rule, they are soft and velvety, and of a more or less red color, from their great vascularity, but they present certain structural peculiarities according to the functions which they are required to discharge. In all the principal parts of the mucous tracts we find the mucous membrane to present an external layer of
epithelium (q.v.) resting on a thin, transparent, homogenous membrane, which from its position is termed the basement membrane, and beneath this a stratum of vascular tissue of variable thickness, which usually presents either outgrowths in the form of papillae and villi, or depressions or inversions in the form of follicles or glands, or both. The follicles are almost invariably present, but the papilla and villi are limited to the alimentary or gastro-intestinal mucous membrane. "The mucous membranes," says Dr. Carpenter, "constitute the medium through which nearly all the material changes are effected that take place between the living organism and the external world. Thus, in the gastro-intestinal mucous membrane we find a provision for reducing the food by means of a solvent fluid poured out from its follicles; whilst the villi, or root-like filaments, which are closely set upon its surface towards its upper part, are specially adapted to absorb the nutrient materials thus reduced to the liquid state. The same membrane, at its lower part, constitutes an outlet through which are cast out not merely the indigestible residuum of the food, but also the excretions from numerous minute glandula in the intestinal wall, which result from the decomposition of the tissues, and which must be separated from them to prevent further decay. Again, the bronchio-pulmonary, or respiratory, mucous membrane, serves for the introduction of oxygen from the air, and for the exhalation of water and carbonic acid. And, lastly, the mucous membranes are continuous with the cell-lined vesicles or tubes of the various glands, which are the instruments whereby their respective products are eliminated from the blood." Although the various kinds of epithelial cells discharge a special office in relation to the peculiar function of the mucous membrane upon which each kind occurs, yet they all serve one general purpose—namely, that of protecting the surfaces on which they are placed. This protecting power is increased by the presence of the secretion known as mucus, which ordinarily forms an extremely thin layer on these membranes, but when they are irritated or inflamed, is secreted in very considerable quantity. The exact mode of its formation is still a disputed question, but it is generally believed to be the product of the gradual solution of the uppermost epithelial cells. Besides acting mechanically and chemically as a shield to highly sensitive membranes, it has other useful properties. It is not only much more readily attacked by bacteria and protozoa, but especially not by the salivary, and probably to other glands, properties which are not possessed either by itself or by the pure glandular secretions; and 2. It serves to eliminate a considerable quantity of nitrogen from the system. This nitrogen is contained in the muciin, which forms from 2.4 to 9 per cent. of nasal and bronchial mucus. This muciin contains 12.64 per cent of nitrogen, and is the substance which gives to mucus its viscous and tenacious character. Normal mucus is devoid of smell and taste, and almost, if not quite, neutral; and hence its constant presence in the mouth gives rise to no disagreeable sensation.

MUCORINI, an order of fungi very widely distributed, comprising chiefly what are known as the common moulds, which are found on decaying bread and other articles of food, or vegetable or animal matter generally. One species, phlycomyces nitens, grows on greasy substances, a habitat not usual with most fungi. Most members of the order are very small, many of them microscopic. The mucor mucido is one of the most common species and was particularly described by Dr. Brefeld in 1872. Fresh horse-dung kept in a moist place soon becomes covered with white glistening fibers, the mycelium of the mucor mucido. They appear to flourish in decaying matter rich in nitrogen, and evolving ammonia. From the coating there project slight white threads, whose tips soon become black. These are the spore-bearing stalks, or conidia, and they manifest a strong tendency to turn toward the light which is not the case with the spore stalks of the common bread mould, they appearing to be indifferent to light. If the mycelium of the latter is cut or broken into small portions, its spores appear in cloudlike masses. The spores of the cells becomes developed into round bodies resembling spores, which have the power of germination. If the mucor mucido is grown in a dejection of horse dung it bears only conidia. The principal genera are mucor, circinella, helicostylum, thammidiun, chatoystylum, chatochadium, mortierella, pitocephalis, syncephalis, kicxella, cemansia, martensella, and polobus.

MUDAR. Calabropia, a genus of shrubs of the natural order asclepiadaceae, distinguished by a coronet of fine blunt processes adhering to the base of the filaments. They are natives of the East Indies, and the bark of the root, and the inspissated milky juice of some of them, are much used there as an alterative, purgative, emetic, and sudorific medicine. The medicinal properties of mudar have been well known in India for many centuries, and have begun to attract the attention of European physicians. It is found of great value in elephantiasis, and in leprosy and other obstinate cutaneous diseases, as well in some spasmodic affections, and in syphilis.—The species most common in the south of India is C. gigantea; in the north, C. hamiltonii; whilst C. procera, said to have an extremely acrid juice, extends into Persia, and even into Syria. Mudar is very common in India, springing up in uncultivated ground, and often troublesome in that which is cultivated. It is a large shrub, with stems often thicker than a man's leg, and broad fleshy leaves. It grows where almost nothing else will, on very dry sands, and rapidly attains a large size. The silky down of the pods is used for making a soft, cotton-like thread; but is short, and not easily spun. The inner bark also yields a strong
and useful fiber, which makes excellent cordage and fishing-lines; but the mode of preparation hitherto used makes it costly.—The insipidated milky juice of mudar collected by making incisions in the bark, is used as a substitute for caoutchouc and gutta-percha. It becomes flexible when heated.—The mudar of medicine contains a principle called mudarin, on which its medicinal virtues are supposed to depend, and which possesses the rare property of gelatinizing when heated, and becoming fluid when again cooled.

MUD EEL. See SHEN, ante.

MUD-FISH, _amia_, a very curious genus of fishes, forming the family _amidae_ of the order _gonoidei_ of Müller, although its position among the _gonoidei_ is determined only by anatomical characters, in which it agrees with sturgeons and the rest of that order, for the scales are not ganoid, and are not osseous plates, but are flexible and rounded, and destitute of enamel. Similar scales, however, are found in fossil genera regarded by A. Agassiz as ganoid. In habit the mud-fish resembles osseous fishes rather than ganoids. Except in the absence of teeth on the tongue, the bone resembles that of a trout. It is long and flexible, with a bony vertebral column; there are two nasal cirri; the head is flat, covered with a very thin mucus skin, immediately under which the bones appear as sculptured plates. More than ten species are known, natives of the fresh waters of America. The Western Mud-fish (_A. calva_ ) is from a foot and a half to three feet long, bluish-black above, white below. It inhabits the great northern lakes or North America, and is found as far s. as Carolina. It feeds chiefly on crawfish and other crustaceans. It is not esteemed as an article of food, although sometimes used by the Indians.

MUDGE, Benjamin Franklin, b. Me., 1817; graduated at Wesleyan university, 1840; afterwards studied law and practiced in Lynn, Mass., for several years. He became interested in the coal-oil and petroleum trade in Kentucky; was state geologist of Kansas in 1864-65; and the professor of natural sciences in the Kansas agricultural college. He has made several paleontological discoveries.

MUDGE, Enoch, 1776-1856; b. Mass., one of the pioneers of Methodism in New England. He entered the church at the age of fifteen, the Methodist ministry in 1793; traveled and preached in Maine in 1796; resided in Orrington, Me., and was twice chosen state representative. Subsequently he re-entered the itineracy, and was stationed in Boston. In 1832 he was appointed chaplain to the Scamman's Bethel, New Bedford, where he labored with great success until 1844 when on account of ill-health he retired from the ministry. He was highly esteemed as a preacher, fertile in thought, and rich in illustration. He published a volume of sermons for mariners.

MUD-HEN. See Coot, ante.

MUD KI, usually spelled Moonkee, a small t. of n.w. Hindustan, 28 m. s.e. of the Sutlej, and 70 m. s.e. of the city of Lahore, on the Ravi. It has a pop. of about 6,000. Here the first battle in the Sikh war of 1845-46 was fought (Dec. 18, 1845), when the British under sir Hugh Gough repulsed the Sikhs, and sir Robert Henry Sale, "Fighting Bob," was killed.

MÜEDDIN (Müezzin), the Arabic name of the Mohammedan official attached to a mosque, whose duty it is to announce the different times of prayer. His chant (adan) consists of these words, repeated at intervals: "Allah is most great. I testify that there is no God but Allah. I testify that Mohammed is the apostle of Allah. Come to prayer. Come to security." ["Prayer is better than sleep"] is added in the morning, at the sunh or fegr. See MOHAMMEDANISM. Allah is most great. There is no deity but Allah! Besides these regular calls, two more are chanted during the night for those pious persons who wish to perform special nightly devotions. The first (ula) continues, after the usual adan, in this manner: "There is no deity but Allah! He hath no companion—to him belongeth the dominion—to him belongeth praise. He giveth life, and causeth death. And he is living, and shall never die. In his hand is blessing, and he is almighty," etc. The second of these night-calls (ebed) takes place an hour before daybreak, and begins as follows: "I extol the perfection of Allah, the existing for ever and ever, the perfection of Allah, he desired, the existing, the single, the supreme," etc. The office of a müeddin is generally entrusted to blind men only, lest they might, from their elevation, have too free a view over the surrounding terraces and harem. The harmonious and sonorous voices of the singers, together with the simplicity and solemnity of the melody, make a strikingly poetical impression upon the mind of the hearer in daytime; much more, however, is this the case whenever the sacred chant resounds from the height of the mosque through the moonlit stillness of an eastern night.

MÜEZZIN. See MUEDDIN, ante.

MUFTI (Arabic, expounder of the law). The Turkish grand mufti is the supreme head of the ulamas (servants of religion and laws), and has, together with the grand vizier (vizier azim), the supreme guidance of the state, nominally ruled by the sultan. His is the chief spiritual authority, and in this capacity he is also denominated sheikh-ul-Islam (lord of the faith). The imams (priests), however, chosen from the body of the ulamas, are, from the moment of their official appointment, under the authority of the kislaraga, or chief of the black eunuchs. The better class of the ulamas are the teachers and
expounders of the law, from among whom the mollahs and cadis are elected. The Tur- kish laws have their basis in the Koran; the mufli thus, as head of the judges, acquires a spiritual authority. His also is generally the office of guiding the sultan with the sword at his ascension to the throne, a ceremony which takes place at the mosque of Eyubah, and which is equal to our coronation. The mufli is elected and may be deposed by the sultan, and his position has in modern days lost much of its former dignity and importance. His fetwa, or decision, although attached to the imperial decrees, imparts to it but little additional weight. Nor is his own dictum in things spiritual always con- sidered as finally binding. The only prerogative of mufli and ulama which has hitherto remained untouched is their being exempt from bodily or otherwise degrading punish- ments; nor can their property ever be confiscated, but descends to their successors.

MÜGGE, THEODOR, 1806-61, b. Berlin. After devoting himself in early life to mercu- curtain pursuits, at the age of nineteen he started for Peru to serve as a soldier with Bolivar. The news of the expulsion of the Spaniards reached him in London, and he returned to Berlin, where he studied history, philosophy, and the sciences, but lost his chances for a university professorship by the publication in 1831 of France and the East of the Bourbons and England and Reform. His ultra-liberal sentiments, expressed in various newspapers and in his pamphlet Die Glaubwürdigkeiten in Preussen, led in several instances to his arrest and political prosecution. He was associated with the staff of the Zeitung für die Eigne Zeit, and for some time edited the Nationalzeitung, the only liberal journal of Prussia. In 1850 he began the publication of an annual, entitled Vil- Rebellion. During the twenty years preceding his death he poured forth a constant suc- cession of sketches, tales, novels, and romances. His collected works amount to thirty- three volumes. The best known of this last was The Prophet in South Kensington, The Christmas Eve, The Oldest Son of the Family, and the posthumous romance The Prophet. He died in his native city of Berlin, where he occupied a prominent position.

MUGGLETONIANS, a sect that arose in England about the year 1651, and of which the founders were John Reeve and Ludovic Muggleton (b. 1607, died 1697), obscure men, but who claimed to have the spirit of prophecy. Muggleton was a journeyman tailor. He professed to be the "mouth" of Reeve, as Aaron was of Moses. They affirmed that they were the two witnesses of Rev. xi. They asserted a right to curse all who opposed them, and did not hesitate to declare eternal damnation against their adversaries. They favored the world with a number of publications, one of which—particularly directed to the parliament and commonwealth of England, and to his excellency the lord gen. Cromwell—was entitled a Remonstrance from the Eternal God. The prophets were at that time imprisoned as nuisances "in old Bridewell." Another publication was a General Epistle from the Holy Spirit, dated from "Great Trinity lane, at a chandler's shop, over against one Mr. Millis, a brown baker, near Bow Lane end, London." [The first complete edition of Muggleton's works was published in 1756; another edition appeared in 1832.] The Muggletonians denied the doctrine of the trinity; they held anthropomorphist opinions; and to all this they added many strange doctrines of their own, as that the devil became incarnate in Eve, etc. The Muggletonians existed in England as a sect till the time, and, were they one-fourth of the 15 c., had passed away. But the remains of 1551 showed no trace of them, and they are supposed to be now completely extinct.

MUGILID'E. See MULLET, ante.

MUHALITCH, or MUALICH, a t. of Asia Minor, in Anatoliia, 13 m. s. of the sea of Maruora, and 37 m. w. of Brusa, picturesquely situated on low hills. It is large and straggling, contains about 1500 houses and three or four khans, and is the seat of a con- siderable trade, chiefly in exporting silks, wool, and fruits to Constantinople. Pop. 11,000.

MUHESUR, a t. of India, in the territory of Indore (q.v.), on the right bank of the Neroluca, 280 m. n.e. of Bombay. The fort contains many houses within its inclosure, but is in bad repair. There is a new palace, built of gray basalt, and overcharged with sculptures of human beings, and of elephants, tigers, and other animals. There are also numerous and costly Hindu temples, erected by Aliya Bai, relic of Kunda Rao, son of Maharajah Mulhar Rao. The river, which is here about 2000 ft. wide, has a rapid stream of blue water, rushing over a rocky bottom; the banks are 60 or 80 ft. high in the dry season. Access to the water is gained by a ghat, or vast flight of stone stairs, which extends below the water at its lowest level. Pop. about 17,000.

MÜHLBACH, LUISE. See MUNDT, KLARA (MÜLLER).

MUHLENBERG, a t. of Prussian Saxony, situated on the Elbe, 30 m. s.e. of Wittenberg. Pop. 75,317. Here on April 24, 1547, a battle was fought between Johann-Friedrich, elector, and Saxony, and the emperor Charles V.—a battle famous with the Wittenberg results to the empire of Protestantism in Germany. The battle was soon decided in favor of the emperor, Johann-Friedrich was taken prisoner, and his territories were handed over to Maurice, the representative of the ducal family of Saxony. From this time till 1552 the Catholics were triumphant in Germany.

MÜHLENBERG, FREDERICK AUGUSTUS, 1750-1801; b. Penn.; was the son of the rev. H. M. Muhlenberg; educated at the university of Halle; and afterwards
became a Lutheran minister in New York city. In 1779-80 and 1789-97 he was a member of congress from Pennsylvania. He was twice elected speaker of the house.

MÜHLENBERG, GOTTFRIED HEINRICH ERNST, D.D., 1735-1815; b. Penn.; entered the university of Halle at ten years of age, where he remained seven years; afterwards traveled in Germany and England; then returned to America, was ordained a Lutheran minister and became associate pastor of a Lutheran church in Philadelphia, of which his father, Henry Melchior Muhlenberg, the founder of the German Lutheran church in America, was pastor. In 1777, during the occupation of Philadelphia by the British, he retired to the country, where he devoted himself to the study of botany: and it is as a botanist that he is best known. His chief works are, Catalogue Pandura, Americae Septentrionalis, and Descriptis Ultror Grinnelos.

MÜHLENBERG, HEINRICH MELCHIOR, D.D. 1711-1787; b. Einbeck, Hanover, then a free city of Germany. His parents were Saxon, but having suffered greatly in the thirty Years' war removed to Einbeck. His father was a member of the city council, and held a judicial appointment. His mother was the daughter of a retired officer, and a woman of sense, energy, and piety. By them the son was religiously trained. The death of his father occasioned an interruption of his studies. His early life was one of privation and toil. From his 12th to his 21st year he toiled incessantly to assist in the support of the family, yet improved every leisure hour for mental culture and the acquisition of knowledge. At the age of 21 he became tutor in the school of Raphelus at Zellefeld. In 1735 he entered the university of Göttingen, where he remained three years. The influence of Dr. Oporin, who received him into his family, and employed him as an amanuensis, was excellent, and from that time he became an active Christian. Graduating at Göttingen he went to Halle, where, besides studying he taught in the orphan house. He associated intimately with Francke, Celarius, and Fabricius. By their advice he decided to prepare for the missionary work, and Bengal was selected as the field of his operations. Soon after his ordination, and while making arrangements for his departure to India, application came from Pennsylvania to Germany for some one to be sent to labor among the destitute of that colony. The faculty immediately selected Muhlenberg, who was then 26, and in his 28th year. He reached America in 1743, to the great joy of the German Christians. He found the church in a deplorable condition, the Lutheran population having been much neglected. His arrival marked a new era in the history of the Lutheran church in the United States, its condition gradually improved, and frequent accessions were made to the ranks of the ministry, of men educated at Halle, and thoroughly devoted to their work. He took the pastoral care of the associated churches of Philadelphia, New Hanover, and Providence, which had united in calling a minister, and these three congregations were the principal scenes of his ministerial labors, though he preached in all the Lutheran churches of his day, and his aid was often requested from neighboring churches whose differences he seldom failed to reconcile. He often made long journeys to gather the scattered flock, preach the word, administer the sacraments, introduce salutary discipline, and perform other kind services. His influence was unbounded. The first three years of his ministry he resided in Philadelphia, the next 16 in Providence. In 1776 he resumed his charge in the country. During the war of the revolution his sympathy with the colonists excited great opposition, and his life was often in peril. Though advised to remove into the interior from the scene of hostilities, he refused. He was extensively known, and his views were well understood. Many of all classes, taking advantage of his position resorted to his house. "His home," says a contemporary, "was constantly filled with fugitives, acquaintances, and strangers, with the poor and hungry, noble and common beggars. The hungry never went away unsatisfied, nor the suffering uncomforted." At his death there was deep and widespread sorrow. In many places the bells were tolled, the churches shrouded in mourning, and funeral sermons delivered. Dr. Muhlenberg was a man of rare excellence. He possessed a combination of qualities which eminently fitted him for the duties to which he was called. Gifted by nature with great mental powers which were highly cultivated, he devoted himself fully to the fulfillment of his mission. His society was sought by the learned men of the day. The university of Pennsylvania conferred upon him the doctorate in divinity, rarely conferred in those days, and only upon those of unquestioned distinction.

MÜHLENBERG, HENRY AUGUSTUS, 1782-1854; b. Penn.; pastor of a Lutheran church 1802-08. He was a member of congress 1829-38, serving on a number of the principal committees. In 1835 he was an unsuccessful candidate for governor on the democratic ticket. He was offered by president Van Buren the Russian mission, and the post of the secretary of the navy, both of which he refused. In 1838 he accepted the Austrian mission which he held until 1840.

MÜHLENBERG, JOHN PETER GABRIEL, 1746-1807; b. Penn.; son of Dr. Henry M. He was educated at the university of Halle, from which he ran away, and passed a year as a private in the dragoons. He studied for the Lutheran ministry under his father, and was ordained in 1772. He was for a time settled over a church in Woodstock, Va. Soon after the beginning of the revolutionary war, he told his congregation in his last sermon that there was "a time for all things—a time to preach and a time to fight, and that now was the time to fight." At the close of the services, he tore off his gown,
showing himself in full uniform, and read from the pulpit his commission as col. He had the drummers strike up for volunteers, and many of his congregation volunteered and joined his regiment, the 8th Virginia, popularly known as the German regiment, afterwards noted for its courage and good discipline. In 1774 he was a member of the house of burgesses, and served on the committee of safety, and two years later he sat in the state convention. He participated in the fighting at Charleston in 1779, and was made brig. gen. the following year, and placed in command of the Virginia line. He took part in the battles of Brandywine, Germantown, and Monmouth, and in the capture of Stony Point. He defended Virginia against the expeditions of Leslie and Arnold, and was commander-in-chief there till the arrival of Steuben. Upon the invasion of Virginia by Cornwallis, he was next in command to Lafayette, and at the siege of Yorktown he was in command of the 1st brigade of light infantry. He retired at the close of the war with the rank of maj. gen. Soon after he settled in Pennsylvania, to whose executive council he was at once elected, and of which he was elected vice-president in 1785. He served in Congress in 1789-91, 1793-95, and 1799-1801. In the latter year he was elected U. S. senator, and in 1803 he was appointed collector of the port of Philadelphia.

MUHLENBERG, WILLIAM AUGUSTUS, D.D., 1796-1857; b. Philadelphia; graduated at the university of Pennsylvania, 1814; ordained a minister of the Protestant Episcopal church in 1817; in 1817-21 assistant rector of Christ's church, Philadelphia, under bishop White; was rector of St. James's church, in Lancaster, Penn., 1821-28. Here he took an active part in establishing the first public school in the state out of Philadelphia. In 1828 he founded at Flashing, L. I., a school, afterwards called St. Paul's, and of which he was principal from 1815 to 1845. He took an active interest in the Holy Communion in New York, the earliest free Episcopal church. In 1858 he became superintendent and pastor of St. Luke's hospital, in New York, of which he was the founder. He had organized in 1845 the first Protestant sisterhood in the United States, which afterwards was in charge of this hospital. In the latter years of his life he was instrumental in founding an industrial Christian settlement at St. Johnland, L. I., near New York. He was an earnest advocate of Christian union. He was the author of the popular hymns, "I would not live alway," "Like Noah's weary dove," "Shout the glad tidings," and "Savior who Thy flock art feeding." He published Church Poetry, being portions of the Psalms in verse, and hymns suited to the festivals and fasts, from various authors; Music of the Church, in connection with bishop Wainwright; and the People's Psalter. He was a bright example of the mingling of earnest practical philanthropy with fervid devotion, and is held in honor by Christians of every name.

MUHLENBURG, a co. in w. Kentucky, intersected by the Paducah and Southwestern railroad; 576 sq. m.; pop. '80, 15,098—14,976 of American birth, 2,078 colored. In the n. portion the Owensboro' and Nashville railroad terminates at Owensboro' junction, or Stroud City, forming a junction with the Paducah and Southwestern railway. The Green river forms its n.e. boundary, the Muddy river its e., and a branch of the Green river its w. boundary. Its surface is hilly and well wooded, containing lime, chalk, clay, and iron ore, which are extensively mined. Its soil is very productive, and adapted to tobacco, cotton, every kind of grain, and the raising of live stock. It has saw and grist mills, and tobacco factories. County seat, Owensville.

MÜHLHAUSEN, in Alsace-Lorraine. See MÜHLHÄUSEN, ante.

MÜHLHAUSEN, an ancient city of Prussia, in the principality of Eichsfeld, on the Unstrut, 30 m. n.w. of Erfurt. It ranked in the middle ages as an important imperial free city, and is still an active center of commerce. It has manufactories for linen and woolen goods, starch, anise, and saffron works, and carpet and leather factories. Pop. '75, 29,938. Mühlhausen was deprived of its municipal independence in 1803, and made over to Prussia, with which it has since remained incorporated, excepting for a short period during the predominance of French influence in Germany, when, at the suggestion of Napoleon, it was included in the kingdom of Westphalia, but it was restored to Prussia in 1813.

MÜHLHEIM, the name of two manufacturing towns of Rhenish Prussia, distinguished from each other as M. an der Ruhr and M. am Rhein. The former, situated on the river Ruhr, 16 m. n. of Düsseldorf, is a flourishing town, chiefly important on account of its trade in Ruhr coal. Excellent river-steamers are built here. Sandstone is extensively quarried, and iron-works and machine-factories are in operation. Cotton-spinning, weaving, printing, tanning, and paper-making are carried on. Pop. '75, 17,593. Mühlheim am Rheine, carries on extensive manufactures of silk goods (employing 500 looms); there are dye works and paper and oil mills in operation, and considerable trade and commerce. Pop. '75, 17,350.

MUIR, John, b. Glasgow, 1810; educated in the university of Glasgow, and at the East India school at Haileybury, and engaged in the civil service in British India in 1828. He devoted himself to the study of Indian languages, hisatory, geography, and wrote religious tracts in Sanskrit verse. In 1833 he retired from the service and since that time has devoted his time and fortune to the advancement of oriental litera-
ture, especially in its bearing upon Christianity. Having, in 1846, offered to the university of Cambridge a prize of £500 for the best treatise on the errors of the Hindu systems of philosophy, and expounding the principles of Christianity to learned natives of India, he gave, in 1862, £5,000 to the university of Edinburgh for the endowment of a professorship of Sanskrit and comparative philology. He has done much to help the spread of Christianity among the Hindus. He has not only contributed to the transactions of Asiatical and other learned societies, but has published Original Sanskrit Texts on the Origin and History of India, their Religion and Institutions, 5 vols., a work of much learning and very useful to the students of Sanskrit and Indian literature.

MUIRBURN, in Scotch law, is the crime of setting fire to heather. Neither owners nor tenants, except in high and wet lands, are entitled to set fire to heather between April 11 and Nov. 1, though at other times they may. And persons who willfully fire heather are liable to be fined and imprisoned. In England, maliciously setting fire to heaths is one of the heads of the generic offense of arson (q. v.).

MUKDEN, or MOUKDEN, in lat. 41° 50' 30" n., long. 133° 37' e., the capital of Shang-king, the chief province of Manchuria. Its Chinese name is Tungtien-fco, signifying "affluent capital," a translation of the Manchu Mukden, meaning "favouring." It lies on a branch of the river Liao, about 500 m. N.E. of Peking. The town is surrounded by a wall about 10 m. in circumference, including an inner wall 3 m. in circuit, enclosing the emperor's summer residence. Great pains have been taken by the emperors to enlarge and beautify this the metropolis of the Manchu race, but with only partial success. The family residence and place of sepulture of the founders of the reigning dynasty is Hsing-king; about 60 m. E. of Mukden. It is pleasantly situated in a mountain valley near the Opolis which separates the province from Kirin. The emperor Kienlung rendered himself celebrated among his subjects, and the city of Mukden better known abroad by a poetical eulogy upon the city and province, which was printed in 64 different forms of Chinese writing. In 1631 Mukden became the seat of government of the Manchu emperors, and is now the seat of several superior tribunals of a Chinese viceroy of the first rank. Nineteen leagues from Mukden is its port, Niechselang, or Newchwaung (more correctly known as Ying-tz, i.e., "camp" or "military station"), which has been opened recently to foreign commerce. It is shallow, difficult of access, and during many months of the year closed by ice. PULSE, CATTLE, and drugs are its chief exports. The trade with Great Britain is steadily developing, and forms already about one-third of the whole. According to the consular reports for 1875, the total value of the exports for that year amounted to £295,900 (only £13,300 for foreign ports); the total value of imports was £941,500 (£380,000 from foreign countries). Coal and iron are worked in the province, and are beginning to find a market in Newchwaung.

MUKHTAR PASIA, b. in Turkey about 1832, and generally believed to have been a natural son of the sultan, Abdul Medjilid. He was educated at the Constantinople military school; was rapidly promoted and became successively professor and governor of the school. In 1862 he served as a staff officer in the Montenegro campaign, and subsequently in minor troubles with the Arabs. At the breaking out of the Bosnian insurrection he was made governor-general of Bosnia and Herzegovina, where he had some success, but incurred a severe defeat at Duja Pass, and in the Montenegro campaigns of 1876 had, on the whole, but small success. In 1877 Mukhtar had charge of the campaign against Russia in Asiatic Turkey, and on April 29 was defeated and driven from Kars; but in a number of severely contested battles during the next two months, his troops displayed great courage and regained the position. On Oct. 11, the Russians gained an important victory over Mukhtar, driving him back to Kars, and soon afterwards to Erzerum. The fall of Kars practically decided the war, and before the end of the year Mukhtar was recalled, and replaced by Ismail Kurd passa.

MULATTO. See Mixed Races.

MULBERRY, Morus, a genus of trees of the natural order moraceae, natives of temperate and warm climates, with deciduous leaves, unisexual flowers in short, thick spikes, a 4-parted perianth, containing either four stamens or one pistil with two styles, the petals being the small, usually long, and the pistil the short, the pericarp opening by the sepalae or pericarpel into an aggregate fruit.—The common mulberry, or black mulberry (M. nigra), is a native of the middle parts of Asia, but was introduced into the s. of Europe more than a thousand years ago, and is now almost naturalized there. It is a low tree, much branched, with thick rough bark and broad heart-shaped leaves, which are unequally serrated and very rough. It is cultivated in the middle parts of Europe, and succeeds well in the s. of England, but in the northern parts of Britain it requires a wall. The perianth and stigmas are roughly ciliated, and the fruit is of a purplish-black color, with dark red juice, fine aromatic flavor, and subacid sweet taste. The fruit is much esteemed for dessert; an excellent preserve and a pleasant light wine are made of it. The tree often produces its fruit in prodigious quantity. The wood is employed in cabinet-work, but is not of much value. The leaves are sometimes used for feeding of the silkworms. The black mulberry lives long ages still existing in England are known to be more than 300 years old. It is propagated by seed, by suckers, by layers, or by cuttings. It succeeds best in a rich light soil.—The white mulberry (M. alba)
MULDER, Gerard Johannes, a distinguished living chemist, was b. in 1802 at Utrecht, where his father was practicing as a physician. After obtaining the degree of doctor of medicine at the university of his native town in 1825, he commenced the practice of his profession at Amsterdam, where he was appointed to teach botany, and subsequently chemistry, in the newly-established medical school of that city. In 1841 he was elected professor of chemistry at the university of Utrecht. In consequence of the ability he had displayed in various memoirs published in the Dutch scientific journals. He is best known to the general reader as the discoverer of proteine (q.v.), which he maintains to be the main ingredient of albumen, fibrin, casein, etc.; but the existence of which as an independent chemical compound is at the present day not generally admitted. He is the author of numerous excellent works on physiological and agricultural chemistry, on the chemistry of wine and beer, on diet and nutrition, etc., which, in consequence of their being written in Dutch, are far less known in this country than they deserve. His Chemistry of Vegetable and Animal Physiology has been translated into English by Dr. Fronberg, and his Chemistry of Wine by Dr. Bence Jones.

Mule (Lat. mulus, supposed to be connected with Gr. melos, labor, and with Eng. moil), a hybrid animal, the offspring of the male ass and the mare, much used and valued in many parts of the world as a beast of burden. The ears are long; the head, croup, and tail resemble those of the ass rather than those of the horse; but in bulk and stature the mule approaches more nearly to the horse. The mule seems to excel both the ass and the horse in intelligence; it is remarkable for its powers of muscular endurance; and its sure-footedness particularly adapts it to mountainous countries. It has been common from very ancient times in many parts of the east; and is much used also in most of the countries around the Mediterranean sea, and in the mountainous parts of South America. Great care is bestowed on the breeding of mules in Spain and Italy, and those of particular districts are highly esteemed. In ancient times the sons of kings rode on mules, and they were yoked in chariots. They are still used to draw the carriages of Italian cardinals and other ecclesiastical dignitaries. Both in Spain and in South America mules employed to carry burdens are driven in troops, each preceded by an animal—in South America usually an old mare—called the madrina, or godmother, to the neck of which a little bell is attached, and the mules follow with the greatest docility. When troops mingle in their halting-places or elsewhere, they are readily separated, as they recognize at once the sound of their own bell. Mules are comparatively little used in Britain,
although it is alleged that work is done at less expense by the employment of mules than by the employment of horses.

As in other hybrid animals generally, males are more numerous among mules than females, in the proportion, it is said, of two or three to one. There is no instance on record of offspring produced by two mules; but instances occur, although rarely, of their producing offspring with the horse and with the ass. The male is very superior in size, strength, and beauty to the hinny; the offspring of the male horse and the female ass.

**MULE. See SPINNING.**

MULGRAVE, Constantine John PHIPPS, Lord, 1744-92; b. England; son of baron Mulgrave, an Irish peer. He entered the British navy at an early age, and was made post-captain in 1765. He was returned to parliament as member for Lincoln in 1768, and distinguished himself in the debates on libels and on the Westminster election; on the latter subject he published a pamphlet. In 1773 he started, with two ships, on an exploring expedition towards the n.e. Arctic regions, and was stopped by ice at 80° 48 n. lat. He gave an account of this voyage in his *Journal of a Voyage towards the North Pole*, 1774. He was appointed commissioner of the admiralty, and in 1790 raised to the British peerage as baron Mulgrave.

MULGRAVE, Henry PHIPPS, first earl of, viscount Normanby, 1755-1831; b. England; served in the British army through the revolutionary war. He afterwards became a member of Pitt's cabinet, was conspicuous for his opposition to Roman Catholic emancipation, was appointed first lord of the admiralty in 1807, and five years later was made earl of Mulgrave and viscount Normanby.

MULGRAVE, John Sheffield, Earl of. See BUCKINGHAM, or BUCKINGHAMSHIRE, DUKE OF.

MULGRAVE ISLANDS, an archipelago in the Pacific ocean, lying between lat. 3° 8' and 12° n. and long. 160° and 177° e.; composed of the groups of Brown, Raideck, Radack, Scarborough, and Kingsmill. The name is also applied, in a more limited sense, to the small group of the Radack chain, which was examined by H. Percival in 1825. The group forms a circular chain of narrow strips of land, about half a mile wide, enclosing an inland sea 140 m. in circumference. The islands are low and of a coral formation.

**MULHAUSEN (Fr. Mühlhausen), a town of Germany, in the imperial territory of Alsace-Lorraine. Pop. 75, 58,513. Mühlhausen is built on a small island between the Ill and the Rhone and Rhine canals, and is an important station on the Strasbourg and Basel line of railway. It lies in a fertile, well-watered district, and ranks as one of the most active centers of trade in Alsace; while it is also the seat of a tribunal of commerce, and of various mercantile and trade unions, which have exercised a beneficial influence on the industrial activity of the country. Its numerous manufactories produce superior woolen and fine cotton goods, excellent leather, morocco, and carpets; in addition to which, its printing and dye works for cotton, muslin, wool, and silk fabrics are almost unrivalled in regard to the delicacy of the colors and elegance of the patterns employed. Mühlhausen has extensive bleaching-works, and is noted for its cotton and woolen stockings manufactories, its breweries and distilleries, starch and straw works, and for its iron-works, in which locomotives and various forms of steam-engines are extensively manufactured. These manufactures, together with corn, wine, and brandy, form the staple articles of its very extensive trade.**

Mühlhausen early acquired commercial importance, having been erected into a free imperial city by Rudolph of Hapsburg in 1273. By siding with some of the Swiss cantons in the 14th c., it was enabled to maintain a certain degree of neutrality in the feuds between the empire and France. In 1525 Mühlhausen adopted the reformed faith. It retained a part of the circle of the upper Rhine till 1798, when it was incorporated with France. It became a town of the German empire after the war of 1870-71.

**MULL, after the isle of Skye, the largest of the inner Hebrides, belongs to the county of Argyle, and is washed on the w. and s. by the Atlantic, and bounded on the n.e. by the sound of Mull. It is triangular in shape, hollowed on the w. side by an inlet of the Atlantic, and is deeply indented by sea-locks, of which the principal are Loch-na-Keal and Loch Sceadan. Area about 257,000 statute acres, of which 12,470 are arable; pop. 71, exclusive of the neighboring islets, 5,947. Its surface is for the most part occupied by mountains, generally rounded in outline, and rising in Ben More, 3,185 ft. high. Of its fresh-water lakes, Loch Erisa and Loch Ba are the chief. Wood abounds in the north; but owing to the generally tame character of the mountains, the great stretches of moorland, and the absence of well-defined valleys, the scenery, with the exception of that on the coast, is uninteresting. The land under cultivation occurs chiefly on the shores and at the heads of the several lochs. The soil is unusually fertile; but the great humidity of the climate, and the frequency and violence of the gales, render it almost wholly unfit for agriculture. The land is principally laid out in stock-farms, and great numbers of cattle, sheep, and horses are reared and exported. Chief town, Tobermory (pop. 1344), in the north. The harbor of Tobermory is one of the best and safest in the Hebrides. A low-water pier was completed here in Mar., 1864. It enables steamers to land in any state of the tide. The sound of Mull, 20 m. long, by 2
m. in average breadth, separates the island from the mainland of Argyleshire on the north east.

MULLANY, J. R. M., b. N. Y., 1818; entered the navy in 1832, and was made lieut. in 1844. In the Mexican war, he was stationed on the coast of Mexico. He was appointed commander in 1841, and was captain of the Oneida at the battle of Mobile bay, Aug. 5, 1864, was severely wounded, and lost his right arm. He became commodore in 1870, and rear-admiral in 1874.

MULLEIN, a genus of plants (Verbascum) of the natural order scrophulariaceae, consisting of tall, more or less woolly, biennial or perennial herbs with flowers in dense spikes or terminal racemes. Calyx five-parted, corolla somewhat unequally five-lobed, wheel-shaped, five woolly stamens, and a two-celled, two-valved, many-seeded capsule. Three European species, V. blattaria, V. lychnitis, and V. thapsus, have been naturalized in North America, and in Europe the leaves and flowers of two allied species, V. thapsiforme, and V. phlomoides, are also collected. The only species growing in North America which is used in medicine is V. thapsus, the common mullein, so often met in pasture fields and on roadsides. It has leaves from 8 to 12 in. long, the upper ones sessile, and all deciduous, varying in shape from elliptic to oblong and oval-lanceolate; more or less crenate on the margin, and thickly covered with soft white hairs. They have but little smell, are mucilaginous, and have a faintly bitter taste. The corolla and the adorning stamens are the only part of the flower which is collected for the shops generally. The corolla is about 14 in. broad, the three upper stamens having filaments covered with white wool; the two lower ones longer and smooth, with elongated deciduous anthers. The flowers are thoroughly dried and kept in dry, well-stoppered bottles, which preserves their delicate color; dampness causes them to turn dark. Morin obtained from them a trace of a yellowish volatile oil, a fatty substance, sugar, and coloring matter, which is insoluble in ether and cold water, but yields an alcoholic solution which gives a yellow precipitate when treated with a solution of acetate of lead. The leaves (folia verlae) furnish the principal medicinal properties of the plant, but the flowers are used to make poltiques, and the whole flower, with the peduncle, is often used by the Germans to make a gargle for ulcerated sore throat. An infusion of the leaves is used in tachyrrhynchous affections of the respiratory organs and the bowels, and in cystitis; oil impregnated with the volatile oil of the flowers is used in Germany for froth bite and hemorrhoids.

MULLENS, Joseph, D.D., 1830-79; b. London, entered Coward college in 1837, took the degree of b.a. in 1841 at the university of London; was ordained in 1843, and the same year embarked for Calcutta as a missionary of the London missionary society. He prepared statistics of the missions in India and Ceylon, and visited the mission. In 1858 he visited England. In 1865, being invited to be assistant secretary with Dr. Tidman, he returned to England after visiting the missions in India and China. At Dr. Tidman's death he became sole foreign secretary. In 1870 he was sent as a delegate of the London society to the American board. After an absence of 15 months under commission to visit the Madagascar mission, he published Twelve Months in Madagascar. The directors having accepted from Mr. Arthington, of Leeds, in 1875 a liberal offer of help for a new mission on lake Tanganyika, central Africa, Dr. Mullens accompanied the party, to direct the organization of the new mission. Arriving at Zanzibar, he concluded to go into the interior. The exposure and fatigue prostrated him, and he died of peritonitis, July 10. Dr. Mullens received the deeree of d.d. from Williams college, Miss., in 1861, and from the university of Edinburgh in 1868. Besides the work on Madagascar, he published A Brief Review of Ten Years' Missionary Labor in India, between 1853 and 1863; London and Calcutta compared in their Heathenism, Privileges, and Prospects.

MULLER, Charles Louis, b. Paris, 1815; studied art at the school of fine arts, and with Gros and Cogniet. He was director of the Gobelins tapestry factories 1850-58, and became Flindriss's successor at the school of fine arts in 1854. His first exhibited picture was "Christmas Morning" (1837). His greatest work is "The Appeal of the Victims of the Terror." Among his other works may be mentioned "The Martyrdom of St. Bartholomew," "Desdemona," and "Lanjuinais at the Tribune" (1869).

MULLER, Ferdinand von, Baron, b. Germany, 1825; educated at Kiel. He went to Australia in 1847, and for the next 5 years was engaged in botanical explorations. In the latter year he was appointed government botanist of the colony of Victoria. He was director of the Melbourne public garden 1857-73. He is the author of Fragmenta Photographica Australis; Plants of Victoria; Flora Australis, 6 vols.; and other works. The king of Wurttemberg ennobled him, in 1871.

MULLER, Friedrich, a German philologist: b. at Jenaik, Bohemia, 1834; studied in Vienna in 1853-57; was librarian there in 1858-66; became in 1869 professor of comparative philology and Sanskrit at the university, and a member of the academy of sciences. He is considered one of the highest authorities in comparative philology and ethnology, and has contributed largely on the subjects to periodicals. His principal works are Reise der oesterreichischen Freigat Nevarra; Linguistischer Theidr; Ethnographischer Th.; Allgemeine Ethnographie.

MULLER, Friedrich Max (Maximilian), one of the most eminent living orientalists, was born at Dessau, in the duchy of Anhalt-Dessau, Dec. 6, 1829. His father,
Wilhelm Müller distinguished not only for his worth as a man, and his extensive and thorough scholarship, but as one of the first German lyric poets, was librarian of the ducal library, but died prematurely, Oct., 1837. Müller received the elements of his education at Dessau, and then went to Leipsic, where, under prof. Hermann Brockhaus, he began the study of Sanscrit. This he soon chose as his special pursuit; and the first fruits of his labors appeared in a translation of the Hitopadesa (Leip. 1844). In 1844 he went to Berlin to study under Bopp and Shelling, and consult the Sanscrit MSS. to be found there. In Paris, whither he repaired in 1845, he began, at the instigation of Burnouf, to prepare for an edition of the Rig-Veda, with the commentary of Sāyānācārya. With this view he came to England, June, 1846, to examine the MSS. in the East India house, London, and the Bodleian library at Oxford; and, on the recommendation of the late prof. H. H. Wilson, the East India company commissioned him (1847) to edit the Rig-Veda, at their expense. The first volume of this great undertaking, printed at the East India company's press at Calcutta, appeared in 1849; and the work was completed in 1868 and published in 1874. In 1859 Müller was appointed deputy Taylorian professor of modern languages at Oxford; in 1854 he succeeded to the professorship; and in 1858, was elected a fellow of All Souls. While pursuing his labors connected with the Rig-Veda, Müller has published treatises on a variety of philological topics, which have done more to awaken in England a taste for the science of language in its modern sense (see Grammar) than the labors of any other single scholar. Inheriting the poetic imagination and fire of his father, Müller has at command such a felicity of illustration, that subjects dry under ordinary treatment, become in his hands attractive. He has published a translation into German of Kālidāsa's Megha-dīta (König. 1847); The Languages of the Seat of War in the East (2d ed. Lond. 1853); Comparative Mythology (in the Oxford Essays for 1856); History of Ancient Sanscrit Literature (2d ed. Lond. 1860); lectures on The Science of Language delivered at the Royal institution, London, in 1861; a second series, delivered in 1863. In 1868 he delivered the Rede lecture at Cambridge, "On the Stratification of Languages;" and, in 1870, at the Royal institution, London, a course of lectures "On the Science of Religion." Chips from a German Workshop, in 4 vols., were published 1868-75. He is one of the eight foreign members of the institute of France, and has received the degree of L.L.D. from Cambridge and Edinburgh.

MÜLLER, GEORGE, b. Kroppenstädt, Prussia, in 1805; was sent between the ages of 10 and 11 to the cathedral classical school at Halberstadt to prepare for the university. At the age of 15 he left the school and read the classics with Dr. Nagel. After spending 23 years at the gymnasium of Nordhausen, he entered the university of Halle, and obtained permission to preach in the Lutheran church. In 1826 he began preaching, fired with a missionary zeal, and living for two months in free lodgings, provided for poor students in divinity. He wrote to a titled lady of Frankfort of known liberality for a temporary loan; no answer came; but he received the amount asked from some one who had heard of his application, with an anonymous letter written in a very Christian tone. In June, 1828, he was invited to London by the society for promoting Christianity among the Jews, to engage in its service for six months; but, as the Prussian law required from him three years military duty, he was unable to accept. But a severe illness rendering him unfit for military service, he was exempted, and in Mar., 1829, reached London. He studied Hebrew and Chaldee, becoming ill he went to Teignmouth for medical aid. Unable to conform to the discipline of the Jews' society, he ceased to be one of its students in 1830. He then settled as pastor of Ebenezer chapel, laboring also in Bristol. He gave up pew rents, and depended on voluntary gifts, for which a box was placed in the chapel. Often reduced to a few shillings he made known his wants "to the Lord only," and they were supplied. In 1834 he and his co-laborers established the scriptural knowledge institution for home and abroad, "to assist day schools, Sunday-schools, and adult schools, to supply cheap Bibles, and aid missionary societies." In Dec., 1835, after a visit to the continent, he published a proposal for the establishment of an orphan house for destitute children bereft of both parents. In a second statement, dated Jan. 16, 1836, he said: "It is intended to receive the children from the 7th to the 12th year, and to let them stay in the house till they are able to go to service. Spontaneous offers of money and service were received, and the opening of the home was announced May 18, 1836. By May, 1837, there were 64 children in the two houses, and at the end of that year Mr. Müller published the first part of his narrative. At the end of 1838, there were 86 orphans in three houses; at the end of 1839, there were 297. He wrote: "Without any one having been personally applied to for anything by me the sum of £84,441 6s. 2d. had been given to me for the orphans, as the result of prayer to God." He states how this has been expended, and he acknowledges the gifts sent to him for his own use. The number of orphans increased, and the buildings were multiplied until in 1875, "2,000 children were lodged, fed, and educated, without a shilling of endowment, without a committee, without organization, by funds drawn from all parts of the world." In addition to the support of his orphans, Mr. Müller through his institution sustains "numerous foreign and home missionaries and schools, and provides for the circulation of vast numbers of the Scriptures and religious tracts," refusing to make any appeal, or hold any meetings, relying on the efficacy of faith and prayer. Believing that he is an instrument in God's hand, working by faith and prayer, he says he issues no advertise-
MÜLLER, GERHARD FRIEDRICH, 1705-83; b. Germany; educated at Leipzig. Entering the newly established St. Petersburg academy, he gave instruction in history, geography, and Latin, and was soon appointed professor of history. In 1740 he went to Siena, where he was engaged in the study of it and of Italian and Florentine history. On his return, he became historiographer to the empire, and, in 1766, keeper of the national archives. He drew up for the government a collection of its treaties, and wrote a number of works on Russian history, wherein he was the first authority. His most important book, a Collection for the History of Russia, appeared at St. Petersburg, in 9 vols., from 1732 to 1764.

MÜLLER, JOHANN, historian of Switzerland, was b. Jun. 3, 1752, at Schaffhausen, where his father was clergyman and rector of the gymnasium. He studied at Göttingen under Rendle, Schöning, and others. In 1772 he was appointed professor of Greek at Schaffhausen, and in the same year published his first work, Belhern Cimbricum (Zür., 1772). Already he had commenced to devote his leisure hours to the investigation of Swiss chronicles and documents. By the advice of his friend Bonstetten, he went to Geneva in 1774, where he became a private tutor; and also (1778) delivered a series of lectures on "Universal History," afterwards published in 24 volumes. In 1781 he was called to the Collegium Carolinum at Cassel, as professor of statistics, and a little earlier published the first volume of his great work, Geschichte der Schweizer. In 1786 he was appointed librarian and councilor of state to the elector of Mainz; here he finished the 2d volume of his Swiss history; his Darstellung des Fürstentumdes (Leip., 1787); and Briefe zueck Donnerherren (Frankfurt., 1787.). In 1792 he went to Vienna, where the emperor Leopold gave him a situation in the privy council, and, in 1800, appointed him first imperial librarian. In 1804 he left Vienna for Berlin, where he wrote Über die Geschichte der Philosophie (Berlin, 1807), which he held at the University, and the Welt, Vorzeichen und Veränderungen der Vorwelt, and an additional volume of his Swiss history, Introduced to Napoleon after the battle of Jena, he was appointed by him (1807), having been previously dismissed from the Russian service, secretary of state in the new kingdom of Westphalia; but died at Cassel, May 29, 1809. Müller's Sämmtliche Werke were published, 27 vols., Stuttgart, 1810-19; new ed., 40 vols., 1834-35.

MÜLLER, JOHANN, one of the most eminent physiologists of the present century, was b. at Coblenz on July 14, 1801. He began to study with a view to orders in the Roman Catholic church; but in 1819 he abandoned his theological studies and devoted himself to medicine, taking, in 1822, the degree of doctor of medicine at Bonn. Whilst yet a student, he wrote for a prize the treatise De Respiratio Fuitus (Leip., 1823). He became, in 1824, a tutor; in 1826, an extraordinary, and in 1830, an ordinary professor of physiology and anatomy at Bonn; and in 1833 succeeded Rudolph as professor of anatomy at Berlin. His physiological researches were most industriously prosecuted, and were rewarded by many discoveries, which obtained for him a high reputation in the scientific world. He died of apoplexy at Berlin, April 28, 1858. His works are numerous, and many of them occupied with particular topics in zoology and comparative anatomy. Among the most important are—Zur vergleichenden Physiologie des Gesetzesvors der Thiere (Leip., 1828); Grundriss der Vorlesungen über die Physiologie (Bonn, 1837); Grundriss der Vorlesungen über allgemeine Pathologie (Bonn, 1839; De Gallar- tharian Structur derjenigen Nerven primäre Formations in Homine atque Animalibus (Leip., 1830); Über die organschen Nerven der erzten männlichen Geschlechtsorgane, etc. (Berlin, 1825); and Handbuch der Physiologie des Menschen (2 vols., 4th ed., Coblenz, 1874). "Manual of the Physiology of Man," which has been translated into French and English. He was also the author of a large number of dissertations on a variety of subjects connected with physiology, the most important of which have been separately published. His latest investigations, on insuffosia, were published in 1860. The most eminent living physiologists of Germany received his training in his school.

MÜLLER, JOHANN, early German mathematician. See REGIOMONTANUS, ANTE.

MÜLLER, JOHANN FRIEDRICH WILHELM, 1782-1816; b. Germany; studied engraving under his father, Johann Gotthard, at Stuttgart, and at the academy and the Louvre in Paris. In 1806 his engraving of "St. John about to Write His Revelation," after Dom- ced, was the site of a high reputation, which was maintained by his "Adam and Eve under the Tree of Life," after Raphael. In 1814 he was appointed professor of engraving in the Dresden academy, and the rest of his life was devoted to the execution of the plate of his greatest work, the "Madonna di San Sisto," after Raphael's picture of that name, in the Dresden gallery. His engravings are only 18 in number, mostly portraits,
including Schiller, Jerome Bonaparte, the king of Württemberg, the poet Jacoby, and a medallion of Napoleon I.

**MÜLLER, JOHANN GOTTHARD von, 1747–1830:** b. Württemberg; educated at the Stuttgart art academy, where he showed such a talent for design that he was allowed to give his studies for the church, for which he had been intended, and make art his profession. He at first studied under the court painter Gisbal, but, developing a talent for engraving, went to Paris in 1770, where, for six years, he studied under the engraver Wille. There he won a number of prizes, and was elected a member of the French academy. In 1776 duke Karl recalled him to Stuttgart, where he taught for 9 years, when he was summoned to Paris to engrave a portrait of Louis XVI., by Duplessis. Next in importance to this is his engraving of Trumbull’s “Battle of Bunker Hill.” He became professor of engraving on his return to Stuttgart, where his son Johann Friedrich was his most proficient pupil. He was elected a member of the principal European academies, and was knighted in 1818. Besides those mentioned, his best works are a “Madonna della Leggiola;” a “St. Catherine with two Angels,” after Leonardo da Vinci; and a “Schiller;” after the portrait by Goy.

**MÜLLER, JULIUS, a German theologian, was b. at Brieg, April 10, 1801, and was a brother of Charles Otfried Müller (q.v.), the antiquary. He studied at Breslau and Göttingen, at first devoting himself to law, but afterwards to theology. After much mental struggle he adopted religious views opposed to those of the rationalists. In 1825 he was appointed pastor at Schönbrunn and Hosen, near Stralsund, where he remained 7 years. Having acquired a high reputation for theological learning, he was appointed in practical theology and pedagogics. The spirit in which he labored there may be seen from his sermons, entitled *Das Christliche Leben, seine Kämpfe und seine Vollendung* (The Christian Life, its Struggles and its perfection; Bresl. 1834; 3d ed. 1847). In 1834 he became extraordinary professor of theology in Göttingen, and soon after ordinary professor in Marburg, from which he went in 1838 to occupy a similar chair in Halle. The work on which his reputation as a theologian chiefly rests is that on sir, *Die Geschichte der Lehre von der Mitte* (Bresl. 1839; 4th ed. revised and much altered, 2 vols., 1858), which has been translated into English. He afterwards published pamphlets on subjects of temporary interest, particularly in vindication of the cause of evangelical union against the attacks of the rigid Lutherans. He died Sept. 27, 1878. It was he who, in 1850, in conjunction with Neander and Nitzsch, edited a periodical entitled *Deutsche Zeitschrift für Christliche Wissenschaft und Christliches Leben.* He also contributed to the *Theol. Studien und Kritiken.* His work *Die Evangelische Union* appeared in 1854. He died in Oct., 1878.

**MÜLLER, KARL, Otfried, one of the most genial, richly erudite, and industrious classical archaeologists of modern times, was b. Aug. 28, 1797, at Brieg, in Silesia. He was the son of a clergyman, and received a careful education. He studied at Breslau and Berlin. His taste for philological and archaeological studies was early developed. The first fruit of his learning was the publication of the *Aegyptiaca Libri* (Berl. 1847), after which he soon received an appointment to the *Magdaleneum* in Breslau, where his leisure hours were devoted to a grand attempt to analyze the whole circle of Greek myths. In 1819 he obtained an archaeological chair in Göttingen; and to thoroughly prepare his readers for the collections in Germany, France, and England. His grand design was to embrace the whole life of ancient Greece, its art, politics, industry, religion, in one warm and vivid conception—in a word, to cover the skeletons of antiquity with flesh, and to make the dry bones live. With this view he lectured and wrote with a fine earnest animation, until the political troubles in Hanover made his position uncomfortable. He obtained permission to travel, and made tours in Greece and Italy, but unfortunately died of an intermittent fever at Athens Aug. 1, 1840. Müller’s literary and scholarly activity stretched over the whole field of Greek antiquity. We are indebted to him for many new and striking elucidations of the geography and topography, literature, grammar, mythology, manners, and customs of the ancients. His work on the Dorians (*Die Dorier*, translated into English by Sir George Cornwall Lewis and Henry Tuffnell) forms the 21st and 31st vols. of his *Geschichte hellen, Sämme und Staaten* (new and improved ed. 3d ed. 1838; 2 vols., 1844). His *Der Frieden* and *Altertumgeschichte der Macedon. Völke* (Berl. 1825); his *Etrurken* (2 vols., 1829); and his maps of Greece, are works of the highest importance in the departments of ancient history and ethnology. *His Handbuch der Archäologie der Kunst* (Bresl. 1836, 3d ed. 1846; English by Leitch, London, 1859) is full of learning and of acute original observations. His *Prolegomenen zuwacher wissenschaftlichen Mythologie* (Göt., 1825) led the way to a strictly historical explanation of the ancient myths. The work by which he is probably best known in England is his *History of the Literature of Ancient Greece* (Lond. 1840), undertaken at the request of the British “society for the diffusion of useful knowledge.” Müller died before finishing it; what he had finished was translated into English by Sir George Cornwall Lewis and Dr. Donaldson, the latter of whom continued the work from where it left off—at the age of Alexander—to the taking of Constantinople. The German original was published by Müller’s brother (Bresl. 1841). He possessed himself also an acute and judicious critic in his editions of Varro, *De Lingua Latina*; Festus, *De Significatione Verborum*, etc. His contributions to periodicals, encyclopedias, etc., were
MÜLLER, JULIUS, brother of the preceding, was born at Brig, Apr. 10, 1801, educated at Breslau, Göttingen, and Berlin, and after holding several offices, finally became a professor of theology at Halle. His best known work, Die Christliche Lehre von der Sünde (The Christian Doctrine of Sin; English, Edin. 1856), is considered by theological critics the most acute and profound treatise written in modern times on this mysterious subject.

MÜLLER, OTHON FREDERICK, 1730-84: b. Copenhagen; became tutor to a young nobleman, with whom he traveled over Europe, studying natural history. In 1763 he published a work on fungi, which was followed by two works on the insects and plants of the district where he lived. The titles of these works were: Fauna Insectorum Friedrichsaliana, 1764; and Flora Friedrichsaliana, 1767. He was then appointed by Frederick V. of Denmark, to continue the Flora of Denmark, of which work Oeder had published 3 vols. to which Müller added two. In 1771 he published in German a treatise On Certain Essences Inhabiting Fresh and Salt Water. In this work he gives an account of the structure and habits of annulose animals. His Verum Terrestrium et Fluvialium seu Animalium Infusoriorum, Holozinthorum, et Testaceorum non Marinorum, succincta Historia, which appeared between 1773 and 1774, describes the infusory animals, of which he discovered many new species, and which he was the first to divide into genera and species. It also contains a classification of the testaceous mollusces. In his Hydrachna in Aquis Danicie Podstribus Detecta et Descripta, 1785, he describes a large number of minute animals hitherto unknown. In 1777, he published a catalogue of the animals of Denmark, under the title of Zoologica Danica Prodromus. In 1779 he began the publication of his Zoologia Danica, which was intended to correspond in the animal kingdom, with his Flora in the vegetable; but only two parts were ever published. In 1786 was published, edited by his friend Otho Fabricius, a posthumous work on the infusory animals.

MÜLLER, PEDER ERASMUS, 1777-1834: b. Copenhagen; studied at the university there, passing his theological examination 1791. After spending 18 months at some of the German universities he visited France and England. Returning he wrote numerous works, was appointed professor of theology in 1801; bishop in 1822; in 1830 bishop of Zealand, the highest ecclesiastical position in Denmark. He was an eminent theologian, and his theological works on The Christian Moral System; Grounds for Belief in the Divinity of Christianity; Creeds of the Christian Church, all in Danish, are very highly valued; but his literary reputation rests upon his essays on Danish and Norwegian antiquities. Of these the most valuable are, On the Importance of the Iceland Language; On the Rise and Decline of Icelandic Historiography; On the Author of the Edda of Snorri; Critical Examination of the Last Seven Books of Saxo Grammaticus; Critical Examination of the Traditional History of Denmark and Norway; and above all his Sagabibliothek, or Library of the Sagas, 3 vols. In this he gives an analysis of the contents of all the Icelandic sagas or stories now existing. He was the editor in 1805-30 of the Danish Literary Gazette, the oldest literary journal in Denmark, and one of the only three in Europe, which have been continued for a century without interruption.

MÜLLER, SOPHIE, 1803-30: b. Mannheim; a distinguished German actress. She made her first appearance on the stage in her 15th year. She acted at Vienna, Dresden, and Berlin, where her performances were highly applauded. She was also reader to the empress of Austria.

MÜLLER, WILHELM, 1795-1857: b. Germany; educated at the university of Berlin, "where he cultivated philology and early German literature. After serving in the Prussian army through the campaign of 1813, he devoted himself to the study of literature, and especially of early German poetry; as a result of the latter study, his Blumenlese aus den Minnesängern appeared in 1816. It was followed, two years later, by a translation of Marlowe's Doctor Faustus. After spending some time in Vienna, where he learned modern Greek, he made an Italian tour, of which he gave an account in his Rom, Romer, and Romanerinnen. Returning to Germany, he was appointed teacher of classics in the Dessan school, and librarian of the ducal library. His literary reputation was raised to a high pitch by the publication of his Gedichte aus den Historischen Paper en Reisen den Waldhornsten, in 1824, and his Lieder der Griechen the next year. He particularly excelled in the composition of what are called by the Germans Reiselieder or Wanderlieder, lyrics of travel and out-door life. He contributed to Urania, and other periodicals, and to encyclopaedias. He was the father of Max Müller.

MÜLLER, WILLIAM JOHN, 1812-45, b. England; studied landscape under the painter J. B. Pyne, and made a sketching tour through Germany, Switzerland, and Italy. His first exhibited picture of "Peasants on the Rhine" was not successful, and to improve himself in his art he made a long tour through Greece and Egypt, studying the remains of ancient architecture. In 1840 he exhibited at the academy pictures of "Athens" and "Memnon," which showed great progress. Two years afterwards his "Picturesque Sketches of the Age of Francis I." gave him a high reputation. In 1843 he joined sir Charles Fellows in the expedition to bring the Xanthian marbles to London. As a result of this journey he exhibited in the academy of 1845 five pictures: "Head of a Cingari," "Tent Scene," "Turkish Merchants," "The Burial Ground at Smyrna," and
Muller, Mullion.

"Cannon of the Knights Templars." These pictures were hung to such a disadvantage as to escape the attention of most of the spectators; and Muller is said to have died from chagrin in consequence. He exhibited at the British institution, the year of his death, a "Dance at Xanthus," and a "View of Rhodes." Of his other works, some of his earlier landscapes, and his later "Sphinx" and "Prayers in the Desert," deserve mention. His pictures have commanded high prices since his death.

MULLET, Mugil, a genus of cyprinopterous fishes, the type of the family Mugilidae. In this family, the body is nearly cylindrical, the scales are large; there are two widely separated dorsal fins, the first of which has only four stiff, sharp spines; the teeth are extremely fine; the gullet is closed by an extraordinary development of the pharyngeal bones, so that only soft and thin food can pass down it; a branch of the stomach forms a kind of gizzard. The best-known of this family belong to the genus Mugil, of which there are many species. They have a small mouth, with a fold or crest in the under lip, which fits into a corresponding notch in the upper one. The Common Mullet, or Gray Mullet (M. cephalus), a native of the Mediterranean, is distinguished by having the eyes half covered with an adipose membrane, and by a large triangular scale pointing backwards, just over the origin of each pectoral fin. It attains a larger size than the former species, sometimes 10 or 12 lbs. weight. It enters the mouths of rivers at certain seasons, and ascends into the fresh water. It is the most esteemed of all the mullets, and was in great request among the ancients. Enormous prices were given by the Romans for unusually large mullets, the price increasing, like that of diamonds, far more rapidly than the size. Mullets are used fresh, salted, and smoke-dried. A preparation of their roe, called botaraha, is in great esteem as a condiment in Italy and the s. of France. Mullets are often caught in the Mediterranean by angling from a rock, with a bait paste, when they have been previously attracted to the spot by macaroni thrown into the water. A third species of Gray Mullet (M. chelus) is not unfrequent on the coasts of England, and even of Scotland. It is remarkable for its large fleshy lips. It swims in great shoals. In the Mediterranean it sometimes attains the weight of 8 lbs. The American Mullet (M. albus) is very like the common mullet, but more slender, the tall large and forked. It abounds about the Bahama islands, and extends far northwards. It is highly esteemed for the table. The name mullet is also given to the genus Mullus of the family Percidae. See Spermullet.

MULLET, or Mollet, in heraldry, is a charge in the form of a star, generally with five points, intended to represent a spun-rowel, and of frequent occurrence from the earliest beginnings of coat-armour. Gwillim, sir George Mackenzie, and Nisbet lay it down that mullets should always be pierced to represent the round hole in which the spun-rowel turns, but this has been by no means uniformly attended to in practice. Much qualifies this rule. There exists a similarity between mullets and stars; in England the rule most generally adopted is that the mullet has five points, whereas the star has six, unless any other number be specified. Nisbet lays down a canon nearly the converse of this, which has never been adhered to; and in Scottish heraldry the same figure seems to be often blazoned as a mullet or a star, according as it accompanies military or celestial figures. The mullet is the mark of cadency assigned to the third son, "to incite him to chivalry." The word mullet is occasionally used in heraldry for the fish so called.

MULLIDÉE. See Spermullet, aude.

MullinGar, chief t. of the co. of Westmeath, in Ireland, is situated on the great western road from Dublin to Galway, distant from the former, with which it is connected by the Royal canal and the Midland Western railway, 50 m. n.b. Its pop., in 1871, was 5,108, of whom 4,090 were Roman catholics, 886 Protestants of the Episcopal church, the rest members of other denominations. It is the center of a poor-law union of forty-eight divisions, comprising an area of 208,401 acres. Mullin Gar is a place of little historical interest, although its immunities date from the reign of Elizabeth. Its public buildings are in no way remarkable, but it possesses several schools; among the number, one recently endowed for general educational purposes. It is without manufactures, but has considerable celebrity as the site of several of the most important horse and cattle fairs in Ireland.

Mullion, the upright division between the lights of windows, screens, etc., in Gothic architecture. Mullions are rarely met with in Norman architecture, but they become more frequent in the early English style, and in the decorated and perpendicular are very common. They have sometimes small shafts attached to them, which carry the

U. K. X.—19
truthery of the upper part of the windows. In late domestic architecture they are usu-
ally plain.

MULLINS, William, 1575–1621; b. in England, adopted the principles of the Pur-
tans, and with them took refuge first in Holland and then in America. He was a man of wealth, had much influence in deciding upon the movements of the colonists, and was one of the signers of the celebrated compact drawn up on the Mayflower. The severe New England winter proved too much for his health and he died about six months after the landing at Plymouth rock; his wife and children soon followed him, with the exception of a daughter, Priscilla, the heroine of Longfellow's Court-
ship of Miles Standish; and from the marriage of John Alden and Priscilla Mullins are descended a number of eminent men of our own day.

MÜLLNER, Amadeus Gottfried Adolf, 1774–1829, b. in Saxony, took a degree in jurisprudence at Leipsic, and practiced law. He wrote a number of works on legal topics, and also novels and dramas. Two of his dramas, Der Nummndienstzige Feber-
ner and Die Schuld, were once very popular, but are now forgotten.

MULOCK, Dinah Maria. See Craik.

MULREADY, William, R. A., was b. at Ennis, in Ireland, about the year 1786.
When a boy he went to London with his parents; at the age of fifteen entered as a student in the royal academy, and made good progress, aiming at first at the classic style, or what, according to the notions of the day, was called high art. Following the bent of his genius, however, he soon relinquished this course, and devoted himself to the study of nature and the works of those artists who attained high reputation in a pre-
tensions walk of art. His first pictures were landscapes of limited dimension and sub-
ject, views in Kensington gravel-pits, old houses at Lambeth, and interiors of cottages. His next series were large subjects of incidents in every-day life, such as "A Dutch Hotel,
"Horse Racing," the "Barber's Shop," and "Punch" (painted in 1812). "Boys Fish-
ing" (1813), "Idle Boys" (1815). Mulready was elected an associate of the royal academy in Nov., 1813, and an academician in Feb., 1816; a strong proof of the high
estimation in which his talents were held by his brethren, for the higher dignity is rarely
conferred till after a probation of several years as associate. Even in his earliest time
his works were characterized by much elaboration; but those he executed about the middle
period of his career exhibit an extraordinary amount of finish and greater brilliancy of
coloring, qualities that he carried further and further as he advanced in years; and though
he lived to a great age (he died on July 7, 1863), he continued to work with undimin-
ished powers till within a day of his death. A great number of Mulready's best works
now belong to the public, as portions of the Vernon and Sheepshanks' collections. In
the first named there are four pictures, one of these, "The Last In, or Truant Boy,
"exhibited in 1815, being one of the most elaborate works of his middle period; while in
the Sheepshanks' collection there are no fewer than twenty-eight of his works, among
which, "First Love," exhibited in 1814, is a remarkable example of refinement in draw-
ing; and a delicacy of feeling and expression. "The Sonnet," exhibited in 1839, is per-
haps his highest effort in point of style; and by "The Butt—Shooting a Cherry," exhib-
it in 1818, is best exemplified the remarkable minuteness of his finish and richness of
his coloring. An edition of the View of Wakefield, published in 1810, by Van Voorst,
embellished with twenty wood-cuts from Mulready's drawings, is a very fine work.
"Women Bathing" was exhibited in 1849; and, in 1852, "Blackheath Park." "The Toy
Seller," a large picture exhibited the year before he died, was unfinished, and not
at all equal to earlier and smaller ones, but remarkable as the work of a man whose
artistic efforts had been landed sixty years before.

MULTAN, or Moobtan, an ancient and important city of India, in the Punjab, on
a mound consisting of the ruins of ancient cities that occupied the same site, three miles
from the left bank of the Chenab—the inundations of which sometimes reach Multan—
and 200 m. s.w. of Lahore. It has railway communication with all the principal towns of
India—Calcutta, Bombay, Madras, Peshawar, etc. The city is surrounded by a dilapi-
dated wall, from forty to fifty ft. in height, The vicinity abounds in mosques, tombs,
shrines, etc., attesting alike the antiquity and magnificence of the former cities; and the
country around is remarkable for its fertility. Mulltan is a military station, with a small
redoubt in the rear of the cantonment. Its bazaars are numerous, extensive, and well
stocked; and its shops, 6,000 in number, are well supplied with European and Asiatic
commodities. Manufactures of silks, cottons, shawls, scarfs, brocades, tissues, etc., are
carried on, and there is an extensive banking trade. The merchants of Multan are pro-
verbially esteemed extremely rich. Steamers ply between this city and Hyderabad, a
distance of 570 m.; and the Indus Valley railway opens up a commercial outlet from
central Asia, the Punjab, and the North-West provinces, to the Arabian sea by Hyderabad
and Karachi. In 1849 Multan was taken by the British troops under gen. Whish, and
annexed with its territory to the British possessions. The pop. of Multan in 1858 was
56,836.

MULTIPLE-POINING is a well-known form of action in Scotland, by which com-
peting claims to one and the same fund are set at rest. It means double poining or
double distress, suggesting that a person who has funds in his possession is liable to be
Mullins, Mummy.

harassed by double distress; and hence he commences a suit called the action of multiple-pointing, by which he alleges that he ought not to be made to pay the sum more than once; and as he does not know who is really entitled to payment, he cites all the parties claiming it, so that they may fight out their claims among themselves. The suit corresponds to what is known in England as a bill or order of interpleader.

MULTIPLICATION, the third and most important of the four principal processes of arithmetic, is a compendious mode of addition, when a number is to be added to itself a given number of times. The third term of a multiplication are the multiplicand, or number to be multiplied; and the product, giving the amount which would be obtained if the multiplicand were added to itself the number of times denoted by the multiplier. The symbol of multiplication is \( \times \); and in arithmetic the numbers are placed above each other as in addition, with a line drawn under them; in algebra the quantities are merely placed side by side, with or without a dot between them—e.g., the multiplication of 2 by 4 may be written \( 2 \times 4 \), and of \( a \) by \( b \), \( a \times b \), \( a, b \), or \( ab \). For multiplication of fractions, see Fractions.

The operation of multiplication has been much abbreviated by the use of logarithms (q.v.), and has been rendered a mere mechanical process, by the invention of Napier's bones, the sliding rule, Gunter's scale, etc.

MULTIVALVE SHELLS, or Multivalves, are those shelly coverings of mollusks which are formed of more than two distinct pieces. In systems of conchology (q.v.) the term is one of primary importance; but since the study of the living animals has led to arrangements very different from those founded on their mere shells, a very subordinate place has been assigned to it, as indicating a distinction much less important than was at first supposed. Thus citations (q.v.), which have multivalve shells, are now placed in the same order of gastropods with limpets (q.v.) of which the shells are univalve; and _pholad_ (q.v.) and _teredo_ (q.v.), which have two principal valves and some small accessory valves, the latter also a long shelly tube, are placed among lamellibranchiate mollusks, along with most of the bivalves of conchologists. In conchological systems, barnacles and acorn-shells were also generally included, and ranked among multivalves; but these are now no longer referred even to the same division of the animal kingdom. See _Cirriphoda_.

MULTNOMAH, a co. in n.w. Oregon; drained by the Willamette and Columbia rivers, the latter being its n. boundary; traversed by the Oregon Central and Oregon and California railroads; about 400 sq.m.; pop. '80, 25,201—17,269 of American birth. The surface is nearly level and is covered by forests, lumber being the chief product. Co. seat, Portland.

MULTURES, in Scotch law, mean a quantity of grain either manufactured or in kind deliverable to the proprietor or tacksman of a mill for grinding the corn sent there. Some persons living in the neighborhood are bound to send their corn to be ground at a particular mill, in which case the lands are said to be ascribed to the mill, and form the third or suken, and the tenants or proprietors of the lands are called insuken multurers, who are only bound to go to the mill. The title of malt is thus classed among servitudes, being a kind of burden on the lands. Such a right is unknown in England, except sometimes in old manors.

MUM, a peculiar kind of beer, formerly used in this country, and still used in Germany, especially in Brunswick, where it may be almost regarded as the national drink. Instead of only malt being used, it is made of malt and wheat, to which some brewers add oats and bean-meal. It is neither so wholesome nor so agreeable as the common ale or beer.

MUMMUS, Lucrus, about b.c. 185-120; a Roman of plebeian birth; first spoken of as a praetor in the province of farther Spain, where he met with some, but not very great military success. In 146 he was elected consul and placed in command of the Achaean war. The first battle was decisive. It was fought near Corinth and resulted in the complete defeat of the Greek allies. The surname of Achaicus was given to Mummius, and a triumph was decreed a second time. The cities of Corinth, Thebes, and Chaleis were plundered and then destroyed by the Roman troops. As trophies of his victory, Mummius caused many of the most valuable works of art to be sent to Rome; and it is related of him, as illustrating his dense ignorance in everything not pertaining to military matters, that he insisted that, if those who were to convey the pictures and statues should break or lose any, they should replace them by new ones. Cicero speaks of him as a honest and plain but honest man, and says that, of all his enormous plunder, none was reserved for his own use. In 141 he was again elected consul, and it was then that the capital was gilded for the first time. Nothing is known certainly about his later life and his death, some writers saying that he died in exile at Delos, and others that his death occurred in Rome, and that his daughter received a dowry from the senate.

MUMMY. See Embalming.

MUMMY-WHEAT is said to be a variety of wheat produced from grains found in an Egyptian mummy. But no good evidence of this origin has been adduced—in fact it is as good as proved to be impossible; and the same variety has long been in general cultivation in Egypt and neighboring countries. The spike is compound—a distinguishing
character, by which it is readily known, but which is not altogether permanent. It is occasionally cultivated in Britain, but seems more suitable to warmer regions.

**Mumps**, this is a popular name of a specific inflammation of the salivary glands described by nosologists as *gymnarche parotidinorum* or *parotitis*. In Scotland it is frequently termed the *brittis*.

The disorder usually begins with a feeling of stiffness about the jaws, which is followed by pains, heat, and swelling beneath the ear. The swelling begins in the parotid, but the other salivary glands (q.v.) usually soon become implicated, so that the swelling extends along the neck toward the chin, thus giving the patient a deformed and somewhat grotesque appearance. One or both sides may be affected, and, in general, the disease appears first on one side and then on the other. There is seldom much fever. The inflammation is usually at its highest point in three or four days, after which it begins to decline, suppuration of the glands scarcely ever occurring. In most cases no treatment further than antiphlogistic regimen, due attention to the bowels, and protection of the parts from cold, by the application of flannel or cotton-wool, is required, and the patient completely recovers in eight or ten days.

The disease often originates from epidemic or endemic influences, but there can be no doubt that it spreads by contagion; and, like most contagious diseases, it seldom affects the same person twice. It chiefly attacks children and young persons.

**Münchhausen**, Karl Friedrich Hieronymus, Baron von, a member of an ancient and noble German family, who attained a remarkable celebrity by false and ridiculously exaggerated tales of his exploits and adventures so that his name has become proverbial. He was b. in 1720 at the family estate of Bodenwerder, in Hanover, served as a cavalry officer in the Russian campaigns against the Turks in 1737-39, and died in 1797. A collection of his marvelous stories was first published in England under the title of Baron Münchhausen's Narrative of His Marvellous Travels and Campaigns in Russia (Lond., 1785). The compiler was one Rudolf Erich Raspe, an expatriated countryman of the baron's. A second edition appeared at Oxford (1786) under the title of The Singular Travels, Campaigns, Voyages, and Sporting Adventures of Baron Münchhausen, commonly pronounced Munchausen; as he relates them over a bottle when surrounded by his friends. Several other editions rapidly followed. In the same year (1786) appeared the first German edition, edited by the poet Bürger; the latest—entitled Des Frieders von Münchhausen serularen Res Cain und Abenteuer (1849 and 1855)—is enriched by an admirable introduction by Adolf Eißlen, on the origin and sources of the fantastic book, and on the kind of literary fiction to which it belongs. Eißlen's father knew the splendid old braggart in his latter days, and used to visit him. Nevertheless, although Raspe may have derived many of his narratives from Münchhausen himself, he appears to have drawn pretty largely from other sources. Several of the adventures ascribed to the baron are to be found in older books, particularly in Bebel's *Fröhliche* (Strasb., 1808); others in Castiglione's *Cortigiano*, and Bickermann's *Utopia*, which are included in Lange's *Deutche Academie* (Heilbronn, 1765). Münchhausen's stories still retain their popularity, especially with the young.

**Munch, Andreas**, b. Norway, 1810; studied jurisprudence at Christiania, in the library of whose university he was employed as an amanuensis from 1830 to 1860. He published *Poems, Old and New*, in 1848, and *New Poems* in 1850. His dramas, *Salomon de Curs*, 1845, and *Lord William Russell*, 1857, were well received. He was pensioned by the government in 1860.

**Munch, Peter Andreas**, 1810–63; b. Norway, educated at Skien and at the university of Christiania, where he took a degree in jurisprudence. Preferring the study of languages and history to law, he became professor of history at Christiania. In 1861 he was appointed historiographer and archivist of Norway. His favorite studies were the ancient history and languages of Scandinavia, on which he propounded some novel theories. He maintained that three distinct dialects prevailed in the kingdoms of Norway, Sweden, and Denmark, and that the so-called *Icelandic* literature was really the production of ancient Norway. He held that the modern Icelanders keep one dialect and the inhabitants of the Faeroe islands another of the ancient Norwegian. He rejected the term "Icelandic," for which he substituted "old Norwegian." He was a bitter opponent of "Scandinavian," or the union of Norway, Sweden, and Denmark in one kingdom. He published an *Old Norwegian Grammar*, an *Old Norwegian Reading Book*, and a *History of Norway, Sweden, and Denmark*, and edited a number of Icelandic works, including the elder *Edda* and the *Royal Mirror*.

**Münch-Bellinghausen**, Elias Franz Joseph von, Baron, 1806–71; b. Cracow: studied jurisprudence, and held a number of government offices in Austria. His first play, *Griestlis*, was produced at the Burg theater in Vienna, of which he was afterward director, in 1834, and was well received. It was followed by *The Adept*, 1836;
Mumps.

Muncheh-Gladdback, a t. in Rheinish Prussia, 16 m. by rail, w. by s. of Dusseldorf. It has large manufactures of linen and damask cloths. Pop. 31,970.

Mundt, Clara (Müller), 1814-73; her father, active censor of Neubrandenburg, gave her an excellent education which rapidly developed the powers of her mind and turned her attention to the study of serious subjects. She was married in 1839 to the radical writer Theodor Mundt, whose advanced opinions in regard to the emancipation of women, etc., she adopted. She began her literary career under the pseudonym of Louise Mihlbach, and published a large number of romances abounding in startling situations, in which poison and the stiletto play a principal part. She is best known by her historical novels, which have all been translated into English, and are distinguished rather for their brilliancy than for their accuracy. Among them are Joseph II. and his Court; Frederick the Great and his family; Marie Antoinette and her son; Queen Hortense; Goethe and Schiller; and Napoleon and Blücher.

Muncie, co. seat of Delaware co., Ind.; on the w. fork of the White river, at the junction of the Cleveland, Columbus, Cincinnati, and Indianapolis, and the Fort Wayne, Muncie, and Cincinnati railroads; 51 m. n.e. of Indianapolis by rail; pop. 4,513. It has a good local business. The town has 9 churches, a court house, a city hall, banks, newspapers, good schools, a public library, and two or three foundries and factories.

Mundt Theodore, 1808-61; b. Germany; educated at the universities of Berlin and Leipsic. He took an active interest in public affairs, and identified himself with that party of rising authors, journalists, and politicians, known as "Young Germany." His political views brought him into disfavor with the government, and he left Germany, and made a European tour. On his return he was permitted to become a member of the teaching body of the university of Berlin, and in 1858, he was appointed to the chair of history at Breslau. Two years later he was made director of the Berlin university library. The first of his works to attract attention, was Madonna, or Conversations with a Säint, a powerful but unwholesome book, which is said to have induced Charlotte Stiegitz to kill herself out of affection for her husband. Her works were collected and published by Mundt in 1855. After the publication of a number of books of travel, he wrote a series of historical or romantic novels, of which the most successful were: Curmola, or the Anabaptists, 1814; Mundose, or the Arch-Sonndref, 1817; and the Malwolves, 1830. He edited in conjunction with Varnhagen von Ense, the posthumous works of Knebel, and prepared an edition of the political writings of Luther. He also wrote a History of Society, History of Contemporary Literature, and a universal literary History. He married the novelist, Klara Müller.

Mundane Egg. In many heathen cosmogonies, the world (Lat. mundus) is represented as evolved from an egg. The production of a young animal from what neither resembles it in form nor in properties, seems to have been regarded as affording a good figure for the representation of a well-ordered world. In the Egyptian, Hindu, and Japanese systems, the Creator is represented as producing an egg, from which the world was produced. The same notion is found, in variously modified forms, in the religions of many of the ruder heathen nations. Sometimes a bird is represented as depositing the egg on the primordial waters. There are other modifications of this notion or belief in the classical and other mythologies, according to which the inhabitants of the world, or some of the gods, or the powers of good and evil, are represented as produced from eggs. The egg appears also in some mythological systems as the symbol of reproduction or renovation, as well as of creation. The Mundane Egg belonged to the ancient Phoenician system, and an egg is said to have been an object of worship.

Mungo, Saint, the popular name of St. Kentigern, one of the three great missionaries of the Christian faith in Scotland. St. Ninian (q.v.) converted the tribe of the s.; St. Columba (q.v.) was the apostle of the w. and the n.; St. Kentigern restored or established the religion of the Welsh or British people, who held the country between the Clyde on the n., and the furthest boundaries of Cumberland on the s. (see BRETTS AND SCORS). He is said to have been the son of a British prince, Owven ab Urien Rieged, and of a British princess, Dwynwen or Thenaw, the daughter of Llewdlyn Lueddor of Dinus Eiddyn, or Edinburgh. He was born about the year 514, it is believed at Culross, on the Firth, the site of a monastery then ruled by St. Serf, of whom St. Kentigern became the favorite disciple. It is said, indeed, that he was so generally beloved by the monastic brethren, that his baptismal name of Kentigern or Cyndeyrn, signifying "chief lord," was exchanged in common speech for Mungo, signifying "lovable" or "dear friend." Leaving Culross, he planted a monastery at a place then called Cathures, now known as Glasgow, and became the bishop of the kingdom of Cumbria (q.v.). The nation would seem to have been only partially converted, and the accession of a new king drove St. Kentigern from the realm. He found refuge among the kindred people of Wales, and there, upon the banks of another Clyde, he founded another monastery and bishopric, which still bears the name of his disciple, St. Asaph. Recalled to Glasgow by a new
king, Ryderech or Roderic the bountiful, Keutigern renewed his missionary labors, in which he was cheered by a visit from St. Columba, and dying about the year 601, was buried where the cathedral of Glasgow now stands. His life has been often written. A fragment of a memoir, composed at the desire of Herbert, bishop of Glasgow, between 1147 and 1164, has been printed by Mr. Cosmo Innes in the *Registrum Episcopatus Glas- gurnensis*. The longer life by Joceline of Furness, written about 1180, was published by Pinkerton in his *Vita Antiquae Sanctiorum Scotica*. It appeals to two still older lives. The fame of St. Keutigern is attested by the many churches which still bear his name, as well in Scotland as in the n. of England. The church of Crosthwaite, where Southey is buried, is dedicated to him. The miracles which he was believed to have wrought were so deeply rooted in the popular mind, that some of them sprung up again in the 18th c. to grace the legends of the Cameronian martyrs. Others are still commemorated by the armorial ensigns of the city of Glasgow—a hazel-tree from Traquairhouse, the Kirchen in the Several large additions to the church, a tame robin which he restored to life, a hand-bell which he brought from Rome, a salmon which rescued from the depths of the Clyde the lost ring of the frail queen of Cadyow. Nor is it St. Mungo only whose memory survives at Glasgow; the parish church of "St. Enoch" commemorates his mother, St. Thenaw; and it is not many years since a neighboring spring, which still bears her name, ceased to be an object of occasional pilgrimage.

**MUNI**, a Sanskrit title, denoting a holy sage, and applied to a great number of distinguished personages, supposed to have acquired, by dint of austenities, more or less divine faculties.

**MUNICH** (Ger. *München*), the capital of Bavaria, is situated in 48° 8' n. lat., and 11° 35' e. long., in the midst of a barren and flat elevated plain, at a height of about 1700 ft. above the level of the sea. Pop. *71, 169,478*, about 90 per cent. being Roman Catholics, 9 per cent. Lutherans and Jews; *75, 185,064*. Munich lies in the midst of the Isar, and consists, in addition to the old town, of five suburbs, and of the three contiguous districts of Au, Haidhausen, and Obergiesing. By the efforts of king Ludwig I., who spent nearly 7,000,000 thalers on the improvements of the city, Munich has been decorated with buildings of almost every style of architecture, and enriched with a larger and more valuable collection of art-treasures than any other city of Germany. It possesses 42 churches, of which all but two or three are Catholic; and of these, the most worthy of note are: the cathedral, which is the see for the archbishopric of Munich-Freising, built between 1468-94, and remarkable for its two square towers, with their octagonal upper stories, capped by cupolas, and its 30 lofty and highly-decorated windows; the church of the Jesuits, or St. Michael's, which contains a monument by Thorwaldsen to Eugene Beauharnais; the Theatiner Kirche, completed in 1767, and containing the burying-vaults of the royal family; the beautiful modern church of St. Mariabihl, with its gorgeous painted glass and exquisite wood-carvings; the round church, or Basilica of St. Boniface, with its dome resting on 64 monoliths of grey Tyrolean marble, and resplendent with gold, frescoes, and noble works of art; the cruciform-shaped Ludwig Kirche, embellished with Cornelius's fresco of the Last Judgment; and lastly, the Court Chapel of All Saints, a perfect casket of art-treasures. Among the other numerous public buildings, a description of which would fill a volume, we can only briefly refer to a few of the more notable; as the theater, the largest in Germany, and capable of accommodating 2,400 spectators; the post-office; the Ruhmes-halle; the new palace, including the older royal residence, the treasury and chapel, antiquarian collections, etc.; and the Königsbau, designed by Klenze in imitation of the Pitti palace, and built at a cost of 1,250,000 thalers, containing J. Schorner's frescoes of the Nibelungen; the banqueting halls, rich in sculpture by Schwanthaler, and in grand fresco and other paintings. In the still incomplete suburb of Maximilian are situated the old Pinakothek, or picture-gallery, erected in 1839 by Klenze, containing 300,000 engravings, 9,000 drawings, a collection of Etruscan remains, etc.; and immediately opposite to it, the new Pinakothek, completed in 1853, and devoted to the works of recent artists; the Glyptothek, with its 12 galleries of ancient sculpture, and its noble collection of the works of the great modern sculptors, as Canova, Thorwaldsen, Schadow, etc. Among the gates of Munich, the most beautiful are the Siegestor ("The Gate of Victory"), designed after Constantine's triumphal arch in the Forum, and the Isarthor with its elaborate frescoes. In addition to these and many other buildings intended either solely for the adornment of the city, or to serve as depositories for works of art, Munich possesses numerous scientific, literary, and benevolent institutions, alike remarkable for the architectural and artistic beauty of their external appearance, and the liberal spirit which characterizes their internal organization. The library, which is enriched by the biblical treasures of numerous suppressed monasteries, contains about 800,000 volumes, of which 1300 are incunabula, with nearly 22,000 MSS. The university, with which St. Landan was amalgamated in 1526, and now known as the Ludwig-Maximilian university, comprises 5 faculties, with a staff of 116 professors and teachers. In 1876 the number of matriculated students attending the university was 1263. In association with it are numerous medical and other schools, a library containing 200,000 volumes, and various museums and cabinets.

Munich has an ably-conducted observatory, supplied with first-rate instruments by
Fraunhofer and Reichenbach; 3 gymnasias, 4 Latin, 1 normal, various military, professional, polytechnic, and parish schools, of which the majority are Catholic; institutions for the blind, deaf and dumb, and crippled, and for female orphans, besides numerous hospitals, asylums, infant schools, etc.; an academy of sciences; royal academies of painting, sculpture, music, etc.; a botanical garden, parks, public walks, and gardens adorned with historic, patriotic, and other monuments, and designed for the celebration of annual and other national fairs and festivals; spacious cemeteries, etc. Munich is mainly indebted to Ludwig I. for its celebrity as a seat of the fine arts, as the greater number of the buildings for which it is now famed were erected between 1829 and 1850, although, under his successors, Maximilian II., and Ludwig II. (ascended the throne in 1864), the progress of the embellishments of the city has been continued on an equally liberal scale.

Munich is somewhat behind many lesser towns of Germany in regard to literary advancement and freedom of speculation, while its industrial activity is also inferior to its state of high artistic development. It has, however, some eminently good iron, bronze, and bell foundries, and is famed for its lithographers and engravers, and its optical, mathematical, and mechanical instrument-makers, amongst whom Utschneider, Fraunhofer, and Erth have acquired a world-wide renown. Munich is noted for its enormous breweries of Bavarian beer; and has some good manufactories for cotton, wool, and damask goods, wax-cloth, leather, paper-hangings, carriages, pianos, gold, silver, and steel wares, etc.

The present name of this city cannot be traced farther than the 12th c., when Henry the lion raised the Ville Martchen from its previous obscurity by establishing a mint within its precincts, and making it the chief emporium for the gold which was obtained from Halle and the neighboring districts. In the 13th c. the dukes of the Wittelsbach dynasty selected Munich for their residence, built the Ludwigsburg, some parts of whose original structure still exist, and surrounded the town with walls and other fortified defenses. In 1327 the old town was nearly destroyed by fire, and rebuilt by the emperor Ludwig of Bavaria, very much on the plan which it still exhibits; but it was not till the close of last century, when the fortifications were razed to the ground, that the limits of the town were enlarged to any extent. The last fifty years, indeed, comprise the true history of Munich, since within that period all its finest buildings have been erected, its character as a focus of artistic activity has been developed, its population has been more than doubled, and its material prosperity augmented in a proportionate degree.

MUNICIPAL ARCHITECTURE, the style of the buildings used for municipal purposes, such as town-halls, guild-halls, etc. These were first used when the towns of the middle ages rose in importance, and asserted their freedom. Those of north Italy and Belgium were the first to move, and consequently we find in these countries the earliest and most important specimens of municipal architecture during the middle ages. It is only in the "free cities" of that epoch that town-halls are found. We therefore look for them in vain in France or England till the development of industry and knowledge had made the citizens of the large towns so wealthy and important as to enable them to raise the municipal power into an institution. When this became the case, in the 15th and 16th centuries, we find in these countries abundant instances of buildings erected for the use of the guilds and corporations and the municipal courts. Many of these still exist along with the corporate bodies they belong to, especially in London, where the halls are frequently of great magnificence. Many of these corporation halls have recently been rebuilt by the wealthy bodies they belong to, such as the fishmongers, merchant tailors, goldsmiths, and other companies. Municipal buildings on a large scale for the use of the town councils and magistrates have also been recently erected in many of our large towns, which had quite out-grown their original modest buildings; and now no town of importance is complete without a great town-hall for the use of the inhabitants.

Municipal buildings always partake of the character of the architecture of the period when they are erected; thus we find in Italy that they are in the Italian-Gothic style in Como, Padua, Vicenza, Venice, Florence, etc., during the 13th, 14th, and 15th centuries. In Belgium, during the same period, they are of the northern Gothic style, and are almost the only really fine specimens of the civil architecture of the middle ages we possess. The cloth-hall at Ypres, and the town-halls of Brussels, Louvain, Bruges, Oudenaarde, etc., the exchange at Antwerp, and many other markets, lodges, halls, etc., testify to the early importance of the municipal institutions in Belgium.

It is a curious fact that in France, where the towns became of considerable importance during the middle ages, so few municipal buildings remain. This arises from the circumstance that the resources of the early municipalities of France were devoted to aid the bishops in the erection of the great French cathedrals, and the townspeople used these cathedrals as their halls of assembly, and even for such purposes as masques and amusement.

Of the English corporation halls, those which remain are nearly all subsequent to the 14th c., from which time to the present there are very many examples. The guild-hall of London is one of the earliest. The present building was begun in 1411, and was built chiefly by contributions from the trades "companies" of London. Of the town halls recently erected, those of Manchester, Liverpool, and Leeds are amongst the most important.
Municipality. 296

Municipality, Municipal Corporation (from Lat. municeps, from munus and capio, one who enjoys the rights of a free citizen), a town or city possessed of certain privileges of local self-government; the governing body in such a town. Municipal institutions originated in the times of the Roman empire. The provincial towns of Italy, which were from the first Roman colonies, as also those which, after having an independent existence, became members of the Roman state, though subjected to the rule of an imperial governor, were allowed to enjoy the right of regulating their internal affairs. A class of the inhabitants called the curia, or decuriones, elected two officers called duumviri, whose functions were supposed to be analogous to those of the consuls of the imperial city, and who exercised a limited jurisdiction, civil and criminal. There was an important functionary in every municipality called the defender civilis, or advocate for the city, the protector of the citizens against arbitrary acts on the part of the imperial governor. In the later ages of the empire, the decuriones were subject to heavy burdens: not compensated by the honor of the position, which led many to endeavor to shun the office. The municipal system declined with the decline of the empire, yet it retained vitality enough to be afterwards resuscitated in union with feudalism, and with the Saxon institutions of Britain. Some cities of Italy, France, and Germany have indeed derived their present magnificence by direct succession from the days of imperial Rome, as is notably the case with Cologne. The bishop, being a shield between the conquerors and the conquered, in many cases discharged the duties or obtained the functions of the defender civilis. To the north of the Alps, under the feudal system, he became officially the civil governor of the city, as the count was of the rural district. In southern Europe, where feudalism was less vigorous, the municipalities retained a large share of freedom and self-government.

Of the cities of the middle ages, some were entirely free; they had, like the provincial towns of Italy before the extension of the Roman conquests, a constitution independent of any other powers; Venice, Genoa, Florence, Hamburg, and Lübeck all stood in this position. Next in dignity were the free imperial cities in Germany, which, not being comprehended in the dominions of any of the princes, were in immediate dependence on the empire. Most of these cities rose into importance at the rise of the Empire of the Franks, and were often founded by the Francian conquerors, to afford some counterpoise to the growing power of the immediate nobility. Nuremberg was especially celebrated for its stout resistance to the house of Brandenburg, and the successful war which it waged with the Francian nobility. In England the more important cities were immediate vassals of the crown; the smaller municipalities sometimes owned a subject superior, sometimes a greater municipality for their overlord.

Under the Anglo-Saxons, the English burgesses were subject to the rule of an elective officer called the "portreef," who exercised in the burgh functions similar to those of the shire-reve in the shire. The Norman conquerors recognized the already existing privileges of the towns by granting them charters. Instead of a shire-reve, a viscount was placed by the king over each shire, and a bailiff instead of the former elective officer over each burgh. In the larger towns, the bailiff was allowed to assume the Norman appellation of mayor. The municipal franchise seems to have been vested in all the residents of the burgh, who shared in the payment of the local taxes, and performance of local duties. Titles to freedom were also recognized on the grounds of birth, apprenticeship, marriage, and sometimes free gift.

In all the larger towns, the trading population came to be divided into guilds or trading companies, through membership of which companies admission was obtained to the franchise. Eventually the whole community was enrolled in one or other of the guilds, each of which had its property, its by-laws, and its common hall, and the community elected the chief officers. It was on the wealthier and more influential inhabitants that municipal offices were generally conferred; and the practice gradually gained ground of these functionaries perpetuating their authority without appealing to the popular suffrage. Contentions and disputes arose regarding the right of election, and eventually the crown threw the weight of its influence into the scale of self-elected ruling bodies. As the greater municipalities grew in strength, we find their right recognized to appear in parliament and to send representatives. The sovereigns of the house of Tudor and Stuart acquired the habit of extending the right of parliamentary representation to burghs not in the enjoyment of it, while at the same time, by granting or renewing to them municipal charters, they modeled the constitution of these burghs to a self-elective type, and restricted the right of voting in the choice of a representative to the governing body. During the reign of William III., Anne, and the earlier Georges, the influence of the crown was largely employed in calling new municipal corporations into existence, with the view of creating additional parliamentary support for the ministry in power. The burghs of Scotland had a history much like that of the burghs of England; their earlier charters were mere recognitions of already existing rights, and were granted to the inhabitants at large. In the course of the 14th and 15th centuries, the municipal suffrage fell gradually more and more into the hands of restricted bodies of men, until Act 1439, c. 5, gave to the council the right of appointing their successors, the old and new council together electing the office-bearers of the corporation. This state of things con-
Municipality.

continued till 1833, not without much complaint. In the Scottish burghs, the several trades possessed a much more exclusive monopoly than in England. Along with the outcry for parliamentary reform arose an outcry for municipal reform; and a separate municipal reform act putting an end to the close system was passed for each part of the empire. The English act (5 & 6 William IV, c. 76), entitled "An act to provide for the regulation of municipal corporations in England," conferred the franchise on the owners and occupiers of property within the burgh, with certain qualifications as to property, residence, etc. This constituency elected the councillors, and from them the burgesses and aldermen were chosen. Act 32 and 33 Vict. c. 55, limited the requisite period of residence to one year's occupation, and the ballot was introduced by 33 and 34 Vict. c. 53, in municipal as in parliamentary elections. Act 3 and 4 William IV, made an entire change in the mode of electing councils in Scottish burghs which already had a council, and conferred councils on burghs which had none. A vote was given to every one who had resided six months in the burgh, or within seven of miles of it, and possessed the requisite qualification to exercise the parliamentary franchise: a property qualification similar to what conferred the parliamentary franchise being required in burghs that did not send or contribute to send a member to parliament. The municipal elections amendment act (Scotland) 1865, has placed the municipal franchise in the hands of all registered voters to return a number of members of parliament, and in the case of burghs not represented in parliament, in the hands of all persons possessing similar property qualifications: and act 33 and 34 Vict. c. 92 has provided for the establishment of a municipal register in burghs not represented in parliament. An exemption, under 3 and 4 William IV, c. 76, of nine small burghs from the operation of the new system has been done away with. Town-councillors must be electors residing in or carrying on business in the burgh. They remain in office three years, and elect from their number the provost and bailies. The English act of William IV, abolished the exclusive privileges of the guilds, but these monopolies continued in Scotland till 1859, when they were swept away by 9 and 10 Vict. c. 17. The Irish municipal system, which had been imported ready-made from England, was assimilated to the altered English system by 3 and 4 Vict. c. 108.

MUNICIPALITY—MUNICIPAL CORPORATION (ante), for the management of the affairs of a town or city. Municipal corporations, in the United States, are public corporations established by law for political purposes, and chiefly to exercise local and subordinate powers of legislation for the town or district incorporated. The corporation is not the body of the people, nor is it the officers collectively considered, but rather that legal entity created by the act of incorporation and limited thereby. Distinction must not be made between a municipal corporation proper and what are known as quasi corporations not created by the motion of the people of the district, but rather as political or territorial divisions of the state, such as counties, and the peculiar New England townships, which are examples of almost pure democracy. The laws regulating the incorporation of English towns and cities have little application to municipal corporations in this country. Here none are founded on common law or royal charter, and but few are based upon prescription. It may be said that they exist only by legislative enactment, and possess no powers not created by the statute. The majority of municipal corporations are created by charter singly, but general laws of incorporation have been passed in many states, as Ohio, Iowa, Pennsylvania, Indiana, Missouri, Tennessee, and North Carolina. When the incorporation is single or special, the charter sets out that the inhabitants are constituted a body politic with such a name and style; that by that name they may have perpetual succession, and may use a common seal, sue and be sued, etc. The territorial boundaries are defined and provision made as to the form of government—usually by a council made up of aldermen and councilmen, or by trustees—as to division into wards, qualifications of voters, powers of city council to collect debts and lay taxes, etc. General laws of municipal incorporation as in the states above mentioned, usually start by abolishing all special charters existing, and establish general regulations for the incorporation, government, and legislation of municipal corporations throughout the state. Frequently such laws classify the towns to be incorporated as regards their circumference into cities of first or second grade, towns, and villages. To become operative the charter granted by the legislature must be accepted by the body of citizens to be incorporated. Provisions sometimes exist in the constitutions of the states limiting the power of the legislature in granting powers and privileges to towns and cities.

When established, the municipal corporation is not beyond the power of the legislature; thus it has been held that the latter may repeal charter provisions, allowing the licensing of liquor dealers, and even such as relate to police regulations. In other words, the town has no vested right in its charter privileges, and they may always be altered or revoked with the important exception that the rights of existing and constitutional creditors must not be disregarded. In the celebrated Dartmouth college case it was strongly intimated from the bench that the legislature could not revoke a grant to municipal corporations. The legislature has general control over public property, and may authorize a railroad to occupy the streets of a city, without payment therefore. "No exact form of words is necessary to give force to the charter, and the cor-
Corporations may even be created by implication. The charter may be amended or repealed by either general or special law. The powers given to the municipality are those expressly stated in the charter, such as may fairly be implied therefrom, and such as are essential to the carrying out of the purpose for which the body is created. Where the city is given a discretion upon any point it is not for the courts to say whether such discretion has or has not been wisely used. Thus, if it have power to open new streets or grade old ones when necessary for the welfare of the city, the question of necessity is one for the determination of its own governing body. It has been fully decided that taxes and public funds cannot be seized under execution or by writ of garnishment.

Among the leading powers of a municipal corporation are the rights of taxation, of eminent domain appointing officers, enacting ordinances, and instituting actions. Many special powers are given as to borrowing money, police regulations, wharves, ferries, giving aid to railroads, entertaining guests, etc. That in all these and other powers the corporation may act freely when there is special enactment in the charter or general law is not a matter of doubt. But how far may they extend their operations without such authority and under a general clause empowering them to act for the general welfare of the city? The power to become indebted is often specially limited. The doctrine that cities may aid railroads by the purchase of bonds or otherwise was established by the U.S. Supreme Court in New York vs. Supervisors (1873), on the ground that railroads are public juris. The power to borrow money is implied when necessary to the ends for which the corporation exists. It seems to be the doctrine that the corporate franchise can cease only by act of legislature, that is, that the municipality cannot voluntarily surrender its privileges. Abduction is the removal of an agent or officer of a corporation before his term is expired, and must be for cause, which, however, may be for other than official dereliction, as for infamous private character. The city government may regulate local elections so as to preserve purity of the ballot without special authority; special tribunals to decide contests are often established by the charter, and courts of law may inquire into the proceedings by writs of quo warranto or mandamus, unless the legislature has denied such right. As to legal liability, an officer improperly removed may bring suit for damages against the corporations; but the city or town cannot have an action against an officer or agent for damage resulting from an honest mistake on his part.

Corporate meetings are usually provided for by charter, but may be regulated by ordinance. In the peculiar New England township system the meeting is actually an assembly of the whole body of inhabitants through executive orders, which are necessarily mere formalities; and in many places true municipal corporations have control over the same territory. Elsewhere the representative system prevails. Notice of time and place of meeting should be given, and it is customary to state the nature of matters to be discussed. Ordinances may be declared void by the legislature if oppressive or in restraint (not regulation) of trade. Of course, if power to enact law is given, power to punish is implied, usually by fine; and it has been held that there is no power of imprisonment except by statutory provision; yet the power of appeal from a municipal to a higher court has been held to constitute the right of the citizen to a trial before a jury. Strangers are bound by local ordinances.

The powers of the municipality under a "general welfare" clause are to be interpreted very liberally when the health, peace, or safety of a city are at stake. Contracts may be entered into under the express or implied authority of the statute. Parties contracting with the city or town are generally held to be agents of the corporation, and the scope of an agent's authority; a unauthorized contract may be accepted by ratification. Payment is usually by warrant on the treasurer, and if, after being cached by the latter, the warrant is again put on the market, even though by a regular officer of the city, it is worthless, though in the hands of an innocent third party. Municipal corporations have large powers as to acquiring and disposing of property; conveyance must be under corporate name and seal, a vote in council not passing title. As to the right of eminent domain, most important questions have arisen, and the lines of power are not yet clearly drawn. The constitution of the United States provides that private property shall not be taken for public use except upon just compensation, but manifestly the raising of taxes and the destruction of property under necessary police powers do not come under this head. The rule is that the purpose for which property is taken must be useful, as in water-works, sewers, etc., and not merely ornamental. Public parks have been held necessary to the health and well-being of a city, and the right of eminent domain has been allowed. Proper notice must be given. Unjust assessment of damages may be brought before a court by writ of certiorari. The damages are usually assessed by commissioners; in New York by "a jury, or not less than three commissioners appointed by a court of record." It has been held that the power of legislatures to place railroads in public streets may be delegated to municipal authorities. In assessment for street improvements it is very common to equalize the benefits and damages done to property holders, paying compensation to some and assessing others. The privileges both as to eminent domain and taxation which have been granted by legislature to large cities have been dangerously great, and nowhere more so than in the city of New York. In such cities the interests involved are so immense and the danger of corruption so great, that there is a growing desire to restrain the power.
of the legislature by constitutional provisions. Officers and agents of the municipal corporation may be proceeded against under writs of mandamus if they neglect their duties, or quo warranto if they exceed or usurp powers. As to torts, the corporation is not liable when it uses its discretionary powers in good faith, or if it fail to secure perfect execution of its by-laws, or for damage by riotous mobs. But where there has been absolute malfeasance or neglect to perform duties, a suit lies, even though liability is not specified in the charter. Municipal corporations are not insurers against accident, but are liable for neglect, as in defective and unsafe streets, yet it has been held that in New England towns there exists no such liability, unless there be special enactment. Where a private individual was injured by the negligence of a contractor employed by the corporation, the latter was held liable. But it is supposed that either notice of the defect or danger must be given to the city, or else the circumstances must be such as to imply knowledge of the facts by the party concerned.

MUNIMENT-HOUSE, a strong fire-proof apartment or building suited to contain archives, papers, and other valuables.

MUNJEET (Rutia cordifolia or munjistro), a species of madder (q.v.), of which the root yields an excellent red dye. The plant differs from the common madder in its more distinctly quadrangular stem, its cordate-oblong leaves commonly in fours, and its red berries. It is a native of India, China, Japan, Central Asia, and Siberia. The root has long been used in India as affording a red dye; and is now an article of export to Europe, as a substitute for madder.

MUNK, SALOMON, b. 1805, in Glozau, in Silesia, of Jewish parents; studied at Bonn and Heidelberg, and at Paris under Sacy and Chizy; went to Oxford in 1835, in search of the Arabic original of maimonides; and in 1840 was made custodian of the oriental manuscripts in the Bibliothèque de Paris. He accompanied Montefiore and Crémiieux to Egypt, bringing back many valuable manuscripts. He gave up his position in the library in 1850 on account of weakness in the eyes. He wrote Arabic and Hebrew critical books from 1835 to 1892, publishing his Philosophy and Philosophical Works of the Jews, in German, in 1852.

MUNKACS, a market t. of Hungary, situated on an affluent of the Theiss, 178 m. n.e. of Pesth. The inhabitants are mostly artizans, and the chief production is hosiery. There are also alum manufactures, sulphur-works, and in the vicinity, iron-works and mines of rock-crystal, called Hungarian diamonds. A short distance e. from the town is the fortress (founded in 1559) of Monkaes, built upon an isolated height, which, although small and insignificant-looking, yet, from its strong walls and advantageous position, has for the last few centuries, withstood many a siege. Since the beginning of the present century, it has been used as a state-prison. Pop. '69, 8,602.

MUNKACSY, MiHALY, b. at Munkacs, Hungary, studied art with Knaus, and was a medalist of the Paris salon of 1870 and 1874. Among his works are the "Story of the Hunt;" the "Mont de Piéct;" the "Night Prowlers;" and that by which he is known in the United States, "Milton dictating to his daughters;" which is in the Lenox library, New York.

MUNRO, ALEXANDER, 1827-71, b. England; a sculptor, whose statues of "Hippocrates," "Davy," and "Galileo," are in the Oxford museum. His principal works were the statue of James Watt, at Birmingham, and of queen Mary in Westminster hall. His portraits in bass-relief were fine. All his productions show masterly grace and elegance. He died in France.

MUNROE, Sir Thomas, 1760-1827, b. in Glasgow; emigrated to India when about 20 years old, and became an officer of the army employed by the East India company. By valuable service in many campaigns, he rose to the rank of major-gen., and in 1819 was appointed governor of the city of Madras, and soon after knighted.

MUNSEES, MINNIS, or MONSEYS, a tribe of North American Indians, who resided on the upper Delaware and Minisink rivers. In 1663 they joined the Esopus tribe in an attack upon a Dutch fort for which act they were punished by gen. Krieger. They laid claim to the territory extending from the Minisink to the Hudson, the head waters of the Delaware and the Susquehanna, and s. to the Lehigh and Conewago. Early in the 18th c., settlers began to encroach upon their lands and drove them back to the Susquehanna. In spite of the efforts of the Moravians to win them, they moved w. through the Iroquois and joined the French at Niagara. Sir William Johnson, with some difficulty, managed to gain them over to the side of the English. After the fall of the French, some of them joined the Moravians, but during the revolutionary war, most of the tribe under capt. Pipes withdrew to Sandusky and fought for the British. Even after the war they remained hostile, and were not reduced to terms until 1805. In 1808 a portion of the tribe settled on Miami land at White river. Later they joined the Stockbridge Indians near Green bay. In 1839 they were removed to Kansas. The tribe is now nearly extinct. Their language was a dialect of the Algonquin and similar to that of the Delawares.

MUNSELL, JOEL, b. Mass., 1808; removed to Albany, N. Y. in 1827, and distinguished himself as a printer, journalist, and author. In 1829 he was the editor of the Albany Miner, and New York State Mechanic. He published Annuals of Albany, 10 vols:
Collections on the History of Albany, 4 vols.; Every-Day Book of History and Chronology; Chronology of Paper and Paper-making. His collection of works on printing is the largest ever made in America, and part of it has been purchased for the New York state library.

MUNSON. Æneas. 1734-1836, b. Conn.; educated at Yale, and studied theology. He was chaplain in a colonial regiment during the French war; after which he studied medicine, and began to practice in 1736. He settled at New Haven in 1760, and attained a high rank in his profession there. He was president of the state medical society, and a professor in the Yale medical school from its foundation.

MUNSTER, the largest of the four provinces of Ireland, occupies the s.w., and is bounded on the n. by Connaught, on the e. by Leinster, and on the w. and s. by the Atlantic. It contains the six counties of Chere. Cork, Kerry, Limerick, Tipperary, and Waterford, and the country is described under these heads. Area, 6,064,579 statute acres. The population of the province, which in 1814 was higher than that of any of the other provinces, was shown to be, in 1871, 1,393,485, or 429,743 less than that of Ulster, now the most populous of the provinces.

MUNSTER, chief t. of the district of the same name, as well as capital of all Westphalia, is situated in 51° 55' n. lat., and 7° 40' e. long., at the confluence of the An with the Münster canal, 65 m. n.e. of Düsseldorf. The pop. in 1871 was 24,815; in 1875, 55,535. Münster, which is a bishopric, and the seat of a military council, a high court of appeal, and other governmental tribunals, is one of the handsomest towns of Westphalia, retaining numerous remains of medieval architecture, whose quaint picturesqueness is enhanced by the numerous trees and shady alleys, by which the squares and streets are ornamented. Among its 14 churches, of which the majority are Catholic, the most noteworthy are the cathedral, built between the 13th and 15th centuries, and despoiled of all its internal decorations by the Anabaptists; Our Lady's church, with its noble tower; the splendid Gothic church of St. Lambert, in the market-place, finished in the 13th c., on the tower of which may still be seen the three iron cages in which the bodies of the Anabaptists, John of Leyden, Kuyperdolling, and Kretzsch, were imprisoned after they had suffered the most horrible martyrdom; and the church dedicated to St. Ludgerus, the first bishop of Münster, with its singular round tower, surmounted by an octagonal lantern. The Gothic town-hall possesses historical interest in being the spot at which, in 1648, the peace of Westphalia was signed in a large hall, which has lately been restored, and which contains portraits of all the ambassadors who were parties to the treaty. The palace, built in 1767, is surrounded by fine pleasure-grounds, including horticultural and botanical gardens, connected with the academy; and these, with the ramparts, which, since the Seven Years' war, have been converted into public walks, form a great attraction to the city. Münster is well provided with institutions of charity and benevolence. The old Catholic university of Münster was disembodied in 1818, and its funds apportioned to other educational establishments; and the present academy, which comprises a Catholic theological and a philosophical faculty, is now the principal school. It has a library of 50,000 volumes, a natural history museum, and various collections of art and antiquity connected with it. Münster has one gymnasium, and a school for female teachers and a number of town schools. The industrial products of Münster include leather, woolen fabrics, thread, starch, and sugar, besides which there are good carriage manufactories, breweries, and distilleries. The trade is limited to the produce of the country, the principal of which are the noted Westphalian ham and sausages.

Münster was known under the name of Minigardevorde in the time of Charlemagne, who, in 791, appointed it as the see of the new bishop of the Saxons, at St. Ludgerus. Towards the middle of the 11th c., a monastery was founded on the spot, which in course of time derived its present name from its vicinity to the minster, or monastery. In the 12th c., the bishopric was elevated into a principality of the empire. In the 13th c., the city was incorporated in the Hanseatic league; and in 1562 it declared its adhesion to the reformed faith, notwithstanding the violent opposition of the chapter. During the years 1557 and 1558, Münster was the scene of the violent politico-religious movement of the Anabaptists, who, with the excesses of these pretended reformers worked a violent revolution in the minds of the people, which had the effect of restoring the prestige of the episcopal power; and although the citizens occasionally made good their attempted acts of opposition to their spiritual rulers, they were finally reduced to submission under bishop Christopher Bernhard of St. Gall, who, having, in 1682, built a strong citadel within the city, transferred the episcopal place of residence thither from Koesfeld, where it had been established by earlier bishops. In the Seven Years' war, Münster was repeatedly besieged and taken by both the belligerent parties. The bishopric of Münster, which since 1719 had been merged in the archbishopric of Cologne, although it retained a special form of government, was secularized in 1803, and divided among various royal houses; but subsequently shared in the common fate of other German provinces, and was for a time incorporated with France. The congress of Vienna gave the greater part of the principality to Prussia, a small portion being apportioned to the house of Olden- burg, while Hanover acquired possession of the Münster territories of the mediatised dukedoms of Arenberg.
MUNTER, FRIEDRICH, 1761-1830, b. Germany; educated at Copenhagen and Göt-tingen, where he studied theology and archaeology. He afterwards continued his archeological researches in Italy, under the patronage of the Danish government. In 1790 he became professor of theology in the university of Copenhagen, and in 1808 bishop of Zealand. He edited the Coptic translation of Daniel, and the statutes of the Templars, and wrote works on the history of Christianity in Denmark, on the inscriptions at Persepolis, and on the religion of the Carthaginians.

MUNZER, THOMAS, one of the leaders of the Anabaptists (q.v.), was b. at Stolberg, in the Harz, took his degree at Wittenberg as master of arts, and for some time preached the doctrines of the reformation in Zwickau and other places. Ere long, however, he adopted mystic views, and declaimed against what he called the "servile, literal, and half" measures of the reformers, requiring a radical reformation both in church and state according to his "inward light." He proclaimed an entire community of goods, and incited the populace to plunder the houses of the wealthy. Mühlhausen fell for a time under his sway and that of another fanatic named Pfeifer, who joined him. He took an active part in the peasant war, and inflamed the spirits of the insurgents by the wild songs and speeches about liberty and property; but they were utterly defeated on May 15, 1525, after a severe conflict at Frankenhäusen, by the elector John and duke George of Saxony, the landgrave of Hesse, and the duke of Brunswick. Müntzer fled, but was taken and carried to Mühlhausen, where he was beheaded along with Pfeiffer and a number of others. He showed no dignity or courage in the closing scenes of his life. See Strobel's Leben, Schriften, and Lehren Thom. Müntzer's (Nürnberg, 1755); Schelmann's Thom. Müntzer (Dresd. and Leips. 1842); and Heinrich Leo in the Evangelische Kirchenzeitung (Berl. 1856).

MUNZINGER, WERNER, b. Switzerland, 1832; educated at Berne, Munich, and Paris. In 1852 he entered into business in Egypt, but soon after went on an exploring expedition southward in Africa, and was absent for about 6 years. He was attached to the expedition of Henglin in 1861, but quitted it when it reached n. Abyssinia, and in company with Kinkelbach explored an unknown territory, and determined the course of the river Gash. In 1862 he was placed at the head of the German exploring expedition, succeeding Henglin, and he endeavored to penetrate to Waday, but was unable to go farther than Kordofan. In 1864 he was appointed British consul at Massowah, and in the Anglo-Abyssinian war he acted as a guide to the English forces, after whose withdrawal he remained at Massowah as consul in the French service. In 1869, while on another exploring expedition to n. Abyssinia, he was attacked by an assassin and dangerously wounded. In 1870 he made a journey to s.e. Arabia, and was appointed governor of Massowah; and the next year he went on a new expedition into the country n. of the Bogos. Besides many contributions to geographical periodicals and the proceedings of geographical societies, he has published: Customs and Laws of the Bajos, 1869; East African Studies, 1864; The German Expedition into East Africa, 1865; and a Dictionary of the Tigre Language.

MUOTTA VALLEY, a lofty and secluded valley in the canton of Schwytz, Switzerland, through which the Muotta river flows down to lake Lucerne. Its chief place is the village of Muotta, 4 m. e.s.e. of Schwytz. Pop. 1,759.

MURAD V. (MEHMET MURAD EFFENDI), Sultan of Turkey, b. Turkey, 1840; son of Abdul-Medjid, late sultan of Turkey. On May 29, 1876, the sultan Abdul-Aziz was deposed from his throne; and on the same day Murad was visited by a high dignitary of the state and informed that he was to become sultan, whereupon he proceeded to the great hall of the Seraskeriat and was duly installed. Soon after his accession he discovered his total incapacity to conduct the government in the face of the difficulties by which it was surrounded. He became subject to fits of melancholia and lethargy, from
which it was nearly impossible to rouse him. An eminent physician was sent for to Vienna, who, after an examination, pronounced his patient unfit for the nature of his malady for the conduct of the difficult and delicate duties of his position. Upon the advice of the physician in question, the ministerial council, after referring the law questions of the case to the sheikh ul-Islam, decided upon his deposition, which was accordingly effected on Aug. 31, 1806. He was succeeded by a younger brother, Abdul-Hamid, who continues at this date (1881) to occupy the Turkish throne.

MURENA, a genus of malacopterous fishes, of those to which the name eel is commonly given, the whole of the cells being sometimes included in the family muraenidae. See Eel. The true murena have no fins except the dorsal and anal, which are low and fleshy. They have one row of sharp teeth in each jaw. The head is very large, and the jaws are moved with great power. The murena of the Romans, or Murray (*M. helena*), abounds in the Mediterranean, and is sometimes of large size, four feet or more in length, golden yellow in front and purple towards the tail, beautifully banded and marked. The size of the mouth is equal to its length. The skin of the head and face of the large cells. Its flesh is white and highly esteemed. It prefers salt water, but can accommodate itself to a fresh-water pond. The ancient Romans kept and fed it in vivaria. The story of Vedius Pollio feeding his murenas with offending slaves is well known. This murena has been caught on the British shores, but very rarely. Allied to the genus murena is the genus *siderea*, found in the Pacific.

MURAL CIRCLE, an astronomical instrument for taking declinations; consisting of a large circle built against the wall (whence its name), movable on its axis in the plane of the meridian, and with a telescope attached, also in the plane of the meridian, which turns about an axis. The circle is graduated, the whole instrument counterweighted and furnished with an illuminating apparatus for night readings. Readings are made accurate to a minute of arc. The micrometer, and the micrometer circle of the telescope, with the axis of the telescope are made parallel to the meridian by leveling and sweeping screws, and the cross lines of the eye-piece should follow a star near the equator their whole length. The instrument being rectified, the height of a star above the horizon is measured by a cup of mercury; the star is observed directly and then by reflexion, the half sum of the readings being the correct angle. The co-latitude of the place is obtained as with the theodolite. As the tube is movable about the circle, reading should always be checked by reiteration; with more than one limb of the circle.

MURAL CROWN, in heraldry, a crown in the form of the top of a circular tower, masoned and embattled. It is meant to represent the crown which was given by the Romans as a mark of distinction to the soldier who first mounted the walls of a besieged town, and fixed there the standard of the army. A mural crown supporting the crest, in place of a wreath, occurs in the achievements of several of the English nobility, and in various grants of arms made in the early part of the present century to officers who had distinguished themselves in the war. Viscount Beresford, in consequence of his gallantry at the battle of Albuera, obtained as crest, issuing out of a mural crown, a dragon's head with its neck pierced through by a broken spear, the head of the spear, point downwards, being held in the mouth of the dragon.

MURAT, Joaquin, king of Naples, was the son of an innkeeper at La Bastide-Fortunée, near Cahors, in France, and was born there March 25, 1767 or 1768. He was at first taught by a priest, but privately pursued the study of mathematics and of the ancient and modern languages. He was graduated at Toulouse, and entered the army, and being threatened with punishment for insubordination, deserted, and after spending some time at home, proceeded to Paris, where, it is said, he was for some time a waiter at a café, but soon obtained admission into the constitutional guard of Louis XVI. On the outbreak of the revolution, he was made a sub-lieutenant in a cavalry regiment. His gallantry and his extreme republicanisin soon won him the rank of colonel. He attached himself closely to Bonaparte, under whom he served in Italy and in Egypt, signalizing himself in many battles; rose to the rank of gen. of division (1799); returned with Bonaparte to France; and rendered him most important assistance on the 18th Brumaire, by dispersing the council of five hundred at St. Cloud. Bonaparte now intrusted him with the command of the consular guard, and gave him his youngest sister, Caroline, in marriage. Murat commanded the cavalry at Marengo, where he greatly distinguished himself. On the establishment of the French empire, he was loaded with honors. He continued to command the cavalry in the armies led by the emperor, and contributed not a little to the victory at Austerlitz, and to many other victories. In 1806 the newly-elected grand duchy of Berg (q.v.) was bestowed upon him. On Aug. 1, 1808, he was proclaimed king of the Two Sicilies by the style of Joseph I. Napoleon. He took possession of Naples, but the Bourbons, through the support of Britain, retained Sicily.

Murat possessed the qualities requisite for a gen. of cavalry rather than those of a king. He was very deficient in political skill and energy; but by the moderation of his government, he won the hearts of his subjects. Even his love of pomp and show, and the theatrical splendor of his equipment, which were a subject of mirth in France and Germany, rather gratified the Neapolitans. He endured with difficulty the yoke of Napoleon,
which left him little but the outward show of royalty. In the expedition against Russia, he commanded the whole cavalry, but on its failure, he returned to Naples, anxious and discontented. He joined the French army again in 1813, but after the battle of Leipzig, withdrew to his own dominions, determined on breaking the French fetters with which he was bound. He concluded a treaty with Austria, and a truce with the British admiral, and promised the allies an auxiliary corps. He hesitated, however, even after his new course seemed to have been decisively adopted; and finding his position insecure after Napoleon's overthrow, he entered into private communications with him at Elba. On the latter's return, he caused himself to be placed at the head of an army of 80,000 men, and commenced austy war against Austria. He was defeated at Ferrara, April 12, 1815, and again at Tolentino, May 2. With a few horsemen he fled to Naples, where all was insurrection and commotion; thence to the island of Ischia, and found his way to France, whilst his wife and children took refuge in the British fleet. After Napoleon's final overthrow, he found refuge in Corsica, from which he proceeded in a hasty manner with but a few followers to the coast of Naples, and proclaimed himself king and liberator, but was presently taken prisoner, and after trial by a court-martial, was shot in a hall of the castle of Pizzo, Oct. 13, 1815. See Léonard Gallais, Histoire de Joachim Murat (Paris, 1828), and Coletta, Histoire des Siecle dernier sous de la vie de Joachim Murat (Paris, 1821). His widow assumed the title of countess of Lipona, and resided in the neighborhood of Trieste, where she died in 1830. His two sons went to the United States, where the elder, Napoleon Achille Murat, settled in Florida, and published a number of works on the constitution and politics of his adopted country. He died April 15, 1847. The younger, Napoleon Léon Charles, married an American lady in 1827, but suffered several reverses in fortune, and Madame Murat was obliged to open a boarding-school for the support of herself and her husband. Twice he attempted to return to France secretly (in 1837 and 1844), but failed on both occasions. The revolution of 1848, however, opened the country to him. He attached himself closely to prince Louis Napoleon; and was in 1849 French ambassador extraordinary at Turin. In 1852 he was made a senator; and in 1855 he received the title of prince. The Italian revolution appeared to present some chances for him, but nothing came of these. He was made prisoner by the Germans at Meiz in 1870.

MURATORI, Ludovico Antonio, a celebrated antiquary and historian, was born at Viguola, in the duchy of Modena, Oct. 31, 1672. From a very early period, his predilection for historical and literary pursuits began to manifest itself; and, having entered into holy orders, without, however, accepting any ecclesiastical office, his life was devoted partly to the literature of his profession, but mainly to researches in history, both sacred and profane, especially the history of his native country. In his 22d year, he was appointed one of the librarians of the Ambrosian library at Milan, a post which he has since received equal celebrity from a successor not unworthy of the fame of Murat, the illustrious Angelo Mai (q.v.). Here he gave to the world his first publication, a collection of inedited Greek and Latin fragments, under the titles of Anecdotata Graeca and Anecdotata Latina. But his most import labors were reserved for the capital of his native duchy, whither, in 1700, he was recalled by the duke of Modena, to take charge of the celebrated D'Este library, and of the ducal archives; his only ecclesiastical preferment being that of provost of the church of St. Mary, at Ponsacco. From the date of his return to Modena, Muratori began to develop his later work of historical researches, the first result of which was the history of medieval Italy; and his labors in this department extended over the greater part of his life. It was not until the year 1723 that the first volume of his great collection, Rerum Italicarum Scriptores, appeared, and the work proceeded at regular intervals for nearly 30 years, the last of the 28 folio volumes which compose it bearing the date of 1751. This immense publication, which was produced by the joint contributions of the princes and higher nobility of Italy, embraces a range from the 5th to the 16th c., and contains all the chronicles of Italy during that vast period, illustrated with commentaries and critical notices. It was accompanied by a collection of dissertations illustrative of the religious, literary, social, political, military, and commercial relations of the several states of Italy during the period, in 6 vols. folio, 1738-1742, a work which, although far from being exempt from errors, is still regarded as a treasure-house of medieval antiquities. While engaged in these prodigious labors, Muratori carried on an active literary correspondence with the scholars of the various countries of Europe, and contributed essays not unfrequently to the principal historical and literary academies, of most of which he was a member. He was the first, moreover, to undertake a general history of Italy from the commencement of the vulgar era down to his own time. It is in 12 vols. folio, and still retains its value as a book of reference, having been continued by Coppi down to the year 1819. In his capacity of archivist of the duke of Modena, he compiled, in 2 vols. folio, the Antiquitates et historiae familiae d'Este (1710-40), as well as a series of historical and polemical treatises on certain territorial questions in dispute between the house of Modena and the court of Rome. To the department of classical scholarship, Muratori's collection of Inscriptions (6 vols. folio, 1739-43), which, in this particular, his work surpassed all other publications of his time, is due, and which antiquaries who had preceded him, is still acknowledged as a most important contribution; and he has also left works of standard merit in the departments of jurisprudence,
of literary criticism, of poetry, of biography, and even of the history of medical science. In the studies of his own profession, as well liturgical and historical, as dogmatical and even ascetical, Muratori, although he did not follow the method of the schools, was hardly less distinguished than if he had made these the pursuit of his life. Some of his opinions were regarded with disfavor, if not directly condemned; but his vindication of himself, addressed to the learned pope Benedict XIV., drew forth a warm and honorable testimony to the uprightness of his motives, which, without approving of the opinions to which exception had been taken, declared them free from the imputation of being contrary either to the doctrine or to the discipline of the church. Although Muratori's life was essentially that of a scholar, yet his exactness in discharging the duties of a parish priest was beyond all praise, and several of the existing charitable institutions of Pomposa were founded by him. He died at Modena, Jan. 28, 1750, in his 75th year. His works, which it would be tedious to enumerate in full detail, fill 46 vols. in folio, 34 in 4to, 13 in 8vo, and many more in 12mo. Some of these are posthumous, and were published by his nephew, G. F. Muratori, from whom we also have a life of his distinguished uncle, in 4to, printed at Oxford, 1758.

MURATORIAN FRAGMENT, or CANON OF MURATORI, a very important treatise of Biblical MSS. It probably belongs to the latter half of the 2d century. It is valuable as affording evidence concerning the writings which were regarded as canonical by the churches of that day. It contains as such the gospel of Luke—which it calls the third, the existence of the first two being implied—the gospel of John, the Acts of the Apostles, 13 epistles of Paul, 1 of Jude, 2 of John, the revelations of John and Peter; the latter, however, as being not universally acknowledged. The epistles of James and of Peter, and the epistle to the Hebrews, are omitted. It was brought into notice by Muratori, a distinguished archaeologist, at the close of the 17th century.

MURAVIEV, an ancient bojar family, originally of Moscow, which in 1488 was presented by Ivan Vasilievitch I. with large estates in the province of Novgorod. Many members of this family took an important part in the military, literary, and political history of their country during the 15th and 16th centuries. The following are the most distinguished.—(1.) Nikolai Ierofeievitch was capt. in the engineer corps, and in 1752 published the first work on algebra in the Russian language. Under Catherine II. he had charge of the Russian topographical works, became lieu.gen. and governor of Livonia, and died at Montpellier in 1770.—(2.) Mikhail Nikitiuvitch (1757–1807). At the age of 28, Catherine II. took him from the imperial guard to tutor her grandchildren, the grand dukes Alexander and Konstantin, for whom he composed works in prose and poetry distinguished for pure style and noble sentiments. In 1780 he became curator of the university of Moscow, in 1782 senator, and in 1804 censor of the state. His works were published in 1820 in three volumes.—(3.) Nikolai Nasavrovitch, privy counsellor, secretary of state, and until 1832 director of the imperial private chancery, was also known as a writer. His works are published in St. Petersburg in five volumes.—(4.) Nikolai Nikolaievitch (1768–1840). He studied at the university of Strasburg, and on his return to Russia became a lieut. in the marine service. In the battle of Rotschen sak he was wounded and taken prisoner. Set at liberty by the peace of Verone, he left the marine for the army, was appointed lieut.col., and founded near Moscow a private school for the sons of the officers of the general staff. He served in the campaigns of 1812–14 as col. and chief of staff under count Tolstoi, arranged with gen. Dumas for the capitulation of Dresden, and shortly after took part in the siege of Hamburg. He then returned with the rank of maj.gen. to his school, which in 1816 was declared to be imperial, and which he directed until 1823. During the last years of his life he became interested in agricultural pursuits and rural economy. He was one of the founders and most active members of the economic society of Moscow, and published a translation of Thuner's Principles of Rational Agriculture. He left five sons, all of whom became distinguished.—(5.) Alexander Nikolaievitch (1792–1864), the eldest son of the preceding. In 1825 he took part in the conspiracy which broke out at the accession of Nicholas I. In consideration of his father's services his life was spared, and he was merely exiled to Siberia. Though he was afterwards permitted to return, his services were not required until the Crimean war, when he became maj.gen. and in 1856 governor of Novgorod. He was interested in the emancipation of the serfs. At the time of his death he was lieu.gen., and member of the senate of Moscow.—(6.) Nikolai Nikolaievitch (1793–1866). He entered the army in 1810, took part in all the campaigns of 1812–15, and won distinction for bravery at Borodino, Lutzen, Bautzen, Kulm, Leipzig, and under the walls of Paris. In 1817 he was attached to gen. Iermoloff's staff, and served in the Caucasus. In 1827 he published his Tavleb in Turkmannia and Khiva, which was translated into German, English, and French. In 1827 he became chief of staff under gen. Paskevitch, took part in all the principal battles of the war with Persia, was promoted to the rank of maj.gen., and won great distinction at Kars and Akhalzik in the war of 1828. In 1830 the Polish rebellion broke out, and Muraviev was recalled from an expedition against the Leshyegians to take command of the Lithuanian grenadier brigade, with which he defeated the old Polish gen. Sievaski, near Kazimierz. Promoted to the rank of lieu.gen., he commanded the right wing at the storming of Warsaw in 1831, and captured the fortifications of Rakovice. At the end of the next year he was sent to Egypt with special
Instructions to incite Mehemet Ali to revolt against the Turkish government. He then took charge of the Russian forces which landed on the shores of the Bosporus. In 1838 he fell into disgrace, and lived secluded for ten years, at the end of which he was called again into active service, and in 1854 was made commander of the expeditionary forces in the Caucasus. After a siege which lasted from the first of June till the last of November, he captured the important fortress of Kars. This victory, which partially redeemed the loss of Sevastopol, brought Muravief the title of prince and the appellation Karski. He was then made a state counselor, and put at the head of the commission to investigate the abuses committed during the Crimean war. In 1861 he was made chief of the regiment of grenadiers of Samogitha, one of the greatest honors which the czar can accord to generals not belonging to the imperial family.—(7.) Michael Nikolaievich (1796-1866). At the age of 15 he was acting professor in the military school founded by his father. In 1813 he fought against the French, and at the conclusion of the campaign returned to his favorite study of mathematics, and translated into Russian Garnier's *Géométrie Analytique*. In 1825 he entered the army, and soon became colonel. In 1831 he advanced from major-gen. to the military governorship of Grodno, and showed great activity in repressing the troubles which broke out in his province after the Polish revolution. He afterwards became military governor of Kursk, and entered the civil administration as privy councilor and senator. He was elected president of the Russian geographical society, and caused a great scientific expedition to be sent to Siberia. In 1837 he became minister of the crown lands and president of the council for the administration of the appanages of the state. He devoted his energies to the fostering of agrarian and commercial interests, and presented his country with a specious academy near Petrograd, but was afterwards expelled from the country, and consequently from the army, for his advocacy of the liberation of the serfs. In the student riots of 1861 he used such cruel modes of repression as to win universal hatred, and was removed from his functions. The Polish insurrection, however, brought him to the fore, and in 1863 he was named governor-general of Vilna with special honors. He acted with such energy that in a few months the insurrection was entirely put down. The czar, in recognition of his services, made him a count and placed him at the head of the commission to seek out and punish the accomplices of Karakasof, who attempted the assassination of Alexander II., in 1866.—(8.) Nikolai Nikolaievich, b. 1810; entered into the army, served in the Caucasus, and by his bravery won the rank of major-gen. and commander of the coats of the Black sea. In 1847 he was named governor-general of eastern Siberia and made lieu-gen. He gained for Russia the entire territory of the Amur, and concluded the treaty of Algan, May 28, 1858, by which this country was definitely ceded by China. His services were rewarded by the title of count and the name Amur-ski. In the summer of 1859 he went with twelve ships to Yedo, and concluded a favorable treaty with Japan. He then returned to St. Petersburg by way of Siberia. He resigned his governorship in 1861, and was named member of the imperial council.—(9.) Andrei Nikolaievich entered at an early age, the civil administration; became counselor and kammerjunker, and about 1830 undertook a journey to Syria and Palestine, which he described in his *Pilgrimage to the Holy Places*. He subsequently traveled in his own country, in Italy, and in the East, and published the results of his observations in several volumes. He wrote also besides many theological and dramatic works,—a *History of the Bible, History of the First Four Centuries of Christianity, History of Jerusalem, History of the Russian Church, Description of Rusia*, which was a member of the Holy synod.—A branch of the Muravief family, about 1730, married a daughter of Apostol, the betroth of the Cossacks, whose name was added to his own.—(10.) Ivan Matveievich Muravief-Apostol (1769-1851). Under the emperor Paul, Ivan was sent to the courts of Saxony and Madrid, and on his return became privy councilor and senator. He had a thorough knowledge of the ancient and modern languages, and translated into Russian Sheridan's *School for Scandal*, the *Satires* of Horace, and the *Clouds* of Aristophanes. In 1820 he traveled in the Taurid, and published the results of his archaeological investigations. His old age was saddened by the political ruin of his three sons, whom he survived for more than a quarter of a century.—(2.) Sergii Ivanovitch was lieu-col. of the regiment of Teherunigof, a man of remarkable energy and learning, and the leading spirit in the Dekabrist conspiracy of 1825. Despite the news of the failure of the rising in St. Petersburg, he proclaimed the great duke Konstantin emperor, and seized the town of Vasiliev-Town. He was sent against him, and, after a gallant resistance, in which he was wounded and his brother Ippolit was killed at his side, he was captured, taken to St. Petersburg, and hung in July, 1826. His other brother Matvei was also a Dekabrist, and was sent to Siberia for twenty years.

MURCHISON, CHARLES, 1820-79: b. Jamaica, of Scotch descent. He studied at the university of Aberdeen from 1845 to 1851, obtaining a prize for Greek scholarship, the Balfour medal for skill in plant dissection, and the Thompson prize. After graduating at the medical school in 1851 with high honors, he went to Turin, as physician to the British embassy. On his return in 1852 he resided a short time in Edinburgh, studied in Dublin and Paris, and then accepted the position of professor of chemistry in the Calcutta medical college. He remained in India until 1855 and published a treatise on the diseases of that country. He then returned to England, and in London was connected as lecturer, demonstrator of anatomy, assistant physician, or managing physician with the Westminster general dispensary, St. Mary's, King's College, Middlesex, and the

U. K. X.—20
London Fever hospitals. Besides many medical and scientific contributions to the *Lancet* and other journals, he published several treatises, the most important of which were *Diseases of the Liver and Continued FEVERS of Great Britain*. In 1871 he was appointed professor of the principles and practice of medicine, and though his practice was very large and his published works of great scientific value, yet probably his highest claim to fame arises from his precision, power, and thoroughness as an instructor. In 1877 he was made president of the pathological society. His death was caused by heart disease, resulting from a fever contracted in his professional duties. Though for several years aware that continued rest alone could avert a sudden death, he in no way relaxed his labors, and died in his consultation room.

**MURCHISON**, Sir Roderick Impey, geologist and geographer, was born at Tarradale, Ross-shire, in 1792. He was educated at the grammar-school, Durham, and having a bias for military life, next studied at the military college, Marlow. He entered the army at an early age, and served as an officer in the 36th regiment in Spain and Portugal. He was placed on the staff of his uncle, gen. Sir Alexander Mackenzie, and Murchison, in his turn, was engaged in the discovery of gold in Australia. In 1846, six years before that metal was practically worked, he addressed a letter to the president of the royal geological society of Cornwall, inciting the unemployed Cornish tin-miners to emigrate and dig for gold in Australia. He was elected president of the British association for the advancement of science in 1846; president of the royal geographical society in 1844 and 1815; was re-elected in 1857, and continued to hold that post till 1870, when he was compelled to resign it by paralysis. His anniversary addresses to the geographers were of great interest and value. Perhaps no man of the present century has done more to promote geographical science at home, and kindle the spirit of adventure among those engaged in Arctic explorations on the one hand, and African discovery on the other. In 1855 he succeeded Sir H. de la Beche in the office of director of the museum of practical geology. He was a D.C.L. of Oxford, L.L.D. of Cambridge, and a vice-president of the royal society. He was knighted in 1846, made K.C.B. in 1859, and a baronet in 1869. From the emperor of Russia he received the Grand Cross of the order of St. Alexander, also that of St. Stanislaus, Dec. 22, 1871. The greater portion of his contributions to science were published in the *Transactions* of the geological and other societies. His principal works were *The Silurian* (1836); *The Geology of Russia in Europe and the Ural Mountains*, in 1845 (2d ed. 1853). He also published volumes on the *Tertiary Deposits of Lower Syria*, etc. (1836), the *Geology of Cheltenham* (1834), etc.—See *Life of Sir Roderick Murchison*, by Archbishop Geikie, L.L.D. (1875), and obituary notice by sir Henry Rawlinson in *Proceedings of the Royal Geological Society*, vol. xvi. No. 4.

**Murchisonia**, a genus of fossil gasteropods mollusca belonging to the family *Haliotidae* and so named in honor of sir R. I. Murchison. The genus consists of at least 50 species, all of which are characteristic of the paleozoic rocks, occurring in the series from the lower Silurian up to the permian. The shell differs from the large genus *Plerotomaria* only in being very much elongated. Like it, the whorls are sculptured and zoned, the aperture is channelled in front, and the outer lip is deeply notched.

**Murcia**, a former province of Spain, now subdivided into the smaller provinces of Albacete and Murcia, is situated in the s.e. of the peninsula. It is bounded on the n. by New Castle, on the e. by Valencina, on the s. by the Mediterranean, and on the w. by Granada, Andalusia, and New Castle. Area, 10,311 sq. miles. Pop. 70, 660,940 (of modern province; 439,067). In the n.e. the province is partly level; but in the s.w. it is composed of great valleys, high plateaus, and mountain ranges. The coast comprises sandy shores and coves. The principal river is the Segura, which flows through the middle of the province from w. to e. On the whole, Murcia is not very productive, and never will be, on account of the failure of water, partly caused by the destruction of the forests. The only fertile districts are the valleys of the Segura, and the side-valleys of Lora, Albacete, Chinchilla, and Almansa. The Esparto wastes have remained uncultivated since the banishment of the Moriscos in 1610; and the canal of Murcia, which is intended to irrigate the arid Campo de Cartagena, is not yet finished. Murcia is one of the most thinly peopled districts of Spain. The north yields wheat and barley; the south maize, fruits, wine, oil, silk, and hemp. Goats, sheep, and swine are reared in great numbers.
In metals, salt, and mineral springs Murcia is abundant; it has also many smelting works for iron, lead, and copper ores, brimstone, and alum. The roads, however, are in the most wretched condition, and industry in general is still in a backward state. The province was frightfully devastated by a great earthquake, 18–21 March, 1829. Murcia was conquered by the Arabs in 711; after the fall of the caliphate of Cordova it became an independent Arab kingdom, but six years afterwards was subjugated by king Ferdinand III. of Castile in 1241.

**MURCIA** (the Roman Murgii), a large, important, and ancient town of Spain, capital of the province of the same name, on the left bank of the Segura, and near the junction of that river with the Sangenora, 50 m. s.w. of Alicante. It stands in the midst of a beautiful and luxuriantly productive huerta or garden, 16 m. in length, and from 7 to 8 m. wide. The huerta forms a portion of what is called the vale of Murcia; is well watered, has a bright green appearance even in winter; produces wheat, flax, pulse, and vegetables, and grows innumerable mulberry, orange, fig, and palm trees. The streets of Murcia are narrow but clean, and the houses are gaudily painted in pink and yellow. Its squares are filled with cypress, orange, lemon, and other southern trees. It is the see of a bishop suffragan to Toledo; the cathedral is surmounted by a tower begun in 1529, completed in 1766, and crowned by a dome from which a magnificent view is obtained. The city contains few objects of fine art, a circumstance which is accounted for by the fact that, on the occasion of its siege by Sebastian, that general, after promising that persons and property should be respected, entered the town April 23, 1810, and riled it of its wealth and art-treasures. Silks, linens, baskets, mats, and cordage are manufactured, and oil-mills, tanneries, and other works are in operation. Pop. 80,000. 

**MURDER** is the crime of killing a human being of malice aforethought, and is punishable with death. It is immaterial what means are employed to effect the object. Blackstone says that the name of murder, as a crime, was anciently applied only to the direct killing of another, which the word *moerda* signifies in the Teutonic language. And among the ancient Goths in Sweden and Denmark the whole vill or neighborhood was punished for the crime, if the murderer was not discovered. Murder is defined by Cokethus: “When a person of sound memory and discretion unlawfully killeth any reasonable creature in being, and under the king’s peace, with malice aforethought, either express or implied.” Almost every word in this definition has been the subject of discussion in the numerous cases that have occurred in the law-courts. The murderer must be of sound memory or discretion; i.e., he must be at least 14 years of age, and not a lunatic or idiot. The act must be done unlawfully, i.e., it must not be in self-defense, or from other justifiable cause. The person killed must be a reasonable creature, and hence killing a child in the womb is not murder, but is punishable in another way (see INFANTICIDE). The essential thing in murder is that it be done maliciously and deliberately; and hence, in cases of hot blood and scuffling, the offense is generally manslaughter only. Killing by dueling is thus murder, for it is deliberate. It is not necessary, in order to constitute murder, that the murderer kill the man he intended, provided he had a deliberate design to murder some one. Thus if one shoots at A. and misses him, but kills B, this is murder, because of the previous felonious intent, which the law transfers from one to the other. So if one lays poison for A. and B, against whom the poisoner had no felonious intent, takes it, and is killed, this is murder. Formerly, in England, the benefit of clergy (q.v.) was allowed in cases of murder, till it was abolished by 7 and 8 Geo. IV. c. 28. The only sentence on murderers is now death, which is carried out by hanging. Formerly the murderer was directed after death to be hung on a gibbet in chains near the place of the crime. Formerly, also, dissection was added as part of the sentence, and the execution was to take place on the day next but one after sentence. But now an interval of a fortnight usually takes place, and the body is buried in the precincts of the prison. Attempts to murder were only until recently punishable in England like capital felony; but now attempts to murder are punishable only with penal servitude for life, or for not less than three years.

**MURDER (ante).** The common law inferred a wrongful intent from the mere fact of the killing, so that the burden lay upon the defendant of establishing his innocence of malice. Under the definition “with malice aforethought, express or implied,” many kinds of homicide which are now considered to involve a much smaller degree of guilt, were classed under the one head of murder. By the common law it was murder to secure by perjury the conviction of an innocent person upon a capital charge; but at the present day such a crime would be considered only as a perjury which should receive an aggravated punishment. At the common law, too, the procuring of a person to commit suicide was murder if the suicide was accomplished. So it is said in the books that if two persons agree to commit suicide, and attempt to carry their design into execution, but only one dies, the survivor is guilty of murder if he were present at the commission of the suicide; otherwise he is an accessory before the fact. Both would probably now be considered as simple manslaughter. According to Hale in his *Pleno of the Crown*, if a person by threats or otherwise cause the death of another by putting him into “a passion of grief or fear,” the former is guilty neither of manslaughter or murder; and such is, probably, still the law, though it has been doubted. If a number of persons conspire to commit an unlawful act, in the execution
Murdoch.
Munger.

308

of which murder is committed, they all are guilty of murder. The only compulsion
which can excuse a murder must be an irresistible violence, such as would put a man of
discretion and courage into fear for life or limb. There has been considerable contro-
versy as to the burden of proof in cases of murder, and it has sometimes been held that,
after the prosecution has shown that the death was caused in the indictment was caused
by the prisoner, the burden of proof then rests upon him to show justification or want of
malice. The evidence relied upon may of course be either direct or circumstantial. In
most of the states murder is divided into degrees, and only murder in the first degree is
punished capitally. Murder committed deliberately with express malice aforesaid, and
murder committed, to use the words of the Massachusetts statute, "in perpetrating
or attempting to perpetrate, any crime punishable with death, or imprisonment for life,"
is murder in the first degree; all other murder is in the second degree. The special classes
of crime, outside of deliberate premeditated killing, which will constitute murder in the
first degree, vary somewhat according to the statutes of each state.

MURDOCK, JAMES, D.D., 1776–1856; b. Conn., of Scotch-Irish descent. At the age
of 14 he was left an orphan; graduated at Yale college in 1797; studied theology with
Dr. Dwight; was for a short time principal of Hopkins grammar school, New Haven,
and for a year of Oneida academy, N. Y.; licensed to preach in 1801; was pastor of the
Congregational church in Princeton, Mass., 1802–15; professor of ancient languages
in the university of Vermont, 1815–49; professor of sacred rhetoric and church history in
the Andover theological seminary 1819–28. In 1829 he removed to New Haven and
devoted himself to literary work. His published works are two discourses on the atone-
ment in the New Testament, Murdock's Evidences of Dogmatic History; a translation of
Wilmot's Institutes of Ecclesiastical History, 3 vols.; Sketches of Modern Philosophy; a Congre-
gational Catechism; translation of Mosheim's Commentaries, etc.; The New Testament; a
Literal Translation from the Syriac Pesitto Version—the latter a very serviceable work.
He was an eminent linguist and philologist, and contributed many articles to theological
reviews.

MURDOCK, JAMES EDWARD, b. Philadelphia, 1811; appeared first as an actor in
Philadelphia in 1829. In 1833 he appeared with Miss Fanny Kemble, and from that
time was a leading actor in tragedy and comedy. In 1838 he left the stage, and opened
a school in Boston for mental and physical culture. Returning to the stage he visited
California in 1855. In 1855 he went to Europe, and played at the Haymarket theater
with great applause. In 1857 he returned to the United States. He has distinguished
himself as an elocutionist, and in conjunction with William Russell published Orthophony,
or Culture of the Voice. He was on the staff of gen. Rousseau in the war of the rebellion,
attending specially to the sick and wounded; also he gave popular readings in many
parts of the country for the benefit of the U.S. sanitary commission. Since the war he
has resided in Philadelphia.

MURE, WILLIAM, 1759–1869; b. Scotland; educated at Westminster school and at
the university of Edinburgh; subsequently studied several years in Germany, and became
a thorough classical scholar. His articles in the Edinburgh Review on the literature of
modern languages were pronounced brilliant by Moore and Jaffrey. He published Brief
Remarks on the Chronology of the Egyptian Dynasties; A Dissertation upon the Calendar of
the Zodiac of Ancient Egypt. In 1842 he published a Journal of travels in Greece and the
Ionian islands, and portions of a Critical History of the Language and Literature of Ancient
Greece, 5 vols. He also edited the Caldwel Papers, 3 vols. He represented Renfrew-
shire in parliament in 1846–55, and was lord rector of Glasgow in 1847–48.

MURET, or MURETUS, MARC ANTOINE, 1528–85; b. France; became a proficient
scholar in Greek and Latin; and when but 18 lectured on Terence and Cicero in the col-
lege of Auch. In 1541 he went to Venice, where he became a friend of Paolo Manuzio,
who published some of his books. In 1559, at the invitation of the cardinal Ippolito
d'Este, he took up his residence in Ferrara; with him he came to Rome, where he enjoyed
the favor of Pius V. and Gregory XIII. He entered the priesthood, was presented to a
number of livings, and at the time of his death was professor of civil law. His principal
works are Commentaries de Origine Jure, Commentarium de Legibus, etc., and Novae inInsti-
tentia Institutiones. In one of his Opinions he exerts Charles IX. of France for having
destroyed the Protestant heresy. His Latin poems are fluent and polished, but show
little poetical talent. His commentaries on various classical authors are of considerable
value.

MUREX, a Linnean genus of gastropodous mollusks, of which has now been formed
the family muricidae, belonging to the order pectinibranchia of Cuvier. The sexes are dis-
tinct; the animal has a broad foot, often much expanded; the eyes are not on stalks;
the shell has a straight canal in front, often prolonged through part of a very long beak;
no canal behind. The muricidae all prey on other mollusks, boring through the shells
with their hard-toothed proboscis. The name Rock-snail is often given to many species
of murix; and some, from the length of the beak, are called Woodcock-snail. Some
have the shell beset with long and regularly arranged spines. The whorls of the shell
are marked with ridges, or carices. Some species are found in all parts of the world; the largest are tropical. The ancients
obtained their purple dye (see Tyrian Purple) from species of murex, particularly M. trunculus and M. brandaris. The Venet's Comb of the Indian seas is M. tribulus, a very delicate and beautiful shell, with many long thin spines. Fossil murexides are numerous, but are scarcely found in any formation older than the oocene tertiary.

Murexide, purpurate of ammonia, or Roman purple, a curious coloring matter obtained from guano. It is similar to the purple dye or Tyrian purple of the ancients, which was made from a species of murex—hence its name. Murexide is a product of uric acid, and as this exists in abundance, and in a very free state, in guano, that material has been found one of the best sources from which to obtain it. One process used by Mr. Ramsey of Manchester, the chief manufacturer of this material, to produce murexide, is to dissolve uric acid in dilute nitric acid, and after evaporating for some time at a temperature a little short of boiling, whilst still hot, to add a slight excess of ammonia. Two compounds are formed by this process, alloxan and alloxantin, and their mutual reaction on each other results in the formation of the beautiful minute green metallic-lustered crystals of murexide, which, in combination with some of the compounds of lead and mercury, yield most brilliant red and purple dyes. The use of murexide was becoming extensive until the discovery of the aniline colors, the greater brilliancy of which has checked its employment. Murexide is used in printing both cotton and silk goods, which, under the name of the "Roman-purple style," has been brought to great perfection by several large firms.

Murfreesboro', a t. in Rutherford co., Tennessee; pop. 3,502; distant 32 m. from Nashville, on the Nashville, Chattanooga and St. Louis railroad. Its situation is attractive and healthy, on an extended tract of level land, the soil fertile, and the climate salubrious. For 10 years, 1817-27, it was the capital of the state. Union university, a Baptist institution founded in 1841, is situated here; there is also an important college for girls.

Murfreesboro', Battle of, known also as the battle of Stone River, began on Dec. 31, 1862, and ended Jan. 4, 1863, with the flight of the confederates, and the occupation of the town by the union forces. The latter had been reorganized at Nashville by gen. Rosecrans, and left its position on Dec. 26: forming its line of battle, after a march of five days and constant skirmishing, on the w. bank of Stone river, the left under Crittenden resting on the right, and Thomas the center. The confederate army, under gen. Bragg, was in position on the e. side of Stone river, Breckenridge holding the right of the line, Polk the center, and Hardee the left. The battle began on the morning of Dec. 31 with a sharp attack by Crittenden on the enemy's right; but Rosecrans's plans were at once disturbed by his own right being driven in by the confederate left under Hardee. This movement necessitated the abandonment of the original design, and Rosecrans drew in his lines to support the center and right of his position, which became heavily engaged. The union line had lost its ground and 28 pieces of artillery, when nightfall put an end to the fighting for that day. Jan. 1 passed without any serious engagement, but on the afternoon of Jan. 2 the confederates made an attack in force, which was repulsed, and their lines were in turn driven in and badly broken up. There was no fighting on the 3d, and on the following day the confederates evacuated Murfreesboro'. The union strength in this battle was 48,400 men; loss, 1,553 killed, 7,245 wounded, 3,000 prisoners. The confederates lost 10,000 killed, wounded, and missing out of 35,000 men.

Murgab, a river of Central Asia, which rises on the northern border of Afghanistan, in the Hindu Kush, immediately to the n. of the sources of the Heri, (q.v.). The Murgab flows westward, then north-westward, and finally northward, passing from amongst the mountains in which it has its source into the desert plains of Turkestan, where the volume of its water gradually diminishes, until it finally loses itself in a swamp in the sandy plain of Merv, after a course of about 400 miles. In the upper part of its course it receives many tributaries, but none in the lower. The most noteworthy place on its banks is Merv, or Merna (anc. Antiocheia Margiana), a town of independent Turkestan, about 300 m. s.e. from Khiva. Merv was an important town in the days of the Seljuk dynasty, of which it was the capital, but is now very ruins.

Murger, Henry, 1822-61, b. Paris; received a rudimentary education, and in 1838 became secretary to count Tolstoy, a wealthy Russian nobleman residing in Paris. While in his employ he became ambitious to become a writer, and began by composing satirical poetry. Uniting with a number of young artists, authors, and others of tastes similar to his own, he formed the irregular society or club to which he gave the name 'Bohemia'; the associates being termed Bohemians, from their vagrant, gypsy life. They were adventurous and often brilliant, and bound by no ties, social or other. They soon made a name for themselves in Paris, and eventually in general literary history; on account of these features of their character and lives. Murger's reputation was established by the publication, in 1848, of his Scènes de la Vie de Bohême, a strikingly characteristic work, marked by independent thought, vigorous language, and occasional pathos. He contributed romance, to the Revue des Deux Mondes, and published Les Nuits d'Hiver, a volume of poems, besides writing small pieces for the Luxembourg theater.
MURIATIC ACID. See Hydrochloric Acid.

MURIDE, a family of rodent quadrupeds, containing many genera and a very large number of species, distributed over all parts of the world, and of which rats and mice may be regarded as typical examples. To this family belong also voles, lemmings, dormice, jerboas, marmots, etc. The muridae are of the section of rodents having distinct clavicles. They have three or four molars on each side in each jaw, the molars at first furnished with rounded tubercles, which wear down till they exhibit mere roughened crowns. The typical muridae, and those most nearly allied to them, have scaly tails. Marmots, dormice, jerboas, etc., have hairy tails. There are great diversities in structure and habits among the muridae. All of them feed on vegetable food, but many of them are ready also to eat animal substances. The limits of the family muridae are very differently stated by different naturalists.

MURIDE. (ante). The classification of this family of rodents varies. The marmots are there referred to the family, while by many they are placed in the family sciuridae (squirrels). See Murdor, ante. Again, pouched rats, and North American gophers are classed with some by the muridae, but by others are placed in the family sceuridae. See Gopher. Jerboas are now generally regarded as constituting the family Dipodidae, instead of being confined to the genus dipus, of family muridae. See Jerboa, ante. The family muridae according to general consent, comprises rats, mice, lemmings, hamsters, muskrats or musquash and voles. See Rat, Mouse, Lemming, Hamsters, Musquash, and Vole, ante.

MURILLO, Bartolome Esteran, was b. at Seville, and baptized Jan. 1, 1618; and after receiving some education, was placed with his relative, Juan del Castillo, to study painting. Having saved a little money, which he made by painting religious pictures for exportation to South America, he went to Madrid in 1641, being then in his 24th year, was favorably noticed by his celebrated townsmen, Velasquez, and through his influence, was enabled to study the chefs d'oeuvre of Italian and Flemish art in the royal collections. In 1645, he determined to return to Seville, though advised to proceed to Rome by Velasquez who offered him letters from the king. After settling in Seville, he received numerous important commissions, and was soon acknowledged as the head of the school there. In 1648, Murillo married a lady of fortune; he now maintained a handsome establishment, and his house was the resort of people of taste and fashion. The academy of Seville was founded by him in 1660, but he filled the office of president only during the first year. He fell from a scaffold when painting in Cadiz on an altar-piece for the church of the capuchins, returned to Seville, and soon after died from the injury he received, April 3, 1682. In early life, he painted many pictures illustrative of humble life; in these, the manner was darker and less refined than that exhibited in his later pictures, which are mostly scriptural or religious pieces. In the Louvre, and in England, there are about forty of his works. Sir David Wilkie, who greatly admired and carefully studied the Spanish school, has remarked, in reference to it: "Velasquez and Murillo are preferred, and preferred with reason, to all the others, as the most original and characteristic of their school. These two great painters are remarkable for having lived in the same time, in the same school, painted for the same people, and of the same age, and yet to have formed two styles so different and opposite, that the most unlearned can scarcely mistake them; Murillo being all softness, while Velasquez is all sparkle and vivacity."

MURRO, an episcopal t. of s. Italy, in the province of Potenza, 17 m. n.w. of the t. of Potenza. Its castle, built on a height overlooking the ravine, was the scene of the murder of Joanna L., queen of Naples. Pop. 8,388.

MUROM, or Moonom, a t. in the s.e. of the government of Vladimir, in European Russia, 70 m. e.s.e. of Vladimir, and situated on the right bank of the Oka, a tributary of the Volga. Pop. 67,112. The chief industrial establishments are tanneries and sailcloth and linen factories. The fisheries on the Oka supply the surrounding country. Murom is also noted for its orchards and kitchen-gardens, the latter of which supply a great portion of Russia with cucumber-seed of the first quality. Gypsum quarries in the neighborhood are extensively worked during winter. There is a large trade in wheat, flax, linseed, and timber. Murom has a very picturesque appearance, and was formerly surrounded by impenetrable forests. It is frequently mentioned in the old national ballads, and is one of the most ancient towns of Russia.

MURPHY, Arthur, 1727-1805; b. in county Roscommon, Ireland; educated at St. Omer's college (1740-47), and spent two years in Cork in business. He then went to London and entered upon his career as literary man, dramatist, and actor. From 1752 to 1754 he published a periodical called The Gravy's Inn Journal, and afterwards a political journal, The Test, both unsuccessful. As an actor he appeared at Covent Garden and Drury Lane theaters, but did not meet with much favor. He now adopted the study of law and began practice in 1757, but once more with little success. He had already published a farce, The Apprentice, which had some popularity, and now occupied himself entirely in writing farces and comedies. In this he gained some wealth and a high reputation as a dramatist. Among the most successful of his pieces were: The Upholster; The Way to Keep Him; All in the Wrong; and Know your own Mind. In 1792 he
published an essay on Dr. Johnson, and soon after a translation of Tacitus; his life of Garrick was printed in 1801. A few years before his death a pension of £200 and the office of commissioner of bankrupts were bestowed on him by the English government.

MURPHY, Henry Crude, b. Brooklyn, N. Y., 1810; graduated at Columbia college in 1830; studied law, and was admitted to practice in 1833. He was made city attorney of Brooklyn, and was elected mayor in 1842. He was chosen to congress in 1843; and continued a member of that body during the next six years; being also a member of the N. Y. state constitutional convention in 1846. In 1857 he was appointed minister to Holland, where he remained until 1861, and where he added to his already comprehensive knowledge of Dutch history in its relation to that of the state of New York. He has gained distinction, both for his research and his literary skill in this department. He contributed to the periodicals in early life, and translated important writings from the Dutch for the N. Y. Historical Collections. He also translated, and published in 1836, specimens of the writings of the early Dutch poets of New Netherlands. Mr. Murphy has filled the position of president of the New York and Brooklyn bridge company from its formation.

MURRAY is the generic term loosely used to designate a variety of diseases of domestic animals, but more correctly restricted to the vesicular epizootic, popularly known as the mouth and foot disease. It is a contagious eruptive fever, affecting cattle, sheep, pigs, and poultry; but rarely communicable to horses or men. It is characterized by the appearance of little bladders or vesicles in the mouth, on the lips, gums, and tongue; on the udder, and in the interdigital space; causing inability to eat, and draining of saliva, heat and swelling of the udder, and lameness. The disorder runs a fixed and definite course usually in eight or ten days. Good nursing, comfortable lodgings, and a liberal supply of soft, easily digestible food, are the chief requisites for speedy recovery. A laxative may be given if needed. The mouth may be washed out twice daily with a mild astringent solution, which may be made with half an ounce of alum, oxide of zinc, or sugar of lead, to the quart of water. The udder in milch cows, in which the complaint is usually most serious, should be bathed with tepid water before and after milking, which must be attended to very regularly; and the feet kept clean, and washed occasionally with the lotion used for the mouth.

MURRAY, a co. in n.w. Georgia, adjoining Tennessee, bounded on the s.e. by the Coosawattee river, and on the w. by the Comassanga; 150 sq.m.; pop.'80, 8,269—8,257 of American birth, 907 colored. The surface is irregular and mountainous, and much of it is covered with timber. The soil in the lower lands is fertile, and produces large crops of Indian corn, wheat, and oats. Smaller crops of tobacco and cotton are raised, and considerable molasses is made from sorghum. Co. seat, Spring Place.

MURRAY, a co. in s.w. Minnesota, drained by Shetek lake in the n., lake Talcot in the s., and other small lakes; 720 sq.m.; pop.'80, 3,604—3,397 of American birth. It is drained by the Des Moines and Rock rivers, the Channammbe and Okisda creeks. Its surface stretches out into broad level prairie land, tillable and adapted to grain culture, but nearly destitute of timber. It produces wheat, Indian corn, and oats; and furnishes good pasturage through the year. Co. seat, Currie Court-House.

MURRAY, Alexander, 1755—1821; b. Md.; went to sea as a boy, and when not yet of age was in command of a merchant vessel. In 1776 he was commissioned lieutenant, in the navy of the United Colonies, and, no vacancy then existing in the list of ships afloat, he served until the end of 1777 in the army as lieut., and capt., and was present at the battles of Flatbush and White Plains. In the year last named he took command of a privateer, and on several letters-of-marque distinguished himself in many naval combats. He was taken prisoner, exchanged, and served as lieut. in the Trombitt, and in the engagement with the Iris was severely wounded and again made a prisoner, exchanged, and once more joined the service as lieut. of the frigate Alliance. In all he was in more than 13 battles on land and sea. He became captain in 1798, and commanded the Montezuma and Constellation, being engaged with the latter in the Tripoli war. For some time before his death he had command of the Philadelphia navy-yard.

MURRAY, Alexander, d.d., 1775—1813; b. Scotland; son of a shepherd. In his early life he showed a great desire for learning, and by the family hearth in the evening or amid his flock on the hill-side during the day he read with avidity the few books in his father's house. In 1789 he attended a school at Minigaff. The next five years were spent in school in summer, teaching the children of the neighboring families in winter. Books were bought or borrowed; grammars and dictionaries of several languages were studied. He obtained a knowledge of the French, Latin, Greek, and Hebrew languages, and of the Anglo-Saxon, Welsh, and Arabic alphabets, and wrote a volume of poems. At the age of nineteen he entered the university at Edinburgh through the assistance of the rev. Dr. Baird of that city, who had heard of his remarkable proficiency. At the end of two years he began to study for the ministry. He contributed several articles to the Edinburgh Review. He learned thoroughly the seven European languages, and the Geez, Amharic, and Abyssinian dialects. The knowledge of the latter prepared him to edit Bruce's Travels, and in three years the edition appeared
in 7 vols., with a life of the author, and copious philological and antiquarian notes. In 1806 he was ordained and installed assistant and successor to the minister of Urr in the stewardship of Kirkcudbright. In 1811 he was employed to translate a G eezi letter, which had been sent to the king from the governor of Tigré. In 1813 he was elected professor of oriental languages in the university of Edinburgh. During that year he published a small work entitled Outlines of Oriental Philology, comprehending the Grammarized Privates of the Hebrew, Syrian, Chaldee, Arabic, and Abyssinian languages. He now began a work entitled History of the European Languages, or Researches into the Affinities of the Tenitore, Greek, Celtic, Slavonian, and Indian Nations, but before the end of the first session, his health which had been feeble for some time, utterly failed, and he died in the 37th year of his age.

MURRAY, Alexander, b. Paul, 1816; entered the navy in 1835, and was made lieutenant in 1847. During the Mexican war he was stationed on the coast of Mexico, was wounded at Alvarado, and took part in the capture of Vera Cruz and Tabasco. He was attached to the coast survey 1846–9, and 1857–9. He became a commander in 1863, and the same year was in the engagements off North Carolina—Roanoke island, Newbern, Kinston, etc. In May of that year he led a naval expedition up the Pamunkey and York rivers. He was made commodore in 1871.

MURRAY, David, Ph.D., L.L.D.; b. Delhi, N. Y., 1829; graduated at Union college 1852; was professor and principal of the Albany academy 1853–63; and 1863–73 professor of mathematics and physics in Rutgers college. In 1873 he went to Japan as an expert to advise the Japanese government in regard to educational methods, where he still remains. He published Manual of Land Surveying, contributed to Mori's Education in Japan, and was the editor of Outline History of Japanese Education.

MURRAY, or Moray, James Stewart, Earl of, sometimes called the "Good Regent," was the natural son of James V. of Scotland, by Margaret, daughter of John, fourth lord Erskine, afterwards wife of Sir Robert Douglas of Lochleven. He was b. about 1531, made commendator of the priory of St. Andrews in 1538, and subsequently of the priory of Macon (in France). He joined the reformers in 1556, and almost immediately became the chief of the Protestant party in Scotland. In 1561 he was sent to France, to invite queen Mary to return to her kingdom; and on her arrival he became her prime minister and adviser. In Feb., 1562, he was created earl of Moray, but that earldom having been claimed by lord Erskine, the title of earl of Moray was conferred upon him instead a few months afterwards. Strongly opposed to the marriage of Mary with lord Darnley, July 29, 1565, he endeavored to oppose it by an appeal to arms; but he was easily put to flight by the queen, and obliged to take refuge in England. He did not return to Edinburgh till March 10, 1566, the day after the assassination of Riccio, in which he was an accomplice. In April, 1567, he went to France, but was recalled in August of the same year by the lords in arms against the queen, when he found Mary a prisoner in Lochleven, and himself appointed regent of the kingdom. After the escape of the queen he defeated her forces, May 13, 1568, at Langside, near Glasgow, and was afterwards one of the commissioners sent to England to conduct the negotiations against her. By his prompt and vigorous measures, zeal, and prudence, he succeeded in securing the peace of the kingdom, and settling the affairs of the church, but was assassinated at Linlithgow by Hamilton of Bothwellhaugh, Jan. 23, 1570.

MURRAY, John, the name of three generations of English publishers, will forever remain associated with the palmiest days of English literature in the 18th and 19th centuries. The founder of the house, John M.Murray, was born in Edinburgh about 1745. He obtained a commission in the royal marines in 1762, and in 1768 was still second-lieutenant, when, disgusted with the slowness of promotion, and panting for a more active career, he purchased the bookselling business of Mr. Sandby, opposite St. Dunstan's church, London, and, dropping the Scottish prefix, became a bookseller and purchaser at "32 Fleet street." He brought out the English Review, and published the elder Disraeli's Conivisions of Literature, etc. He could himself wield the pen, as some pamphlets remain to testify. He died Nov. 16, 1796, and was succeeded in due time by his son John, who was left a minor of 13 at his father's death. One of the earliest hits of John the second was Mrs. Rundell's cookery-book, which proved to be a mine of wealth—more productive, perhaps, than Childe Harold itself. He became connected with Thomas Campbell and sir Walter Scott, and in 1808–9 projected the Quarterly Review, a literary organ, in opposition to the Whig Edinburgh Review, then in the height of its influence. The first number was published Feb. 1, 1809, under the editorship of William Gifford. The new periodical was completely successful, and brought Murray into communication not only with the chief literati, but also with the conserving statesmen of the time. A still more fortunate acquaintance was that with lord Byron, whose Childe Harold was published by Murray in 1812. Murray now removed from Fleet street to Albemarle street, where the business is still carried on. Here Byron and Scott first met, and here Southey made the acquaintance of Crabbe. Almost all the literary magnates of the day were "four o'clock visitors" in Albemarle street. Byron's pleasant verse has described the scene."

"The room's so full of wits and bards, Crabbes, Campbells, Crokers, Freezes and Wards."
Murray.

Murray’s dinner-parties included politicians and statesmen, as well as authors, artists, and dilettanti. Murray paid Byron nearly £20,000 for his works, and his dealings with Crabbe, Moore, Campbell, and Irving were principally. The second John Murray died in his 65th year, in 1843, and was succeeded by his son, John Murray the third. Born in 1808, he was educated first at the charter house, and afterwards at Edinburgh university. The age of Byron had gone by, when, in 1843, he succeeded to the business of his father and grandfather. A more practical and realistic age had succeeded, and the home and colonial library, and Murray’s pride, was the pursuit of the cheap railway and other literature of the present day. A lively and vigorous competition, arising out of the wants of a new era, has somewhat altered the relation of the great publishing houses. That of Albemarle street no longer ranks first in the extent and variety of its transactions, and many of the greatest works in history, biography, travel, art, and science have issued from the Albemarle street press under the regime of the third Murray. Among his later successes may be mentioned Dr. Livingstone’s Travels and Last Journals, Smiles’s Life of George Stephenson, and Charles Darwin’s Origin of Species by Natural Selection. His handbooks of continental travel have lately been supplemented by handbooks of English counties, and these, it is understood, owe much to the personal assistance and superintendence of the present head of the famous house of Murray.

MURRAY, John, 1741-1815; b. Alton, England. At the age of 11 his parents removed to Cork, Ireland. He became a Methodist under the preaching of Wesley and Whitefield. Having read a book by James Relly, a Universalist, he was led to adopt his views. For this he was excommunicated at Whitefield’s tabernacle, London. Persecution for opinion, pecuniary embarrassment, and grief for the loss of his wife, made him very unhappy, and he resolved to seek retirement and relief in America. He preached his first sermon in America Sept. 30, 1770, in a small church, in an obscure place in New Jersey, called “Good Luck.” Believing fully in the doctrine of universal salvation, he gave himself to earnest labor, first in New Jersey and New York, afterwards in Newport, Providence, Boston, Portsmouth, Norwich, and other places in New England. In 1774 he fixed his residence in Gloucester, Mass., where he was represented as a papist, and a secret emissary of lord North in the interest of the English ministry. He was abused, and by a vote ordered to leave the town, but the interference of powerful friends saved him, and he was allowed to remain. In 1775 he was appointed chaplain of a Rhode Island brigade encamped near Boston. The other chaplains petitioned for his removal, but Washington disregarded the petition, and even showed him marked attention. Ill health required him to leave the army, and he returned to Gloucester, where he was settled over a society of Universalists, “Converts to his views multiplied. He was instrumental in the organization of a convention of his sect, which met at Oxford, Mass., Sept. 1785, and took the name of Independent Christian Universalists. In 1787 he visited his native land, and preached in many places with great acceptance and power. Returning before the close of the year, he attended a convention of Universalists held in Philadelphia in 1790. In 1793 he was installed pastor of a society of Universalists in Boston, where he remained the rest of his life. He was buried in the Granary burying-ground, Boston, whence his remains were removed June 8, 1837, to Mount Auburn, where an appropriate monument is erected to his memory. He is regarded as the father of Universalism in America. He published Letters, and Sketches of Sermons, with an autobiography, 3 vols. He is described as possessing a “poetical imagination, a retentive memory, warm affections, and a love for all mankind.” In his public discourses he spoke with “great grace of oratory, a good choice of words, and a great variety of expression.” Except on the one point of universal salvation his views were in harmony with those commonly called evangelical, especially in regard to the proper divinity of Jesus Christ.

MURRAY, Lindley, an English grammarian, was b. at Swatara, Lancaster co., Penn., U. S., in 1746. He was educated at an academy of the Society of Friends, and, on his father’s removal to New York, was placed in a counting-house, from which he escaped to a farm in New Jersey. He then studied law, and was admitted to the bar at the age of 21, and commenced a good practice. During the revolutionary war he engaged in mercantile pursuits with such success as to accumulate a hand-transforme fortune. His health failing, he came to England and purchased the estate of Holdgate, near York, where he devoted himself to literary pursuits. In 1787 he published his Power of Religion on the Mind, which passed through seventeen editions. His Grammar of the English Language was issued in 1795, and was followed by English Exercises, the Key, the English Ruder, Introduction and Sequel, and a Spelling Book. There can be no stronger indication how entirely the systematic study of the English language was—until recent years—neglected by scholars, than the fact that Murray’s grammar was for half a century the standard text-book throughout England and America. Murray wrote an autobiography to the year 1809, which was published after his death, Feb. 15, 1829.

MURRAY, Nicholas, d. b. 1803-61; b. Ireland; trained in childhood by his parents and other relatives in the Roman Catholic faith; acquired the rudiments of education in a village school; in his twelfth year came to New York and obtained employment in the house of Harper & Bros.; 1820 became a member of the Brick Presbyterian church, and, influ-
enced by the advice of his pastor, Dr. Gardner Spring, prepared for and entered Williams' college, graduating there 1826, and at Princeton theological seminary 1829; in 1830 became pastor of the Presbyterian church at Wilkesbarre, Penn., and, in 1833, of the First Presbyterian church of Elizabethtown, N. J., where—declining numerous calls to important cities north, south, east, and west, and two theological professorships—he continued until his death. His personal appearance was attractive and commanding; his winning manners, abundant information, and sparkling wit made him the life of the social circle; his intellect was clear, logical, and comprehensive, and his style simple, rapid, and incisive; his preparations for the pulpit were completely and yet so promptly and systematically made that he often had many sermons waiting their turn to be preached; his pastoral visitations were abundant in the abodes of the poor, the chambers of the sick, and the cheerful homes of his people; his correspondence—literary, advisory, and fraternal—was almost unlimited; with untiring industry he contributed ably and constantly to the weekly press, one series of articles published first in the New York Observer—Kirwan's Letters to Bishop Hughes—have obtained a circulation unequalled in religious literature, and have been translated into French, Spanish, Italian, German, and Tamil. His other published writings in book form are numerous.

MURRAY, William. See Mansfield, Earl of, ante.

MURRAY, William Henry Harrison, b. Conn., 1840; graduated at Yale college in 1862 and from the Yale theological in 1864, when he became pastor of a Congregational church in Greenwich, Conn., where he remained two years. He then removed to West Morien in the same state, whence, after two years more, he was called to the Park street church in Boston. His sermons and lectures began at once to attract general attention, and from 1870 to 1874 he was one of the most popular preachers in Boston. During these years he also delivered several lectures in New England and the west, and published Music Hall Sermons; Camp Life in the Adirondacks; Words Fifty Spoken, and The Perfect Horse. In 1874 he resigned his pastorate of the Park street church, but continued to preach a year or two in Music hall to a congregation which included a part of his former one. In 1876 he established The Golden Rule, a religious weekly newspaper. He afterwards became practically interested in the manufacture of carriages, but soon met with losses and mercantile embarrassment. In 1879-80 he was in England, chiefly in Liverpool, engaged in business. In 1880-81 he visited Texas, took up over the state with a view to colonizing enterprises; and it was his intention to remain for some time.

MURRAY, William Vans, 1762-1803; b. Md.; studied law in the Middle temple, London, and on his return was chosen a member of the Maryland legislature. He was in congress 1791-97, taking a prominent part in the debates. In 1797 he was appointed minister to Holland, and two years later envoy to France, where, in association with Oliver Ellsworth and William R. Davis, he negotiated a treaty with France, between which and this country there had been a long controversy. He resumed his post at Holland, but resigned in 1801. He published a work on the constitution and laws of the United States.

MURRAY, or MORAY, Sir Robert: d. 1673; b. Scotland; entered the French army, in which, by the influence of Richelieu, he obtained the rank of colonel. On his return to Scotland he formed a plan for the escape of Charles I., which came to nothing through the king's irresolution. He is next heard of in 1651, when he was appointed justice-clerk, and soon afterwards he was made a privy councilor and a lord of the session, but he never took his seat upon the bench. He is best known as one of the founders of the Royal Society, which was a continuation of a debating club, which used to meet in London to discuss the "new philosophy," and which obtained a royal charter in 1662.

MURRAY RIVER, the principal river of South Australia. See Austrasia.

MURSHEDABAD, a t. of India, capital of a British district of the same name in Bengal proper, is situated on the left bank of the Bhagrat, a branch of the Ganges, about 124 m. n. of Calcutta. On the opposite side of the river stands Mahinagar, usually reckoned a part of Murshedabad. The town occupies a great space, being several miles both in length and breadth, but the buildings are for the most part of mud. It contains two palaces: the one, old and gloomy; the other, constructed after the European style, and of great beauty, was completed in 1840. Situated on the most frequented route by water from Calcutta to the North-West provinces. The trade of Murshedabad is important. Formerly it was the capital of Bengal, and so wealthy that Clive compared it with London. Pop. (71), 46,192, of whom about 60 per cent are Hindus, and 40 per cent Mohammedans.

MURVIE DRO, a small t. of Spain, in the province of Valencia, and 18 miles n.n.e. of the city of that name, on the left bank of the Palancia, and two miles from its mouth. Pop. about 5,000. It stands on the site of the ancient Saguntum (q.v.).

MURZUK. See Fezzan.

MUSA CE.E, a natural orie of endogenous plants, the largest of herbaceous plants, generally destitute, or almost destitute of true stems, yet resembling trees in appearance, and sometimes rivaling palms in staleness; the long sheathing bases of the leaf-stalks.
combing to form a false stem. The blade of the leaf has many fine parallel veins proceeding from the midrib to the margin. The flowers are congregated on spadices, which are protected by spathe. The fruit is either a 3-valved capsule or fleshy.–The species are not numerous; they are natives of warm climates, in which they are widely distributed, and are of great value to the inhabitants of tropical countries; the fruit of some, particularly of the genus Musa, being much used for food, whilst the fibers of the leaves are employed for cordage and for textile purposes. See Plantain, Banana, and Abaca.

A very interesting plant of the order musaceae is the traveler’s tree (M.) of Madagascar.

**Musaus, Johann Karl August**, a German writer, b. in 1737 at Jena, where he studied theology, was nominated to a country church, but prevented from entering upon the care committed to him in consequence of the opposition of the parsonry of the parish, who refused to receive him on the ground that he had been once seen to dance. In 1763 he received the appointment of tutor to the pages at the ducal court, and in 1770 he became professor at the Weimar gymnasium. His first literary production, which appeared in 1760, was a parody of Richardson’s Sir Charles Grandison, which was at that time extravagantly admired in Germany. The success of this satirical squib was complete; but as literary fame did not bring with it a corresponding amount of pecuniary reward, Musaus was compelled to gain his living by other means than writing; and an interval of more than 18 years elapsed before he found leisure to reappear as an author. In 1778 he published his Physiognomischen Blumen, in which he endeavored, by a good-natured yet striking satire, to counteract the absurd uses to which the Germans of his day had turned Lavater’s system. This, like his previous work, was pre-eminently successful; and, encouraged by the marks of his former favor, which he had gained for his merit, and continued to devote himself to authorship. In 1782 appeared his charming version of German folk-lore, under the title of Volksmärchen der Deutschen, which professed to be merely a collection of popular tales, noted down from the lips of illiterate old country people; but these tales were tinted with such a blending of genial humor, quaint fancy, and strong sense, that they have become a classic work of their kind, popular among persons of every age and class. His satirical sketches, entitled Freund Hein’s Erscheinungen in Holbein’s Meinir (Winterthur, 1785), maintained his reputation as one of the sprightliest and most genial satirists of his country. Under the name of Schellenberg, he began a course of tales, Streuselkörner (Berl. 1787), which, however, he did not live to complete. He died in 1787. His Moralische Kinderkloppen appeared the year after his death, while his other posthumous writings were edited in 1791, with an interesting notice of the author, by his relative and pupil, A. V. Kottzebe. Musaus’s style was at once correct and elegant, adapting itself with singular flexibility to the various subjects which he handled; while the unaffected geniality and frank loving nature which are reflected in all he wrote, have deservedly made him one of the most popular writers of his day in Germany.

**Museu’s**, one of the ancient Greek poets of the mythic period, is said to have been the son of Eumolpus and Selene; according to others, the son and pupil of Orpheus. To him was ascribed the introduction of the Eleusinian and other mysteries into Greece, and the ordering of many religious rites. He was among the ancients also the reputed author of a number of poems, oracles, purificatory verses, a war of the Titans, a theology, hymns, etc.; but of the few verses which remain the authenticity is very doubtful. A later Museus, who probably flourished about the end of the 6th c. of the Christian era, was the author of a very pleasing amatory poem, in Greek, entitled Hero and Leander, discovered in the 13th c., of which the first edition was published by Aldus Manutius about 1494, and of which there have been many subsequent editions.

**Muscadine grape**, a species that grows in the extreme southern states where it is known as the Bullitt grape. The technical term given it by Linnaeus is vitis envelop.

**Muscæ volitantes** is the term applied to ocular spectra, which appear like flies on the wing, or floating black spots before the eyes. There are two kinds of muscæ volitantes—the one a perfectly harmless kind, while the other is symptomatic of one of the most serious diseases of the eyes, viz., amaurosis.

Whoever will look through a minute pin-hole in a card at the clear sky may see floating before his sight a number of translucent tubes or fibers, and many little beads, of which some are separate, some attached to the tubes, and some apparently within them. Some of the tubes or fibers are straight, others looped or twisted, and others again forked. All these objects are bright in the middle, and bounded by fine black lines, beyond and parallel to which may be seen an appearance of colored lines or fringes. The doublings and crossings of the loops or knots in the twisted fibers appear as black points. Though the eye be fixed, these bodies change their position with greater or less rapidity. Now, in ordinary light and vision all these objects are imperceptible, unless the knots or fibers happen to be larger than usual, when they constitute the harmless kind of muscæ volitantes. The black lines and fringes are phenomena of the inflexion or diffraction (q. v.) of light, which are never seen except in divergent rays, and all muscæ volitantes having such fringes must be situated at a greater or less distance from the retina; and there are conclusive reasons for believing that they occupy the vitreous humor, and cannot therefore portend amaurosis; whereas those black spots which have no fringes, and which
do not move, or which move only with the motions of the eye, are points in the retina which are insensible to light, and are therefore to be dreaded as symptomatic of danger to vision. To decide, then, whether the muscae volitantes are or are not indicative of danger, the patient should fix his eye on a white surface (as a sheet of letter paper) after a sudden shake of the head; if they sink gently downwards, they are innocent. It should perhaps be added, that though they seem to descend, they must in reality be ascending, floating up in the vitreous humor as far as the cellular partitions formed by the hyaloid membrane will permit. See Exe. For further information on the differences between the innocent and the dangerous forms of muscae volitantes, the reader is referred to an article by sir David Brewster in the North British Review for Nov., 1856.

MUSCARELINE, or Silk-Worm Rot (Botrytis Bassiana), a fungus (see Botrytis) which grows on silk-worms, and often kills them in great numbers. It consists of erect branching threads, with clusters of spores at the end of short lateral branches. The spores of the fungus are white even on beautiful silk-worms, and in circumstances otherwise most favorable to their healthfulness. They germinate also on the caterpillars of other lepidopterous insects. When this pest appears among silk-worms, its progress cannot be checked by any means known. For prevention, it is most important that the silk-worms be not overcrowded.

MUSCAT, or Maskat, an independent Arab state, forming the sea-cost of Oman, in Eastern Arabia. It extends from the strait ofOrmuz to the island of Musireh, and nowhere exceeds 150 m. in width. The coast and interior are both sterile, but the country is studded with very fertile oases. The capital is Muscat; pop., 60,000, on the Persian gulf, a fortified town, surrounded with gardens and date-palms. It has a very good harbor, which, in the winter months, is reckoned the best refuge in the Indian ocean, and is a most important center of trade, where the productions of Europe, of Africa, and of the east are exchanged. The principal exports are Arabian coffee and pearls obtained from the Persian gulf; but wheat, dates, raisins, salt, sulphur, drugs, and horses are also exported. The independence of Oman dates from 751, when the people elected a sovereign of their own. For 900 years the Imaums were elected for personal merit, and afterwards from members of a ruling family. Muscat was taken by Albuqueque in 1507, and remained in the hands of the Portuguese till 1648, when the Arabs recovered possession of it. The Imaums afterwards made extensive conquests in eastern Africa, including Zanzibar, Mombasa, Quiloa, etc. In 1798 they acquired possession of the coasts of Laristan and Mogistân, the islands of El Kishim and Ormus, and the town of Bender Abbas in Persia, paying to the shah a rent or tribute of 6,000 tomans. The state was very prosperous under the wise and mild sway of Said Seid, the late Imam. He ascended the throne in 1803, at the age of 16, and reigned till his death in 1856. He was long a faithful ally of England. In 1851 the Imaums were driven from their Persian dependencies, in which their opinion belonged to them in perpetuity so long as they paid the rent. They recaptured Bender Abbas, but in consequence of English interference, they were compelled to conclude a treaty with Persia in April 1856. This is said to have broken the heart of the old Seid, who died Oct. 19, 1856. He appointed his son Majid to succeed him in Zanzibar, and his son Thunwany to succeed him in Muscat. The latter was murdered by his son Salim in 1863, who reigned for a short time, but was driven out by his uncle Sayed Tuky. In consequence of the unsettled state of affairs in Muscat, Persia has assumed the government of Bender Abbas and the Persian coast territory. See Zanzibar and Wahabis.—See History of the Imaums and Sovereigns of Oman, by Sahib ibn Razik, from the Arabic, by Rev. G. P. Badger (1781); Markham's History of Persia (1874).

MUSCATEL (Ital. moscadolo, musk), the name given to many kinds of sweet and strong French and Italian wines, whether white or red. Amongst the finest are the white Rivesaltes and red Bagnol wines from Roussillon, and the Lunel from the Pyrenees, the Lavrance Christi and Cariglano of Naples, etc.

MUSCATINE, a co. in s. e. Iowa on the Mississippi river; 440 sq. m.; pop. '80, 23,108—19,192 of American birth. The surface is varied, and the soil fertile. There are rich deposits of coal, and quarries of freestone and limestone. The chief productions are corn, wheat, rye, barley, oats, and wool. The chief articles of manufacture are carriages, metal-ware, boots and shoes, and clothing. There are also saw, flour, and planing-mills, breweries and machine shops. The Burlington, Cedar Rapids, and Northern, and the Chicago, Rock Island, and Pacific railroads pass through it. It is drained by the Cedar river. Co. seat, Muscatine.

MUSCATEEN, a city of Iowa, U.S., is on the w. bank of the Mississippi, 100 m. above Keokuk, and 32 s.e. of Iowa city. It has a large trade by the river, and several railroads, three steam-flour mills, planing-machines, four large saw-mills, which annually produce about 30,000,000 ft. of timber, besides shingles, etc. There are 14 churches, schools, newspapers, etc. Pop. '70, 6,718.

MUSCHELKALK (Ger. shell-lime), the middle member of the triassic, or new red sandstone period, the beds of which are entirely absent from the British strata. Being typically developed in Germany, the foreign name has been universally adopted to designate them. They consist of (1st) a series of compact, grayish, regularly-bedded limestone,
more than 300 ft. thick; and (2d) alternations of limestone, dolomite, marl, gypsum, and rock-salt, nearly 300 ft. thick. The limestone abounds in the remains of mollusca. The paleozoic ganionites are replaced by the ceratites, a remarkable link between them and the secondary ammonites. Ceratites are distinguished by the few small dentilications of the inner lobes of the suture. The heads and stems of lily ceratites (Eucrinus) are also abundant in these strata, and the remains of ganoid fish have also been met with.

**MUSCA.** See Mosses.

**MUSCICAPIDÆ,** a family of birds of the order **Insectivora** and tribe **Dendrocygnta,** of which the greater number receive the popular name fly-catcher (q.v.). The limits of the family are, however, very variously defined by different ornithologists. The Muscicapidae are mostly inhabitants of the warmer parts of the world, in which they are very widely diffused. The species are very numerous.

**MUSCIDÆ,** a family of dipterous insects, having a short, thick, membranous proboscis, gencinated at the base, entirely retractile so as to be concealed within the mouth, and terminated by two large lobes (see House-fly); the antennae three-jointed; the thorax with a transverse suture. The species are very numerous, and universally distributed. More than 800 are found in Britain, among which are the well-known house-fly, blow-fly, etc. The larvae are maggots (q.v.). Although some of the muscide are troublesome, none of them are so much so as species of some other allied families.

**MUSCLE** and **MUSCULAR TISSUE.** Muscular tissue is specially distinguished by its contractile power, and is the instrument by which all the sensible movements of the animal body are performed. When examined under a high magnifying power, the fibers of which it is composed are found to exist under two forms, which can be distinguished from one another by the presence or absence of very close and minute transverse bars or stripes. The fibers of the voluntary muscles—or those whose movements can be influenced by the will—as well as the fibers of the heart, are striped; while those of the involuntary muscles—the muscular structures over which we have no control—as, for example, the muscular fibers of the intestinal canal, the uterus, and the bladder, are unstripped. On examining an ordinary voluntary muscle with the naked eye (a muscle from one of the extremities of any animal, for example), we observe that it presents a fibrous appearance, and that the fibers are arranged with great regularity in the direction in which the muscle is to act or contract (for it is by their inherent power of contracting that muscles act). On closer examination it is found that these fibers are arranged in fasciculi, or bundles of various sizes, inclosed in sheaths of areolar tissue, by which they are at the same time connected with and isolated from the nerves, which, when the muscle is examined with the microscope, it is seen to consist of a number of cylindrical fibers lying in a parallel direction, and closely bound together. These original (or, as some writers term them, the ultimate) fibers present two sets of markings or stripes—viz., a longitudinal and a transverse set. The fibers, when separated from each other, frequently split longitudinally into fibrilles. Sometimes, however, when a fiber is extended, it separates in the direction of the transverse strie into a series of disks. Either cleavage is equally natural, but the latter is the least common. Hence, observes Mr. Bowman, who has specially investigated the minute structure of voluntary muscle, "it is as proper to say that the fiber is a pile of disks as that it is a bundle of fibrilles; but, in fact, it is neither the one nor the other, but a mass in which structure there is an Intimation of the existence of both, and a tendency to cleave in the two directions. If there were a general disintegration along all the lines in both directions, there would be masses of fragments, which may be termed primary particles or sarcomatous elements, the union of which constitutes the mass of the fiber. These elementary particles are arranged and united together in the two directions, and the resulting disks, as well as fibrilles, are equal to one another in size, and contain an equal number of particles. The same particles compose both. To detach an entire fibrille is to extract a particle of every disk, and *vice versa.*" The fibers are supplied with vessels and nerves, which lie in the intervals between them, and are attached by their extremities through the medium of tendon or aponeurosis to the parts which they are intended to move. Aggregated in parallel series, of greater or lesser size, and associated with nerves, vessels, tendinous structures, etc., they form the various muscles which are for the most part solid and elongated, but are sometimes expanded into a membranous shape. The length of the fibers is usually about that of the muscle in which they may occur, and may vary from two feet or more to the (ateriorius muscle) to less than two lines (in the stapedius muscle in the middle ear); while their width varies from 13 to 15 of an inch, being largest in crustaceans, fishes, and reptiles, where their irritability, or property of contracting under the action of a stimulus, is most enduring, and smallest in birds where it is most evanescent. Their average width in man is about 1 of an inch, being about 2 of an inch in the male and 2 of an inch in the female. The average distance between the striae, or the size of the sarcomatous elements, in the human subpect is 0.109 of an inch, the extremes being 0.109 and 0.109 of an inch, according to the contraction or relaxation of the fiber. The form of the fibers is polygonal, their sides being flattened against those of the adjoining fibers. Each fiber is enclosed in a transparent, very delicate, but tough and elastic tubular sheath, which cannot always be readily seen, but is distinctly shown stretching between the separated fragments of a fiber.
which has been broken within it, for its toughness will often resist a force before which its brittle contents give way. This tubular sheath is known as the sarcolemma or myolemma—the former term being derived from the Greek words sarx, flesh, and lemma, a skin or husk; and the latter from the Greek words mys, a muscle, and lemma.

It was for a long time believed that the contraction of a muscle was associated with a change in the direction of each fiber from a straight line to a sinuous or zigzag course. The investigations of Mr. Bowman, have, however, shown that this view is erroneous. He has proved that in a state of contraction there is an approximation of the transverse striæ, and a general shortening with a simultaneous thickening of the fiber, but that it is never thrown out of the straight line, except when it has ceased to contract and its extensor muscles are relied on by the contraction of adjacent fibers.

Muscles grow by an increase, not of the number, but of the bulk of their elementary fibers; and Mr. Bowman believes "that the number of fibers remains through life as it was in the fœtus, and that the spare or muscular build of the individual is determined by the mold in which his body was originally cast."

The structure of the inelastic or unstriped muscles must now be considered. This form of muscular tissue most commonly occurs in the shape of flattened bands of considerable length, but of a width not exceeding \( \frac{7}{10} \)th or \( \frac{9}{10} \)th of an inch. These bands are translucent, and sometimes slightly granular, and are usually marked at intervals by elongated nuclei, which become much more apparent on the addition of acetic acid. Kölliker has shown that every one of these bands or fibers is either a single elongated cell (a fiber-cell) or is a fasciculus of such cells. These fibers have not usually fixed points of attachment like the striated fibres, but form continuous investments around cavities which may be as small as a test-tube, the bladder, the uterus, the blood-vessels, etc.—or are dispersed through the substance of tissues, such as the skin, to which they impart a contractile property.

The chemical composition of ordinary (or voluntary) muscle is described in the article Flesh. It is only necessary to add that the fibrille, or the sarcous elements of which they are composed, consist of a substance termed Syntoneine (q. v.), which closely resembles the fibrine or coagulating constituent of the blood; and that the same syntoneine is also the main constituent of the unstriped muscles, or at all events of their fibre-cells. Like the blood-fibrine, it exists in a fluid form in the living tissue, and only coagulates or solidifies after death.

Our limited space prevents even an allusion to the arrangement and distribution of blood-vessels, nerves, and areolar-tissue in muscular structures; and we therefore pass on to the consideration of the muscles and their functions.

Muscles vary extremely in their form. In the limbs they are usually of considerable length, surrounding the bones and forming an important protection to the joints; while in the trunk, they are flattened and broad, and contribute very essentially to form the walls of the cavities which they inclose. There is unfortunately no definite rule regarding the nomenclature of muscles. Muscles derive their names (1) from their situation—as the temporal, pectorals, glutaeals, etc.; or (2) from their direction—as the rectus, obliquus, etc., of which there may be several pairs—as, for example, rectus femoris, rectus abdominals, rectus capitis, etc.; or (3) from their uses—as the masseter, the various flexors, extensors; or, (4) from their shape—as the deltoid, trapezius, rhomboid, etc.; or (5) from the number of their divisions—as the biceps and triceps; or (6) from their points of attachment—as the sterno-cleido-mastoid, the genio-hygo-glossus, the sterno-thyroid, etc. In the description of a muscle we express its points of attachment by the words origin and insertion; the former being applied to the more fixed point or that towards which the motion is directed, while the latter is applied to the more movable point. The application of these terms is, however, in many cases arbitrary, as many muscles pull equally towards both attachments. Muscles opposed in action are termed antagonists, this antagonism being in most cases required by the necessity that exists for an active moving power in opposite directions. Thus, by one set of muscles, the flexors, the limbs are bent; while by a contrary set, the extensors, they are straightened. One set, termed the muscles of mastication, closes the jaws, while another set opens them; and probably every muscle in the body has its antagonists in one or more other muscles.

The skeleton, which may be termed the locomotive framework, may be regarded as a series of levers, of which the fulcrum is, for the most part, in a joint—viz., at one extremity of a bone—the resistance (or weight) at the further end, and the force (or muscle) in the intermediate portion. In most cases, in order to preserve the necessary form of the body, muscles are applied at a great mechanical disadvantage as regards the exercise of their power; that is to say, a much larger force is employed than would suffice, if differently applied, to overcome the resistance. The two main sources of this disadvantage lie in the obliquity of the insertion, and consequently of the action of most muscles, and in the muscles being usually inserted very near the fulcrum. The first of these disadvantages is in many cases diminished by the enlargements of the bones at the joints. The tendons of the muscles situated above the joint are usually inserted immediately below the bony enlargement, and thus reach the bone that is to be moved in a direction somewhat approaching the perpendicular. If this enlargement did not exist, the contraction of the muscle, instead of causing the lower bone to turn upon the upper one with comparatively little loss of power, would do little more than cause the
two ends of the bones to press upon each other. The second mechanical disadvantage is compensated for by gain in the extent and velocity of movement, and by the avoidance of the great inconvenience of having the muscles extended in straight lines between the ends of jointed continuous levers. Thus the bones of the forearm are bent upon the bone of the arm by the biceps muscle which arises close to the head of the latter, and is inserted at a short distance from the elbow joint, which acts as the fulcrum of the lever. By this arrangement, a contraction of a single inch in the muscle moves the hand, in the same time, through the extent of about twelve inches, but then the hand moves through every inch with only about the twelfth part of the power exerted by the muscle. By the junction of two or more levers in one direction, as in the different segments of the extremities, the extent and velocity of their united actions are communicated to the extreme one. Thus a blow of the fist may be made to include the force of all the muscles engaged in extending the shoulder, elbow, and wrist.

The great and characteristic property of muscular tissue—that of shortening itself in a particular direction when stimulated—is called contractility. The stimulus may be direct irritation by mechanical means, or by galvanism, or by some chemical substance, but in the living body the muscular fibres are, in most cases, made to contract by the immediate influence of the nerves distributed among them, which are consequently termed motor nerves (see Nervous System), and are under the influence of the will. By an exertion of volition, we can contract more or fewer muscles at once, and to any degree, the larger the current and as a matter of fact, there is hardly any ordinary movement performed in which several muscles are not called in play. But every voluntary muscle is also subject to other influences more powerful in their operation than the will. The movement of the features under the impulses of passion and emotion are more or less involuntary, as is shown by the very partial power the will has of restraining them, and the extreme difficulty of imitating them.

Many movements ensue involuntarily when certain impressions, which need not necessarily be attended with consciousness, are made on the surface of the body, or on any part of its interior, either by external or internal causes. Such movements are termed reflex, and are noticed in the article Nervous System. Our space precludes us from noticing the individual groups of muscles in the human body. Several important groups are, however, noticed under Arm, Eye, Foot, Hand, Leg, etc.

MUSCLE SHOALS, an expansion of the Tennessee river in Alabama, about 250 m. from its mouth, where fresh-water muscles are found in great quantities, and a series of rapids make the river un navigable for nearly 25 miles. During that distance, the river falls 100 feet.

MUSCOGEE, a co. in w. Georgia, bounded on the w. by the Chattahooche river, which divides it from Alabama, and on the s.e. by Uptoi creek; 375 sq. m.; pop. 70, 16,663, of which the greater part is colored. It is traversed by the South and Western railroad of Georgia, and North and South railroad of Georgia. A part of the soil is very fertile; a part sandy, and portions of the county are covered with forests. The principal products are cotton and corn. The manufacturing interests are large, principally of cotton and woolen goods. Co. seat, Columbus.

MUSCOGEES-INDIANS. See Creeks.

MUSCovITE, the most common variety of mica (q.v.); synonyms—Muscovy glass, biotial mica, oblique mica, potash mica, common mica, verre de Muscovite. Triclinic crystalization, usually in hen egg or oval forms, with a monoclinic aspect; hexagonal prisms; cleavage parallel to the base, and easily separated, forming very thin, elastic plates, which are used in stones under the name of "isinglass," and in Russia in windows, whence called Muscovy glass. The leaves are sometimes aggregated together in stellate, plumose (plumose mica), or globular forms, or in scales, which are sometimes in masses. Hardness, 2 to 2.5; sp. gr., 2.75 to 2.31 (Dana). Luster, pearly; color, white, gray, pale green, violet-yellow, brown, and dark olive-green, and the colors vary in axial and diametrical directions. In transmission of light it ranges from transparent to translucent. In general terms it is a silicate of potash and alumina, containing iron, and frequently small quantities of manganese, and hydrofluoric acid (see Fluorine, aude). A specimen from Uto, analyzed by Rose, gave: silica, 47.50; alumina, 37.30; peroxide of iron, 3.29; peroxide of manganese, 0.90; potash, 9.60; hydrofluoric acid, 0.50; it contained also 2.63% of water. A specimen from Abborrfoss contained: silica, 39.45; alumina, 9.27; peroxide of iron, 35.75; magnesium, 3.29; persulfur, 5.06; fluorine, 0.29; calcium, 0.32; iron, 1.45; manganese, 2.57 = 90.59 (Swanson). Mica fuses with some difficulty before the mouth of the blow-pipe to a grayish, blebbly mass; easily dissolves in borax and phosphorus salt.
Fine crystals of Muscovite occur in granite at Aeworth, Grafton, and Alstead, N. H., the plates being sometimes 3 ft. across and perfectly transparent. It occurs in Massachusetts at Chesterfield with albite, and in brown, hexagonal crystals at the Middletown, Conn., fieldspar quarry. At Warwick, N. Y., crystals and plates a foot and more in diameter occur in a vein of feldspar. In St. Lawrence co., 8 m. from Potsdam, on the road to Pierpont, it occurs in plates 7 in. across; and near Saratoga in reddish brown crystals with chrysoberyl; on the Croton aqueduct, near Yonkers, in rhombic prisms, with transverse cleavage; in fine, hexagonal crystals of dark brown in Chester co., Penn.; in Philadelphia, smoky brown, with hexagonal internal bands; and at Chestnut hill, near the Wissahickon, is a green variety. It is found in Maryland, at Jones's falls, 2 m. from Baltimore, and various other localities, for which see Dana's Mineralogy.

MUSCOVY. See Russia, ante.

MUSCOVY DUCK. See Musk Duck, ante.

MUSCULAR FORCE, Origin of. Until the year 1866 the universally accepted theory on this subject was that of Liebig. According to him, non-nitrogenous food is consumed entirely in the production of heat; while muscular energy is due to the waste of the non-nitrogenous muscular tissue, and therefore of non-nitrogenous food. Muscular exercise should, if this were the case, cause very distinct increase in the non-nitrogenous excretions of the body, as well as greater elimination of non-nitrogenous substances.

But the experiments of Fick and Wislicenus, made during an ascent of the Fauthorn, led them to deny altogether the increase of excretion of nitrogen, and to come to the conclusion that the energy generated in the muscles is the result of the burning (oxidation) of non-nitrogenous substances (fats and carbo-hydrates), and not of the burning of the albuminous constituents of muscular tissue; and they conclude that the non-nitrogenous constituents of muscles are rather to be regarded as forming the machine in which these substances are burned than as being themselves destroyed. (For a translation of their memoir, see Phil. Mag., June, 1866, supplementary number).

Dr. Frankland (Philosophical Magazine, Sept., 1866) arrives at the conclusion that the non-nitrogenous constituents of the food, such as starch, fat, etc., are the chief sources of the actual energy, which becomes partially transformed into muscular work. He does not, however, deny to the albuminous matters a co-operation in the production of muscular power, but he regards their chief use as being to renew the muscular tissue. The muscles are thus the source both of animal heat and of muscular energy.

Dr. Parkes, in a long and careful series of experiments (see Proceedings of the Royal Society, vols. xvi., page 339; xvi., page 44; xix., page 319; and xx., page 482), examined the effect of exercise, both with a non-nitrogenous and with a nitrogenous diet. He found no marked increase, but only a diminution, of the non-nitrogenous substances exerted during exercise, though subsequently a slight increase took place.

Dr. Pavy, in a series of elaborate experiments recorded in the Lancet (Feb., Mar., Nov., Dec., 1876; Jan., 1877), comes to a similar conclusion. He says: "The theoretical deduction to be drawn from the investigation which has been conducted is that, although the elimination of urinary nitrogen is increased by muscular exercise, yet the increase is nothing nearly sufficient to give countenance to the proposition that the source of the power manifested in muscular action is due to the oxidation of muscular tissue."

The theory of muscular action which Dr. Parkes proposes is as follows: During action the muscles appropriate nitrogen; this act is accompanied by changes in the carbo-hydrates, which lead to the manifestation of mechanical force; these changes lead to effete products (lactic acid, etc.) in the muscles, which, as appears from Rank's experiments, stop their contraction. Then ensues an action of oxygen upon the nitrogenous framework of the muscle, and a removal of the effete products of the carbo-hydrates, so that the muscle becomes again capable of appropriating nitrogen, and of acting.

But, although some such theory as this finds favor with most physiologists, and agrees with most of the experiments on the subject, it is not universally accepted.

Dr. A. Flint of New York made observations on Weston, the American pedestrian, which seemed to show that, in his case at least, the excretion of nitrogen is very distinctly increased, both during and after severe muscular work. He accordingly comes to the conclusion that "the exercise of muscular power immediately involves the destruction of a certain amount of muscular substance, of which the nitrogen excreted is a measure." That is to say, he adheres to the original view of Liebig. His experiments are described in the Journal of Anatomy and Physiology, vol. xi., page 109; and his views are developed in the same journal, vol. xii., page 91, where also numerous references are given to other works and papers on the subject.

It is observed that muscles are credited with a large amount of carbon excreted in the form of carbonic acid which is very largely increased during exercise.

Besides the papers already mentioned, the following may be consulted: Liebig, in Pharmaceutical Journal and Transactions, 1870; Voit, in Zeitschrift für Biologie, 1870; Foster, Text-Book of Physiology, page 323.

MUSES, in the classic mythology, divinities originally included amongst the nymphs, but afterwards regarded as quite distinct from them. To them was ascribed the power of inspiring song, and poets and musicians were therefore regarded as their pupils and favorites. They were first honored among the Thracians, and as Pieria around Olympus.
was the original seat of that people, it came to be considered as the native country of the muses, who were therefore called Plerides. In the earliest period their number was three, though Homer sometimes speaks of a single muse, and once, at least, alludes to nine. This list is the number given by Hesiod in his Theogony, who also mentions their names—Clio (q.v.), Euterpe (q.v.), Thaleia (q.v.), Melpomene (q.v.), Terpsichore (q.v.), Erato, Polyhymnia (q.v.), Urania (q.v.), and Calliope (q.v.). Their origin is differently given, but the most widely spread account represented them as the daughters of Zeus and Mnemosyne. Homer speaks of them as the goddesses of song, and as dwelling on the summit of Olympus. They are also often represented as the companions of Apollo, and as singing while he played upon the lyre at the banquets of the immortals. Various legends ascribed to them victories in musical competitions, particularly over the sirens (q.v.). In the later classic periods, particular provinces were assigned to them in connection with different departments of literature, science, and the fine arts; but the invocations addressed to them appear to have been, as in the case of modern writers, merely formal imitations of the early poets. Their worship among the Romans was a mere imitation of the Greeks, and never became truly national or popular. Among the places sacred to them were the wells of Aganippe and Hippocrene on Mount Helicon, and the Cæstalian spring on Mount Parnassus.

**Museum** (Gr. μουσεῖον), originally the name given by the ancients to a temple of the Muses, and afterwards to a building devoted to science, learning, and the fine arts. The first museum of this kind was the celebrated Alexandrian museum (see Academy). After the revival of learning in Europe, the term museum was sometimes applied to the apartment in which any kind of philosophical apparatus was kept and used; but it has long been almost exclusively appropriated to collections of antiquities and of other things interesting to the scholar and man of science. In this sense it began to be first used in Italy, and probably in the case of the famous Florentine museum, founded by Cosmo de Medici, which soon became a great and most valuable collection of antiquities. Nothing analogous to the museums of modern times existed amongst the ancients, the greatest collections of statues and paintings which were made in the houses of wealthy Romans having been intended for splendor rather than for the promotion of art. The name soon ceased to be limited to collections of antiquities, and sculptures, and paintings; collections illustrative of natural history and other sciences now form a chief part of the treasures of many of the greatest museums, and there are museums devoted to particular branches of science. Of the museums of Britain, the British museum (q.v.) is the greatest; that of Oxford, founded in 1679, is the oldest.—The museum of the Vatican, in Rome, contains immense treasures in sculptures and paintings, and shows books and manuscripts.—The museum of the Louvre in Paris, that of St. Petersburg, and those of Dresden, Vienna, Munich, and Berlin, are amongst the greatest in the world. The usefulness of a museum depends not merely upon the amount of its treasures, but, perhaps, even in a greater degree upon their proper arrangement; and whilst great collections in the chief capitals of the world are of incalculable importance to science, its interests are also likely to be much promoted by those local museums, still unhappily not numerous, which are devoted to the illustration of all that belongs to particular and limited districts. Museums appropriated to the illustration of the industrial arts—their raw material, their machines, and their products—and of everything economically valuable, are of recent origin, but their importance is unquestionably very great. Pre-eminent among institutions of this kind in Britain are the South Kensington museum in London, and the Museum of science and art in Edinburgh.

**MUSGRAVE, Anthony,** b. Antigua, 1828; appointed secretary of Antigua, and afterwards administrator of Nevis. He was lieutenant-governor of St. Vincent 1861–64, when he became governor of Newfoundland, where he remained till 1869, when he was appointed to the same position in British Columbia. He went out to Natal as lieutenant-governor in 1871, was made governor of South Australia in 1873, and is now (1893) governor of Jamaica.

**Musgrave, George Washington, D.D., L.L.D.;** b. Philadelphia, 1804, of north Irish and German descent, studied at the college of New Jersey and Princeton theological seminary, but was prevented by ill health from taking a degree; entered the ministry in 1828: was pastor of the Third Presbyterian church in Baltimore in 1839–52, and of the North Tenth street church in Philadelphia in 1862–68; was corresponding secretary of the Presbyterian board of publication in 1852–53, and of the board of home missions in 1858–61, also in 1876–70. He has been a director of Princeton seminary since 1857, and a trustee of the college of New Jersey since 1859. He is a earnest Presbyterian, a rigid Calvinist, a leader in ecclesiastical affairs, and an able debater.

**Mushroom, or Hygic Agaricus, a genus of fungi of the suborder hygicomycetes, having a hymenium of unequal plates or gills on the lower side of the pileus. The species are very numerous. Many of them are poisonous, many are edible, and some are among the most esteemed foods. The species most esteemed in Britain is the Common Mushroom (A. comestris), a native also of most of the temperate regions both of the northern and of the southern hemisphere, and of which a very large and fine variety occurs in eastern Australia. It is found during summer and autumn but chiefly

U. K. X.—21
Music.

The ridges (excavatus), pileus (umbo) brown, the gills, which in a young state are pink, and afterwards become dark brown. The pileus is attached by its center to the top of the stem. The stem is of a firm fleshy texture, and towards the top is surrounded by a more or less distinct ring, the remains of the curtain veil (indumentum), which in a young state extends to the pileus and covers the gills. The mushroom is gathered for the table when young, being preferred when the veil is still unbroken, and the unexpanded pileus has the form of a ball or button; but both in this state, and afterwards, whilst it shows no symptoms of decay, it is used for making ketchup (q.v.). It has a very pleasant smell and taste, and the flesh, when bruised, assumes a reddish-brown color.—Very similar to it, and often sold instead of it in London and elsewhere, but rejected by all skillful housekeepers as unfit even for making ketchup, is the St. George's Agaric (A. Georgii), sometimes called whiteagar, frequent in moist pastures and near buildings in all parts of Britain. This species is easily distinguished by its larger size—the pileus being sometimes 18 in. broad—its coarser appearance, its rather disagreeable smell, the yellow color which its flesh assumes when bruised, and the lighter color of its gills.—Care must be taken not to confound the common mushroom with the white variety of agaricus phalloides, a species not uncommon in Britain, chiefly in woods and on the borders of woods, which is very poisonous. Perhaps it is the possibility of this mistake which has led to the prohibition of the common musroom in Russia, where many kinds of esculent fungi are brought in great abundance to the market, and where a special officer superintends the sale of them. A. phalloides is, however, easily distinguished by the ring at the bottom of the stem, the white color of the gills, the warts on the upper surface of the pileus, and the powerful smell, which becomes extremely disagreeable as the mushroom grows old.—Another species of mushroom much in use for the table is the Fairies' Ring Mushroom (A. orcaes), sometimes called Scotch bonnet—the Champignon of the French. It is common in pastures in Britain and most parts of Europe, often forming fairy rings (q.v.). It is much smaller than the common mushroom, the pileus being seldom more than an inch broad, the stem taller in proportion. The stem is solid, fibrous, and tough, with no ring; the pileus smooth, fleshy, tough, convex, with a more or less distinct boss (umbo) in the center, of a watery-brown color; the flesh white. The color is strong and agreeable. This mushroom is used for ketchup, and is also dried and powdered for use, as a table salt. It contains addition substances of a stimulating nature. It is constantly brought to market in England. It is liable, however, to be confounded with several poisonous species; but only one of them, A. decalbus, forms fairy rings, and this may be readily distinguished by its disagreeable odor, by its becoming grayish-brown in zones when soaked in water, by the margin of the pileus being at first rolled inwards, and by its very fine dingy whitish gills.—The other edible species of mushroom or agaric are numerous, but they are chiefly used on the continent of Europe, and scarcely at all in Britain, although some of them are common British plants.—The Orange-milked Agaric (A. deliciosus), which grows chiefly in fir-woods and among junipers, has a viscid pileus, 4 in. or more broad, at first orange, afterwards pale, the gills and juice orange, the gills running down the stem, the smell and taste agreeable.—The Mosseuron (A. primulus) is common in woods and pastures, particularly on sandy soils. It has a pileus about 2 to 4 in. broad, convex, yellowish-white when young, the gills at first orange and afterwards whitish. The mushroom is used at first for market, but may be kept on the continent as an article of food.—The Parasol Agaric (A. procerus) is found in pastures, especially under trees. It loves sandy soils. It is remarkable for its long stem, 8 to 12 in. high, with a thick spongy ring. The pileus is 3 to 7 in. broad, at first obusely conic, then bell-shaped, covered with brown scales. The taste and smell are pleasant.—The White Field Agaric (A. virginicus) is one of the most common of British species, growing in pastures, with viscid or satiny white or whitish convex pileus, fully an inch broad, stem nearly 2 in. long, and light chocolate-colored distant gills, which run down the stem. It grows either singly or in groups.—The Anise Mushroom, or Sweet-scented Agaric (A. odor), grows in shady woods and dells among moss and decaying leaves. It has a slightly convex pileus, about 3 in. broad, with pale gills. The odor is like that of anise.—The Ivory Mushroom (A. chernelus) is found in woods, with piles 2 to 3 in. broad, of a grayish-yellow color, broad gills, and a rather long and somewhat more or less pleasant and nutritious. Finer than most of them is the Imperial Mushroom (A. cesurio), the Kaiserling of the Germans, a species found in loamy soils in some parts of Europe, with orange pileus and lighter yellow stem and gills; but, unhappily, it is apt to be confounded with the very poisonous amanita (q.v.) muscaria.

The common mushroom is frequently cultivated both in the open garden and in houses or sheds. To grow it in the open garden, beds are prepared, generally of earth mixed with horse-dung, partly fresh and partly from old hotbeds, and are raised into ridges almost as high as broad. To grow it in houses, boxes are filled with alternate layers of half-rotten horse-dung and of straw, with a surface layer of fine mold. But of each of these methods there are many different modifications, none of which can here
Music.

be detailed. In both, the production of mushrooms is sometimes left to the chance—often almost a certainty—of spawn (mycelium) or spores existing in the dung or earth; sometimes, to increase the probability of a speedy and abundant crop, earth is introduced into the bed or box from a pasture known to be rich in mushrooms, and mushroom spawn is also frequently planted, which is either collected where mushrooms grow, or produced by artificial means, often appearing and being propagated extensively without the development of the mushroom itself. The almost certain production of mushroom spawn in heaps of slightly fermenting horse-dung, straw, and earth, has often been urged as an argument in favor of the equivocal generation of fungi, but the minuteness and multitude of the spores may more reasonably be urged on the opposite side.

Music (Gr. mousike, from μουσική, muse; Lat. musica), a combination or succession of sounds having the property of pitch, so arranged as to please the ear. The pleasure derived from music arises from its exciting agreeable sensations, and raising pleasing mental images and emotions. Apart from words, it expresses passion and sentiment, and linked to words, it loses its vagueness, and becomes a beautiful illustration of language.

The doctrine of musical sounds is based on the principles of acoustics (q.v.). Sound is conveyed through elastic media by waves, not of alternate elevation and depression, but of alternate condensation and rarefaction; in which it is the form, the condition of the groups of particles that progresses, not each individual particle. When a series of vibrations recur on the ear at precisely equal intervals of time, following each other so closely that each cannot be separately distinguished, the result is a musical sound or note. The sound ceases to have a musical character when each pulsation is individually audible, as is the case when there are fewer than about sixteen beats in a second. The gravity or sharpness of the sound is called its pitch, and depends on the number of vibrations in a given time. A succession or progression of musical sounds following each other constitutes melody; the difference in pitch of the same complete sound is called an interval. The arrangement of two or more musical sounds, whose relative pitch is properly proportioned, are heard simultaneously, the result is a chord, and a succession of chords constitutes harmony.

When a vibration is communicated to a string stretched between two points, the result is a musical note, whose pitch is dependent on the length of the string and the degree of tension applied to it: the shorter the string, and the greater the tension, the higher is the pitch. If the string be devided in the middle, the tension remaining the same, the note produced is twice as high in pitch, and is called the octave to the note produced by the whole string. Every vibration of the one corresponds to two of the other, and there is between a note and its octave a far closer relation than between any two other notes; they go together almost as one sound, and are considered to a great extent as one musical sound. In the diatonic scale, familiar to every correct ear, there are six notes, bearing certain harmonic relations to the fundamental note, interposed between it and its octave; and as we ascend, the notes arrange themselves in similar successions of sevens, each set an octave higher, or double the pitch of that which preceded it. The seven notes are designated by the names of the first seven letters of the alphabet, the same letter being used for any note and its octave. For another notation also in use, see Solmization. Taking C for the fundamental note, we have for our scale.

C D E F G A B Ć D E F G A B Ć, etc.

The scale may be extended up or down indefinitely, so long as the sounds obtained continue to be musical. The satisfaction and sense of completeness which the diatonic scale gives the ear, arise from its being founded on correct harmonic principles. The quality called harmony is produced by a coincidence of vibrations; notes are more harmonious the oftener their waves coincide. Besides the octave, two of whose waves coincide with one of the fundamental, there are other intervals harmonious, though in a less degree. Dividing our string into three parts instead of two, we have a note higher than the notes produced by the whole string, by making the longer two-thirds of the original length, and produces a wave of which three coincide with two of the fundamental. Next to the octave, this note stands in the most intimate relation to the fundamental; it is called the dominant. Dividing the string by five, and lowering the note two octaves, another harmonic is got, called the mediant. In contradistinction from both these, the fundamental note (or any of its octaves) is called the tonic or key-note. C being taken as the key-note, E is the mediant, and G the dominant. These three notes, when struck simultaneously, form the harmonic triad, and stand to each other in the relation of 1, 5, 4, (numbers indicating the number of vibrations, which are inversely as the length of the string), or, reducing fractions to integers, in the relation of 4, 5, 6. When a musical string is vibrating, these sounds are heard on close observation more or less distinctly vibrating along with it, the cause being a spontaneous division of the string into aliquot parts, producing subordinate vibrations simultaneously with the principal vibrations. But the dominant may in its turn be the tonic from which another triad of tonic, mediant, and dominant is taken, forming a scale of triads extending indefinitely up and down, and it is from such adjacent triads that the diatonic scale originates. Its elements
are the triad of the tonic united with the triad which stand in the most intimate relation to it—viz., those immediately above and below it—

\[ \text{F A C, C E G, G B D}. \]

F is the note whose dominant is C (the tonic), and therefore, in respect of C, it is called the subdominant. A is the mediant of the subdominant F, and therefore called the submediant. D is the dominant of the dominant, and is called the super-tonic. B, the mediant of the dominant is called the leading note. We have seen that the notes of each triad stand to each other in the relation of 4, 5, 6. Preserving this proportion, and multiplying to avoid fractions, we have

\[ \text{F A C E G B D as } 16, 20, 24, 30, 36, 45, 54. \]

We must multiply F and A by 2, and divide D by 2, to bring them within the compass of an octave, and then we have

\[ \text{C D E F G A B C as } 24, 27, 30, 32, 36, 40, 45, 48. \]

These are the degrees of the diatonic scale, which are indicated by the white keys of the pianoforte, as in the figure represented below.

The interval CD is commonly called a second; CE, a third; CF, a fourth; CG, a fifth; CA, a sixth; and CB, a seventh; CC being, as already seen, an eighth or octave—names corresponding to the position of the notes on the key-board or in the diatonic scale, but having no relation to the proper proportional numbers already given. The intervals of the third, fifth, and sixth (counting from the key-note), owing to the more intimate harmonic relation of the notes between which they lie, afford more satisfaction to the ear than the others, or are, as it is called, the most perfectly consonant intervals. Intervals may be counted from any note as well as the tonic. DF is called a third as well as CE, although these intervals are unequal. We may have intervals beyond the octave; they are, however, substantially but repetitions of those below, CD, a ninth, being also a second, and so on.

It is often desirable in the course of a musical composition to change the key-note, which involves the formation of a diatonic scale on some other note than C, in which case we are said to modulate from one key into another. As the intervals CD, DE, EF, etc., are by no means all equal, the notes which we have already got will not do for a scale founded on any other tonic than C. The ratios of the intervals in the diatonic scale, expressed in numbers by logarithms, are:

\[
\begin{align*}
C &\quad 51 \\
D &\quad 46 \\
E &\quad 28 \\
F &\quad 25 \\
G &\quad 46 \\
A &\quad 51 \\
B &\quad 38 \\
\end{align*}
\]

At first sight it would appear that in keyed instruments there must be a separate row of keys for each tonic, but practically this is found not to be necessary. If D instead of C be taken as key-note, E, G, and A are some approach to the correct second, fourth, and fifth, but F and C are greatly too low in pitch for a proper third and seventh. With some notes taken as key-note, the correspondence is greater, with others it is less. The difficulty is overcome by a system of compromises called temperament (q.v.). Roughly speaking, we have in the diatonic scale an alternation of two long intervals, a short interval, three long intervals, and a short interval. The long intervals 51 and 46 are styled tones, and the short interval 28 a semitone. Were the tones all equal, and the semitone exactly half a tone, a note interposed in the middle of each tone, dividing the seven intervals into twelve, would make it immaterial where the scale began. A system founded on this supposition is the remedy actually adopted in most keyed instruments, and the inaccuracy produced by this compromise is not sufficiently great to offend the ear. The interposed notes, indicated by the black keys of the pianoforte (see fig.), complete what is called the chromatic scale, consisting of twelve intervals approximately equal.

The notes of music are represented in ordinary notation on a series of five parallel lines, called the staff. On these lines, and in the four spaces between them, marks are placed indicating the notes, which are counted upwards, beginning with the lowest line. Every line or space is called a degree, the staff consisting of nine degrees.

When more than nine notes are required, the spaces below and above the staff are used, and the scale is extended by means of short added lines, called leger lines. The pitch of the notes on the scale is determined by a figure called a clef (charte, a key),
placed at the beginning of the staff on a particular note, from which all the others are counted. The clefs most in use are the bass, tenor, and treble clefs, represented on the notes F, C, and G respectively (see Clef). The treble and bass clefs only are used in music for keyed instruments, and when a staff is required for each hand they are joined together by a brace, the upper staff for the right hand, the lower for the left. The ascending scale in these clefs is as follows:

C D E F G A B C D E F G A B C

These notes correspond with the white keys of the pianoforte or the diatonic scale when C is key-note, no allowance being made for the black keys, which, as we have seen, divide the tones into semitones. Those semitones which do not occur with C as key-note are represented by the signs ♭ (sharp) and ♮ (flat). The sign ♭, prefixed to a note, elevates it a semitone in the scale, raising, for example, F to F sharp. ♮ lowers the note by a semitone, depressing B to B flat. When a note which has been elevated by a sharp, or depressed by a flat, is to be restored to its original place, the character ♮ (natural) is prefixed to it. The names of the intervals correspond to the degrees of the staff, but it has been seen that intervals of the same name are not necessarily equal. If the sign of a flat or a sharp be prefixed to either note of an interval, it still preserves its name of a third, a fifth, etc.: but to distinguish intervals of the same degree, the qualifying epithets of major and minor, augmented and diminished, are used.

The different keys in music are best understood by reverting to the scale of triads, on which the diatonic scale is founded. Taking a series of triads, of which the dominant of each is the key-note of the next, we obtain the following scale, extended both upwards and downwards from C:

Each triad is composed of the key-note, its mediant, and dominant, and the scale of each key is composed of the triad of the key-note, with the triad immediately preceding and immediately following it. Each key is succeeded by the key of its dominant, and if we begin with the key of C (in the middle of the scale), each key acquires an additional sharp until we reach the key of F sharp with six sharps. These are the sharp keys. If, beginning again with the key of C, we go back instead of forwards in the scale of triads, we obtain the flat keys; each key has an additional flat to that above it, till we come down to the key of G flat with six flats. This key in instruments with temperament is exactly the same with that of F sharp, and on this account it is not generally found convenient to extend the keys beyond six, or at most seven, sharps or flats. C flat with seven sharps is the same as D flat with five flats, and G flat with seven flats is the same as B flat with five flats. In music written in these keys, double sharps and double flats occur, which are indicated by the characters ♯♯ and ♯♯♯ respectively. In writing music in any key with sharps or flats, it is usual, instead of prefixing the sharp or flat to each note when required, to place the sharps and flats belonging to the key together after the clef, on the degree to which they belong, and such collections of sharps or flats are called the signature.

Signatures of the Sharp Keys.

G D A E B F♯
A sharp or flat introduced in a composition which does not appear in the signature, is prefixed to the note, and called an accidental.

The diatonic scale and keys above described belong to what is called the major mode; there is also another mode in use called the minor mode. In the minor, as in the major mode, the diatonic scale and the keys are based on the scale of triads. Each of the triads already considered consists of two unequal intervals, called a major third and minor third. Supposing we begin with the minor instead of the major third, we have a succession of chords taking their minor third from one triad and their major third from another. These compound chords are called minor triads. Their proportion is as 10, 12, 15, and out of three such consecutive minor triads the scale of the minor mode is constructed.

\[ \begin{align*}
D & F A C E G B \\
80, 96, 120, 144, 180, 216, 270
\end{align*} \]

Multiplying D and F by 2, and dividing B by 2, to bring the whole within the compass of an octave, we have:

\[ \begin{align*}
A & B C D E F G A \\
120, 135, 144, 160, 180, 192, 216, 240
\end{align*} \]

The scale here represented is what is known as the descending scale of the minor mode. When the seventh of the scale ascends to the eighth, it becomes sharp, as the proper leading note or sharp seventh to the tonic. This sharp is, however, always omitted from the signature, and placed accidentally before the seventh which it is to elevate. In order to avoid the harsh interval of the augmented second (from F to G₂), it is usual in the ascending scale to make the sixth sharp also, in order to accommodate the seventh; thus the ascending or accidental scale of the minor mode has two notes altered from the signature.

### Ascending Scale.

### Descending Scale.

Each minor scale is called the relative minor to the major scale on its right hand in the scale of triads, with which it has the same signature: thus the relative minor scale to C major is that of A minor.

\[ \begin{align*}
C & \text{ major} \quad D F A C E G B \\
A & \text{ minor} \quad F A C E G B D
\end{align*} \]

Each minor scale is also called the tonic minor to the major scale on the same key-note, from which it differs in flattening the third of its tonic, and in the descending scale also the third of its subdominant and dominant. The tonic minor scale to C major is C minor.

C Major.

C Minor.

As the descending scale regulates the signature, each tonic minor has three flats more, or three sharps less in its signature than its tonic major.
In this last example, F♯, B♭, and E♯ are all considered sharps in contrast with F♮, B♮, and E♮ of the minor scale.

Rhythm.—In musical notation the relative duration of notes is indicated by their form. Notes may be open or close; they may consist of a head only, or of a head and stem. Where there is a stem, it may be turned up or down, according to convenience.

The semibreve, the longest note in ordinary music, is open, and consists of a head only (\(\text{\textbullet}\)). The minim is an open note with a stem, half the length of a semibreve (\(\text{\textbullet}\)); the crotchet is a close note with a stem, half the length of a minim (\(\text{\textbullet}\)); the quaver is a close note with a stem and hook, half the length of a crotchet (\(\text{\textbullet}\)); a quaver is further divided into two semiquavers with two hooks (\(\text{\textbullet}\)); four demi-semiquavers with three hooks (\(\text{\textbullet}\)); and eight semi-demi-semiquavers with four hooks (\(\text{\textbullet}\)). In slow religious music, an open square note, called a breve (\(\text{\textbullet}\)), sometimes occurs. The semibreve is equivalent in time to two minims, four crotchets, eight quavers, sixteen semiquavers, thirty-two demi-semiquavers, and sixty-four semi-demi-semiquavers. The notes formed with hooks may be grouped together (\(\text{\textbullet}\)). In vocal music this is not done except when a group is to be sung to one syllable. When a dot is placed after a note (\(\text{\textbullet}\)), it is lengthened by one-half; when two dots, (\(\text{\textbullet}\)), it is lengthened by three-fourths.

Every piece of music is divided into portions equal in time, called measures, which are separated from each other by vertical lines called bars. The term bar is often loosely used to denote the measure as well as the line. The exact length of the measure is indicated by a sign at the beginning of the movement. In common time, indicated by the sign (\(\text{\textbullet}\)), each measure includes a semibreve, or its equivalent made up in notes of lower value: (\(\text{\textbullet}\)). All other measures of time have for their denominators two figures placed as a fraction, one over the other. The figures of the denominators are either 2, 4, 8, or 16, which stand for minims, crotchets, quavers, and semifourths, etc., of a semibreve; the numerator indicates the number of these fractional parts of a semibreve contained in each measure. There is another form of common time besides that already noticed, which is called half-time, has a minim or two crotchets in the measure, and is known by the signature (\(\text{\textbullet}\)), i.e., two crotchets—three minims, crotchets, quavers, or semiquavers, grouped in threes. Its signatures are (\(\text{\textbullet}\)) or (\(\text{\textbullet}\)). When there are triple time, its signature being (\(\text{\textbullet}\)) or (\(\text{\textbullet}\)), or quavers in triplets, or quavers in triplets, when the notes are placed as a group in the measure.

When two or four measures of triple time are united in one measure, the movement is said to be in compound common time. Its usual forms are indicated by the signatures (\(\text{\textbullet}\)) and (\(\text{\textbullet}\)). In the first, there are three submeasures of three crotchets; in the second, two submeasures of three quavers. Compound triple time occurs where there are nine notes in a measure, either crotchets, quavers, or semiquavers, grouped in threes. Its signatures are (\(\text{\textbullet}\)) and (\(\text{\textbullet}\)). A variety occasionally occurs in simple or triple time by the measure note being divided into three, or even five or seven, instead of two parts, which are grouped together, sometimes with the figure 3, 5, or 7, placed above them.
Music.

The object of the division of musical passages into measures is to indicate their rhythm, a quality forming an essential element in the pleasure derived from music. Notes of music, like words or syllables, are accented or unaccented. The principal accent is given to the first note of a measure. Of the four measure notes in common time, the third has also a subordinate accent, as has the third measure note in triple time. There are occasions when a strong accent, or emphasis as it is called, is laid on the part of the measure which is usually unaccented; this the composer indicates by the Italian terms *rimarcando*, *sfogato*, abbreviated *rif.*

When in the course of a movement silence is required for a time, this is indicated by a rest or rests corresponding to that time; the breve, semibreve, minim, etc., have each their respective rests, which are represented as follows:

<table>
<thead>
<tr>
<th>Brief —</th>
<th>Semibreve —</th>
<th>Minim —</th>
<th>Crotchet —</th>
<th>Quaver —</th>
<th>Semiquaver —</th>
<th>Demi-semiquaver —</th>
<th>Semidemiquaver —</th>
</tr>
</thead>
</table>

A rest may, like a note, be dotted to indicate the addition of half to its length.

The double bar — — consists of two strong vertical lines, placed at the end of a musical composition, and also at other parts (not necessarily coincident with the end of a measure) where a strain or rhetorical division of a movement terminates. When dotted on one side, all the measures on the side with the dots are to be repeated from the beginning, or from the antecedent double bar.

A tie is an arch placed between two notes on the same degree, to indicate that instead of the two notes written, one note is to be played of the length of both. When the last note of one measure is thus connected with the first of the next measure, the former, though naturally the unaccented note, acquires the emphasis — —

When the same arch is drawn over two or more notes not in the same degree, it is called a slur, and merely indicates that they are to be played smoothly or fluently (legato)

When notes are to be played short, distinct, and detached (*staccato*), a dot is placed over them. A dash implies a greater, and the union of dot and slur a less degree of *staccato* — —

The pause — placed over a note indicates a delay in the time of the movement, and a continuance of the sound made on that part of the measure.

The various degrees of softness and loudness which occur in a piece of music are indicated by the letter *f* for forte, loud; *p* for piano, soft; also *pp* for pianissimo, very soft; *mf* for mezzo forte, rather loud, and *ff* for fortissimo, very loud. A gradual increase of loudness is denoted by the word *crescendo*, or the sign < ; and a diminution from loud to soft by the word *diminuendo*, or the contrary sign >. Many other expressions are used in the body of written music, indicating slowness, quickness, and the character of execution. The most important of them are explained under separate articles—as are the various musical graces or embellishments known under the names of the appoggiatura, beat, shake, and turn. Among abbreviations in frequent use are a line drawn over or under a semibreve, or through the stem of a minim or crotchet, to divide it into quavers; or a double line, to divide it into semiquavers. Two minims may be connected to indicate their repetition as quavers. Thus — —

Harmony.—We have mentioned that when a string is struck, its harmonics are more or less distinctly heard along with it. This arises from the string spontaneously dividing itself into aliquot parts—as one-half, one-third, one-fourth, one-fifth, one-sixth, one-seventh, etc., of the string. The numbers 2, 3, 4, 5, 6, 7, expressing the relative number of
vibrations in a given time, are a measure of the pitch of the note, and placed proportionally to one another, or in the form of a fraction, they are a measure of the interval. The prime numbers 2, 3, 5, and 7, and their compounds, constitute the harmonics of a musical sound: no division by a higher prime number is tolerable to the ear along with the fundamental note, and no sound corresponding to such division is audible in the vibrations of a string—

The degrees of the harmonic scale consist of intervals decreasing in a geometrical ratio from the octave to the minor tone, viz.:

<table>

</table>

Other intervals more or less consonant are to be found in the harmonic scale, of which the most important is 4 : 7, the grave seventh. From this scale is derived the triad, which we have seen to be the foundation of the diatonic scale, and also the whole theory of chords.

The first five notes of the harmonic scale are the component parts of the major common chord, by far the most consonant chord that can be produced by five notes. Neglecting octaves, its essential notes are the major triad, C E G, or 4, 5, 6, which, as already seen, consists of a fifth divided harmonically into major third and minor third. The root on which a chord is formed, or the note by whose division into aliquot parts the notes of the chord are produced, is called its fundamental bass, and the fundamental bass of the triad C E G is C. The common chord is the triad with the addition of the octave of the root; its proportions are 4, 5, 6, 8. Every key contains within itself two other triads besides that of the key-note—viz., those of the subdominant and dominant, which have the subdominant and dominant of the key-note respectively for their fundamental bases; and the feeling of satisfaction produced by the diatonic scale arises out of the fact that its notes belong to a progression of chords formed on a fundamental bass suggested by the ear. This fundamental bass is here indicated on the lower staff—

The relative position of the notes of a chord, and consequently its intervals, may be altered by raising one or more of them an octave; and, on the whole, the nearer the intervals approach to their position in the harmonic scale, the purer is their harmony. Close, in contradistinction to dispersed harmony, is when the notes of a chord are so near that no component note could be placed between them. When the fundamental bass of a chord ceases to be its lowest note, the chord is said to be inverted. Thus and are inversions of the common chord, but not ,

where the fundamental bass is still the lowest note.

The minor triad is, as we have seen, a compound chord, whose ratio is 20, 24, 30, taking its minor third from the triad below, and its major third from the triad above. Its fundamental bass is the key-note. The minor mode has, like the major, three triads in each key—those of the tonic, subdominant, and dominant; and the minor common chord admits of the same inversions as the major, by making the third or fifth the lowest note.

The first seven notes of the harmonic scale contain the chord next in consonance to the common chord, the chord of the seventh or dominant harmony. Rejecting octaves, it is the harmonic triad with the addition of the grave seventh, 4, 5, 6, 7, C E G B, or G B D F, and admits of three inversions, according as the third, fifth, or seventh is taken instead of the root as the lowest note. This chord belongs to the key of which its fundamental note is the dominant; and in order to satisfy the ear, it requires to be followed by a resolution into the common chord of the key, or one of its inversions, the major third rising a semitone to the key-note, and the seventh descending one degree—
The dominant seventh note is flatter by an interval of 63, 64, than the subdominant of the key, though the two are not distinguishable on keyed instruments. The chord of the dominant seventh is the same in the tonic minor as in the major mode, but differs in its resolution, in respect that it descends a tone instead of a semitone.

The dominant harmony affords numerous means of modulating from one key to another. For example, the addition of a dominant seventh to the common chord of a key, effects a modulation into the key of the subdominant. In modulating into the key of the dominant, the supertonic bears the dominant harmony, and becomes dominant of the new key.

For other modulations, we must refer to works on the theory of music.

The following more complex harmonies are also in general use—

1, the chord of the added ninth, consisting of the dominant harmony (its root generally omitted) with the fifth of the adjacent triad above; 2, 3, and 4, the different forms of the added sixth, or chord of the subdominant; 2 is the triad of the subdominant, with the third of the adjacent triad below, or rather its octave; 3 is the triad of the subdominant, minor mode, with the third of the adjacent triad below; and 4, the same triad with the third of the tonic major to the adjacent triad below; 5, the diminished seventh, a compound of the characteristic notes (B F) of the dominant harmony of the major mode with those (G·D) of the relative minor; 6, 7, and 8, the augmented sixths, all dominant harmonies, resolving into the major tonic; 6, called the Italian sixth (F A D⁷), is a compound of the characteristic notes (A D⁷) of the dominant harmony of the minor mode (B D⁷ F A) inverted, with the dominant seventh note (F) of the major triad (C E G) below for a bass; 7, the French sixth (F A B D⁷), the same as the last, with the addition of the octave to the fundamental bass; 8, the German sixth (F A C D⁷), compounded of the characteristic notes of the dominant harmony of the minor mode inverted, with the dominant sevenths of the major triads below and above.

All classical harmonies can be reduced to the chords enumerated, varied by inversions, omissions, suspensions, and pedal basses. A pedal bass or organ point is a bass note sustained through a progression of chords, to only the first and last of which it is the proper bass. The pedal bass of the tonic is often used with the chord of the dominant seventh, the added ninth, and the diminished seventh, and occasionally with other chords; sometimes the pedal harmonies are taken on the dominant instead of the tonic, and the holding note sometimes occupies an upper part instead of the bass—

A musical composition consists of a succession of notes or of chords subject to certain laws. Like discourse, music has its phrases, periods, and punctuation. When a piece of music continues in the same key, it is said to move by progression, a term used in contradistinction to modulation, where the key is changed. Progression in music of two parts is of three kinds—oblique, when one part repeats or holds on the same note, while the other moves up and down; direct, where both parts move in the same way; and
contrary, where one moves up, and the other down. Consecutive chords should in general be connected, either as having some note in common, or as being the chords of closely connected keys. There are certain chords which require a special resolution—i.e., they must be followed by certain other chords; and there are certain progressions which, from harshness, are in ordinary cases to be avoided, more particularly consecutive fifths and consecutive octaves, the latter, however, being admissible when used merely to strengthen a part. Modulation is generally effected by introducing the chords common to both keys, and the secret of good modulation consists in the skilful choice of intermediate chords. Every regular piece of music is composed in a particular key, in which it begins and ends, and which predominates over all the other keys into which it has modulated. The keys into which a key most readily modulates are those most nearly related to it—viz., the dominant, the subdominant, and the relative and tonic major or minor. We have seen how modulation may take place by introducing the dominant harmony of the new key or one of its inversions, and in this way the entire harmonic circle of the keys can be made, either by ascending or descending fifths; but in order to effect this change, it will be necessary, on reaching the key of $G$ with seven sharps, to substitute, by what is called an enharmonic (q.v.) change, $G^b$ with five flats, or vice versa, which on instruments with temperament produces no real change on the pitch, but merely on the names of the notes.

The arrangement of chords which the ear naturally expects at the close of a strain is called a cadence; it corresponds to music to the period which closes a sentence in discourse. It is perfect when the harmony of the dominant precedes the harmony of the key-note, and imperfect when the harmony of the key-note precedes that of the dominant without its seventh.

The imperfect cadence is the most usual termination of a musical phrase, or short succession of measures containing no perfect musical idea. A portion of melody formed of two regular phrases, and containing a perfect musical idea, is called a section, and its regular termination is the perfect cadence.

Music is produced by the human voice, and by a variety of artificial instruments. For the application of the voice to musical purposes, see Singing. Musical instruments are classified as stringed instruments, wind instruments, and instruments of percussion. In some stringed instruments as the pianoforte, the sounds are produced by striking the strings by keys; in others, as the harp and guitar, by drawing them from the position of rest. In a third class, including the violin, viola, violoncello, and double bass, the strings are put into vibration with a bow. In wind instruments the sound is produced by the agitation of an enclosed column of air; some, as the flute, clarionet, oboe, bassoon, flageolet, instruments of wood, and the trumpet, horn, cornet-a-piston, etc., of metal, are played by the breath; in others, as the organ, harmonium, and concertina, the wind is produced by other means. In the two last-named instruments, the sound is produced by the action of wind on free vibrating springs or reeds. Instruments of percussion are such as the drum, kettle-drum, cymbals, etc. The chief peculiarities of the more important musical instruments are noticed in special articles.

Musical compositions are either for the voice, with or without instrumental accompaniment, or for instruments only. Of vocal music, the principal forms may be classed as church music, chamber music, dramatic music, and popular or national music. The first includes plain song, faux-bourdon, the chorale, the anthem, the sacred cantata, the mass and requiem of the Roman Catholic church, and the oratorio. Vocal chamber music includes cantatas, madrigals, and their modern successors, glee, as also recitatives, arias, duets, trios, quartets, choruses, and generally all forms, accompanied or unaccompanied, which are chiefly intended for small circles. Dramatic music comprehends music united with scenic representation in a variety of ways, in the ballet, the melodrama, the vaudeville, and the opera, in which last, music supplies the place of spoken dialogue. Instrumental music may be composed for one or for more instruments. The rondo, the concerto, the sonata, and the fantasia generally belong to the former class; to the latter, symphonies and overtures for an orchestra, and instrumental chamber music, including duets, trios, quartets, and other compositions for several instruments, where each takes the lead in turn, the other parts being accompaniments. These and other forms of composition will be found noticed separately.

History of Music.—A certain sort of music seems to have existed in all countries and at all times. Even instrumental music is of a very early date; representations of musical instruments occur on the Egyptian obelisks and tombs. The music of the Hebrews is supposed to have had a defined rhythm and melody. The Greeks numbered music among the sciences, and studied the mathematical proportions of sounds. Their music,
However, was but poetry sung, a sort of musical recitation or intoning, in which the melodic part was a mere accessory. The Romans borrowed their music from the Etruscans and Greeks, and had both stringed instruments and wind instruments.

The music of modern Europe is a new art, with which nothing analogous seems to have existed among the nations of antiquity. The early music of the Christian church was probably in part of Greek, and in part of Hebrew origin. The chorale was at first sung in octaves and unisons. St. Ambrose and Gregory the great directed their attention to its improvement, and under them some sort of harmony or counterpoint seems to have found its way into the service of the church. Further advances were made by Guido of Arezzo, to whom notation by lines and spaces is due, but the ecclesiastical music had an uncertain tonality and an uncertain rhythm. Franco of Cologne, in the 13th c., first indicated the duration of notes by diversity of form. The invention of the organ, and its use in accompanying the chorale, had a large share in the development of harmony. Along with the music of the church, and independently of it, a secular music was making gradual advances, guided more by the ear than by science; it seems to have had a more decided rhythm, though not indicated as yet by bars. The airs which have become national in different countries were developments of it, but it had its chief seat in Bellic Gaul; and the reconciliation of musical science with musical art began in Flanders by Joquin Duprè in the 15th c., was completed in the 17th c. by Palestrina and his school at Rome, and reected eventually on the ecclesiastical style. The opera, which appeared nearly contemporaneously with the Reformation and revival of letters, greatly enlarged the domain of music. Italy advanced in melody, and Germany in harmony. Instrumental music occupied a more and more prominent place. Corelli's compositions excited the violin. Lulli and Ramecan, with their ballet-like music, seized the characteristics of French taste, till the German Gluck drove them out of the field. The scientific and majestic fuge reached its highest perfection under J. S. Bach. The changes introduced in ecclesiastical music in England at the restoration gave birth to the school of Purcell; and a little later England adopted the German Handel, who was the precursor of Haydn, Mozart, Beethoven, Spohr, and Mendelssohn. The principal fact in recent musical history is the movement with which the name of Wagner is connected, having for its aim the production and perfection of a true musical drama, in which, unlike the opera, the words and music shall be of equal importance.

MUSIC (note). The history of music in the United States had its origin in the quaint and primitive psalm-singing of the Puritans, and until 1825, when Italian opera was first given in this country, church music was cultivated to the exclusion of all other styles. It appears that Ainsworth's version of the Psalms was brought over by the Pilgrim Fathers who landed on Plymouth rock; and remained in use till 1693, when the Bay Psalm-Book was generally adopted. This latter version was printed in 1640 in Cambridge, Mass., with the title The New English Version of the Bay Psalm-Book, and was the first important publication of its kind in America. Although it had been compiled by an association of New England ministers, and approved by the churches, it met with great opposition. Many congregations looked upon the old version and its psalms as the inheritance of their forefathers. Among other scruples of conscience were, whether the singing of the Psalms of David with a lively voice was proper in these New Testament days. This and other quibbles set the churches into a turmoil, which did not subside until the rev. John Cotton wrote a tract in answer to the objections, which was sent to all the churches, Nathaniel D. Gould states in his book on Church Music in America that "when this tract or circular was read, and their feelings were reconciled, other objections and queries arose, namely, whether it was proper for one to sing, and all the rest to join only in spirit, and saying amen, or for the whole congregation to sing. Whether women as well as men, or men alone, should sing; whether psalms (the unconverted), be permitted to sing with us, or church members alone. Also, whether it be lawful to sing psalms in meter devised by man, and whether it be lawful to read the psalm to be sung, and whether proper to learn new tunes which were uninspired; for it appears that they had so long been accustomed to hear and sing the same few tunes that they had nibbled the idea that the tunes were inspired, and that now's melody was only a vain show of art." Previous to the year 1690 there were but eight or ten psalm-tunes, taken mostly from Ravenscroft's collection, and they were sung in rotation, without any regard to the subject of the preacher. About 1712 rev. John Tufts of Newbury published a book of twenty-eight tunes, with rules "that the tunes might be learned with the greatest ease and speed imaginable." When it was made known that some had acquired the art of learning a tune by note, without having heard it sung, "all were amazed, and still more astonished that all could finish a tune together." Rev. Thomas Walter of Roxbury, Mass., in 1721, edited the first book of music (except the few tunes attached to the Bay Psalm-Book), with the art of singing by note, with bars to divide the notes or measures, for the first time. The rev. Mr. Barnard of Marblehead published the psalms and hymns in verse, with fifty tunes at the end of the book. His work contained such tunes as Mear, Windsor, etc., in three parts, with one page of instructions. James Lyon of Philadel-
phia, in 1761, published a choice collection of psalm-tunes, hymns, and anthems, in two, three, and four parts, called Urania. Josiah Flagg of Boston, in 1764, published a collection of church-music, engraved by Paul Revere, containing 116 tunes, generally of rather a light character. In 1770, appeared in Boston, The New England Psalm-Singer, or American Chorister, containing a number of psalm-tunes, anthems, and canons, composed by William Billings, a native of New England. This book opened a new era in American church music. William Billings was the author of six books of music, which were nearly all original, and very popular in their day. He was a zealous patriot, and the words to which he set many tunes combined religion and patriotism. These melodies were sung in the tent by the soldiers as well as in the church, and in many a camp, to the spirit of liberty among the people.

Among those who succeeded Billings in composing and compiling church-music were Andrew Law, Oliver Holden, Samuel Holyoke, Daniel Reed, William Little, Timothy Swan, George Lucas, Thomas Hastings, Lowell Mason, George James Webb, N. Gould, Henry E. Moore, William B. Bradford, E. Ives, B. F. Baker, H. W. Groatere, George Kingsley, L. O. Emerson, Charles Zeuner, H. K. Oliver, John Zundel, Albert W. Berg, Henry Stephen Cutler, William H. Walter, Henry Wilson, William A. King, D. F. Hodges, Richard Storrs Willis, S. P. Tuckerman, H. N. Johnson, H. C. Tiffin, A. F. Lejial, L. H. Southard, J. H. Wilcox, Joseph Mosenthal, John P. Morgan, A. Kreisemann, Dudley Buck, and many others. Of these, Thomas Hastings and Lowell Mason deserve special mention for their life-long exertion to spread musical knowledge. The books of the two last-named gentlemen are the most popular collections of church-music which have been published in America. The flow of songs to the name of Billings, and the spirit of liberty and patriotism, and the religious exercise of the people. Hastings published in 1822 A Dissertation on Musical Taste, which was widely read, and did much toward the improvement of musical culture. Under the influence of Lowell Mason vocal music received an extraordinary impulse in Boston, and throughout New England. Eminent teachers were introduced into the schools; the Boston Academy of Music was established; and music was prescribed as a regular branch of instruction in the schools of Boston, and subsequently throughout the entire country. His published works, particularly the Carmina Sacra, were very popular, and are still in circulation. Hastings and Mason were followed by many imitators who made numerous compilations of hymn-books, Sunday-school melodies, glee-books, etc., which were constantly issued, as they proved for many years the most profitable kind of musical publications. In connection with the subject of church-music the Gospel Hymns of P. P. Bliss and Ira D. Sankey should not be forgotten. They were introduced at the time of the Moody & Sankey revivals of 1875 and subsequent years, and were published in a cheap edition, which was sold by the million. Among the most popular were: "Hold the Fort," "Almost Persuaded," "Purl For The Shore," "What Shall The Harvest Boy" by P. P. Bliss; the "Ninety and Nine," by Ira D. Sankey; "I Need Thee Every Hour," by Robert Lowry; "What a Friend We Have In Jesus," by Charles C. Converse; and the "Sweet Bye-and-Bye," the words of which were written by S. Fillmore Bennett and the music composed by Joseph P. Webber some years before the Gospel Hymns were published. These hymns have been severely criticised for catering to an inferior order of musical taste; but they satisfied the popular craving for pleasing melodies, and were of unquestionable benefit to a certain class of people who afterward were led to the cultivation of higher styles of church-music.

There is now (1881) a movement in New York to have the scholars of the various Sunday-schools who are musically inclined, meet in some large hall in their section of the city, and give a concert for the purpose of raising money to defray the cost of instruction. They will be taught to read notes at sight, and be made familiar with a better class of sacred music. Sigismund Lasur has recently compiled a Congregational hymnal, with selections of the highest class, aiming at the improvement of public taste.

Many societies were founded at the beginning of this century for the cultivation of oratorios in cities like Boston, New York, Philadelphia, Baltimore, and Albany. Of these, the Boston Händel and Haydn society became the most prominent, and is to-day by many considered the leading organization of its kind in America. Between 1820-40 there were a number of oratorio societies in New York, such as the New York Sacred Musical Society; Enterpeon, etc., which produced The Messiah; The Creation; Mozart's requiem-masses, and the masterpieces of Haydn and Beethoven. At the present time nearly every large city of the United States has a similar organization; but opera has made a permanent home in one place. The first representation of Italian opera was given in New York in 1825, and the troupe included Garcia, and his daughter Malibiran. Since then Ullmann, Mareterck, Strakosch, Carl Rosa, Mapleson, and other managers have brought over European artists to give a season of opera in New York and all the large cities. Among singers who have been heard in this country are: M. W. Balfé (1834); John Braham (1840); Jenny Lind (1850); Teresa Parodi (1850); Catherine Hayes (1851); Henrietta Sontag (1852); Marietta Alboni (1852); Grisi and Mario (1854); Adelaide Phillips (1855); Brignoli (1855); Henrietta Eben (1856); Carl Formes (1857); Roberta Colson (1858); Anna Bishop (1858); Adelina Patti (1859); Carlotta Patti (1861); and Aurea Rosa (1866). Of operatic singers who have visited America in later years are: Christine Nilsson (1871); Pauline Lucca (1872); Campanini (1873); Capouil (1873); Irma de Murska (1875); Tamburlick (1875); Maurel (1875); Emma Albani (1874); Teresa Tiunis (1875); Wachtel (1875); Anna de Beloeca (1876); Minnie Hauck (1876); Maie Pappoulidion (1877); and Etidca Gerster (1877). Of American opera-singers, Clara Louise
Kellogg and Annie Louise Cary have achieved considerable reputation; and Emma Albani and Minnie Hanck, though classed by some as foreign singers, were born in this country. English opera was given in this country as early as 1738, when an English troupe performed in Washington and Philadelphia. In 1816 the Phillips company came over, and in 1820 Davis established an opera company in New Orleans. In 1824 Mrs. Hood brought a company to New York. In 1832 came the Wood and Dunam's company. The Seguins came in 1838, and after them the Pyne and Harrison troupe, Madam Bishop, and the Richings opera-troupe. Since then many other companies have been formed; but none have done more for the artistic success of English opera than Clara Louise Kellogg. Among the numerous pianists who have performed in America are: Sigismond Thalberg (1807); Anton Rubinstein (1829); Hans von Bulow (1856); Annette Essipoff (1876); and Rafael Josephy (1879). It would be difficult to quote the number of excellent American pianists: Louis Moreau Gottschalk, who was born in New Orleans in 1829, and played somewhat in the style of Chopin, was very much admired; and S. B. Mills is ranked as an excellent artist. There have also been a great number of violinists who have played in America—Henry Vieutemps (1843); Ole Bull (1844); Camillo Sivori (1846); Camilla Urso (1852); Heinrich Wieniawski (1872); Remenyi (1878); August Wilhelm (1878); Carl Bergmann, Theodore Thomas, Dr. Leopold Damrosch, Harvey B. Dodworth, and P. S. Gilmore have won distinction as musical conductors. Theodore Thomas established symphony concerts in New York, and finally organized his orchestra which has made him famous in this country and in Europe. The New York philharmonic society, under his leadership, introduces the highest class of music. Among composers who have made a reputation are: Karl Anschütz, George Bristow, F. L. Ritter, Dudley Buck, S. P. Warren, U. C. Hill, Henry C. Watson, A. Bagioli, J. Eichberg, Joseph Mosenthal, Nathan Richardson, Carlo Bassini, Richard Hofmann, S. B. Mills, G. W. Morgan, W. B. Berg, H. H. Wollenhaupt, and many others. Although America has not produced a single genius like Beethoven, Chopin, or Verdi, there is one line of composition that has been cultivated with great success, disproving the statement that we are indebted to the foreign element of our population for the music we possess, for the songs that have become the most popular and are endeared to the hearts of our people were composed by Americans. Stephen C. Foster acquired the reputation of being the first songwriter of melodies of everyday life and melody. The best-known of his songs is "Old Folks at Home," in which he hoped to rival "Home, Sweet Home," that has become the home-song of the world, and was written by an American author—John Howard Payne. Foster composed many songs which attained great popularity, such as "Massa's in de Cold, Cold Ground;" "Old Dog Tray;" "Willie, We Have Missed You;" "Ellen Bayne;" "Oh, Susanna!" and "Uncle Ned." All his songs had great pathos and freshness; but "Come Where My Love Lies Dreaming" was his most artistic composition. L. O. Emerson composed "We Are Coming, Father Abraham;" "Out In The Cold." Among his popular sacred songs are: "Stand Up For Jesus;" "Jesus Loves Me;" and his tunes to "Rock of Ages," and "Guide Me, O Thou Great Jehovah," are favorites. George F. Root is the author of the "Battle Cry of Freedom," "Tramp, Tramp, Tramp;" "Hazel Dell;" and "There's Music In The Air." Charles G. Bullard composed "Viva l'America," and "American Folk Songs of the Nineteenth Century." "Under the Daisies," "When the Tide Comes In;" and "Don't Be Sorrowful, Darling." Henry C. Work composed the war songs "Marching through Georgia;" "Kingdom Coming;" "Wake, Nico demus;" "Grafted into the Army;" "Babylon is Fallen;" and "Song of a Thousand Years." He also wrote "Come Home, Father," a temperance song, and "My Grandfather's Clock," which, although of inferior merit, have become very popular. H. P. Danks has composed a large number of songs, of which "Silver Threads among the Gold" is the best known. Septimus Winner, whose nom de plume is Alice Hawthorne, wrote "What is Home without a Mother?" "Listen to the Mocking-Bird;" "I've Sailed the Seas Over;" or the Song of Enoch Arden," and many others. J. R. Thomas wrote "The Cottage by the Sea;" "Happy be thy Dreams;" "Some One to Love;" and "Tis but a little Faded Flower." Mathias Keller, composer of the "American Hymn," wrote "Mother, Oh Sing me to Rest," and Thine Image," which were very popular in their day. There are in a recent magazine article on the "Musical Possibilities of America," states: "There are in America certain music-loving people. At present the musical standard of the American public, taken as a whole, must be pronounced a low one, though we rightly claim for this country a high rank in cultivation. The greater part of the church-music is a sort of patch-work—a little piece from this composer, and another piece from that—put together by an amateur. This low standard of church-music is not owing to the want of competent organists, for we have many of ability; but rather to the fact that they are hampered in their attempts to introduce better music. Recent years have also given us composers of undoubted merit. It is generally acknowledged that we make the best pianos. Our organs are good, and our brass and reed instruments are of a superior quality. But the most noteworthy fact of all is that we are making the best violins. Some of the first living violinists claim that the violins made by George Gemflnder are worthy to rank with those of the famous Italian makers, needing only age to prove their great excellence. It will be seen that we have in this country the
possibilities of a great musical future. We have the musical taste of the people for music, their strong desire to have the best, and their readiness to recognize what is best when it is presented to them. We have exceptional natural resources for the making of musical instruments. Nature has done her part of the work generously; it remains for us to do ours.

MUSICAL BOX, a case containing mechanism constructed in such a manner that music can be produced automatically. Machines for making mechanical music have been known since the invention of clocks; but real musical boxes were not introduced till after 1750. They have been greatly improved since then, and some of our modern musical-boxes can play over 100 tunes. The mechanism is similar to that of the barrel-organ. The principal parts are the comb, the cylinder, and the regulator. Bells, drums, and castanets are frequently added to produce musical effects, and in such cases the boxes are sometimes termed mandolins, expressive, quiautos, organoidees, piccolo, etc. When they have a combination of reeds and pipes they are known as flutes, celestial voices, and harmoniphones. Large quantities are exported annually of the musical clocks made in the Black Forest and the musical boxes of Prague, and Sainte Susanne in France. The best musical boxes, however, are manufactured at Geneva, Switzerland.

MUSIC RECORDER. Many forms of apparatus have been invented for writing down music in a legible form by the very act of playing it on a keyed instrument, such as the pianoforte or organ. Beginning with 1747, various attempts had been made practically to effect this object, when, in 1863, Mr. Fenby invented and patented his phonograph (quite distinct from Bell's phonograph, q.v.), in which he brought in the aid of electromagnetism. His chief aim, as an improvement on previous apparatus, was to devise a method of denoting the length of the notes, as well as their pitch and the interval between them. On pressing down any key of the instrument, a stud on the under side touches a spring; the spring sets in action a small electro-magnetic apparatus, which causes a tracer to pass against a strip of paper moving onward at a uniform rate by means of a cylinder and clockwork. The paper is chemically prepared, so as to receive a brown stain whenever the tracer passes along its surface. The length of each note is expressed by horizontal dashes of greater or less length, made by the tracer; and the arrangement is such as to denote the lines of the stave as well as the character of the note. By subsidiary adjustments the apparatus is made to express accidental sharps and flats, changes of time, etc.

The abbé Mogno's phonograph, introduced to the British association in 1860, is a contrivance—not for noting down sounds in any kind of musical notation—but for causing a vibrating surface to tell its number and character of vibrations. A kind of spherical drum is covered at one end with a diaphragm or stretched membrane; a sheet of paper is carried along this drum-head by means of clockwork; and a system of small levers moves a pen. A tuning-fork, an organ-pipe, or the voice is sounded in proximity to the drum, the body of air within which acts as a re-enforcement of the sound; the membrane vibrates in a manner which can be felt by the pen, although not seen by the eye; and the pen makes zigzag markings on the paper. When the sound is produced by a tuning-fork or an organ-pipe, the zigzag lines are so regular that they serve to denote the number of vibrations belonging to each particular note. When the sound is that of a singing voice, the markings become very peculiar, especially in words containing the gutturals r, g, etc. For the more recent Phonograph, see under that head.

MUSK, or MUSK DEER, Moschus moschatus, a luminous quadruped, the type of the family moschidae. This family differs from cervidae (deer) in the want of horns, and in the long canines of the males, projecting beyond the lips. The musk is an inhabitant of the elevated mountainous regions and table-lands of central Asia. The habits of the musk are very similar to those of the chamois. Its favorite haunts are the tops of pine-covered mountains, but its summer range extends far above the region of pines. Its habits are nocturnal and solitary, and it is extremely timid. It is much pursued by hunters on account of its odoriferous secretion, which has been known in Europe since the 8th c., and is much valued as a perfume. This secretion, musk, is produced in a glandular pouch situated in the hinder part of the abdomen of the males; and its natural use seems to be that of increasing sexual attractiveness. The musk-bag is formed by an infolding of skin and muscles of the skin of the belly, within which a number of membranes are contained, and between these membranes are glands by which the musk is secreted. When newly taken from the animal, musk is soft and almost resembles an ointment; it is reddish-brown, and has an excessively powerful odor. Very little of it reaches Europe undulterated.—Musk is usually imported either in the form of grain-musk, that is, the musk which has been collected chiefly from stones upon which it has been deposited by the animal, in which state it is a coarse powder of a dark-brown color; or in the pod, that is, in the musk-sack, which is cut altogether from the animal, and dried with the musk inside. Of both kinds the annual importations are about 15,000 ounces per annum, chiefly from China and India. Small quantities are used in medicine, but the greater portion is employed by the perfumers. It is imported in small boxes or catties, often covered with bright-colored silk, and each containing 25 pods. The kinds generally known in trade are the Tonquin or Chinese, which is worth two guineas an oz. in the pod, or £3
10s. per oz. in grain; and the Carbadine, Kabardine, or Siberian, which is always imported in pod, and is very inferior, being only worth about 15s. an ounce.

The flesh of the musk is sometimes eaten, but has a very strong flavor. The season of migration from the highest and coldest to more temperate regions, is that at which the musk is chiefly pursued. — No other animal of the family moschidae yields the perfume called musk, or has more than a rudimentary musk-bag. The other species of moschidae belong to the genus tragulus, and receive the popular name chevrotain. They have a very elongated muzzle; and the accessory hoofs assume the form of appressed conical claws. They inhabit the thick woody copses or jungles of the Indian islands, and are the smallest of ruminant quadrupeds. Some of them are not larger than a hare. Their tasks are not so long as those of the musk. One of them, the nilgai of Java and Sumatra, has the smallest blood corpesoles of any known animal.

MUSKALONGE, or MUSKALLUNGE, the ecor color of the esocide or Pike family. It inhabits the North American lakes and the St. Lawrence river. Its length is sometimes 50 inches, often weighing 60 pounds. They are caught, either with hook or net, ranging from a few pounds up to this excessive weight. See Pike, aile.

MUSK DUCK, Cairina moschata, a species of duck, of the non-oreanic section of anatidae (see Duck); of a genus characterized by an elevated tubercle at the base of the bill, the edges of the mandibles situated, the face and lores covered with a bare tuberculated skin, the wings furnished with a knob or spur at the bend. The musk duck, or Muscovy Duck—so called, however, through mistake, and receiving its name musk duck more appropriately from its musky smell—is a native of the warm parts of America. It is very plentiful in Guiana, in that part of the year when winter reigns in the north. It is a larger bird than the common duck, in its wild state almost black, with glosses of blue and green, and white wing-coverts, but varies considerably in domestication. It is often to be seen in poultry yards in Britain, but is rather curious than profitable. It hybridizes readily with the common duck, but the hybrid is sterile. — The musk duck of Australia is a very different species, belonging to the genus cucura.

MUSKEGON, a co. in s.w. Michigan, along the shores of Lake Michigan; 500 sq.m.; pop. 80, 26,596—17,391 of American birth. It is mostly rolling and fertile prairie, watered by the Muskegon and White rivers, and a number of smaller streams. The principal productions are corn, wheat, and oats, which are grown in nearly equal quantities. It contains a large number of saw-mills, besides carriage shops, metal-ware manufactories, machine shops, sash and blind manufactories, tanneries, and curriers' shops. It is on the line of the Chicago and West Michigan, and the Michigan Lake Shore railroads. Co. sent, Muskegon.

MUSKEGON, a city in Muskegon co., Mich., on the Muskegon river, near lake Michigan; pop. 70, 8,505. It is on the line of the Lake Shore, the Grand River Valley, and the Muskegon and Big Rapids railroads, and has daily steam communication with Chicago. The preparation and shipment of lumber is the principal business. The transportation of the lumber employs a large number of vessels, and much is sent by rail. The logs float down the Muskegon river into lake Muskegon, which has an area of some 10 sq. miles. More than 300,000,000 ft. of lumber are annually shipped, and there are between 30 and 40 saw-mills. There are also saw manufactories, foundries, and sash and blind factories.  

MUSKET, or Mousquet (Fr. mousquet; from mouquet, a sparrow-hawk; in the same way that other shooting-implements were named faulcon, faulcnet, etc.), the fire-arm for infantry soldiers, which succeeded the clumsy arquebus, and in 1851 gave way before the Enfield rifle, which, in its turn, was converted into Snider's patent breech-loading rifle, now known as the Snider-Enfield; the latter arm, so far as the regular infantry is concerned, has been replaced by the Martini-Henry breech-loader, but the navy, cavalry, and auxiliary forces still retain the Snider. The first muskets were matchlocks; after which came wheel-locks, asumphans or snap-bance and flint muskets; and lastly, percussion muskets, which were a vast improvement, both for accuracy and lightness, on all which had gone before. Compared, however, to either the Enfield or Martini-Henry rifle, the musket familiarly known as Brown Bess (possibly a corruption of Ger. buecke, a hollow tube or gun) was a heavy, ugly, and ineffectual weapon. The following is a table of the ranges attained, on an average, by the musket, the Enfield, and the Martini-Henry:

<table>

MUSKEETON, an obsolete weapon, was a short musket of very wide bore, carrying a ball of 5 oz., and sometimes bell-mouthed like a blunderbuss.

MUSKETRY, Scemptoms. When the introduction of the Minié rifle in the French service, and the subsequent arming of the British troops with the still more delicate Enfield rifle in 1851, brought the accuracy of a soldier's fire to be an important consid-
eration in estimating his value (which with the old musket was not the case, as it was proverbial that the bullet never hit the point aimed at, however carefully), the English government at once saw the necessity of providing instruction in the manipulation of the rifle. Accordingly, instructors of musketry were attached to the troops, one to each regiment; and a school was established at Hythe in 1854, under the late gen. (then col.) Hay, where lessons on the theory of the arm, and practice in its actual employment, were the sole occupation of the day. Officers and promising men were sent there as fast as the accommodation permitted; and after a course of a few weeks were able to return to their corps, and become instructors to their comrades, so that the shooting of the whole army soon rose in a surprising degree. Whereas, before the establishment of this school, the English stood low in the scale of shooting, the competitions held during recent years at Wimbledon have demonstrated that no nation can now excel them as marksmen. The formation of the volunteer corps, in 1859, led to a greatly increased demand for musketry instruction, which the government met by forming a second school of musketry at Fleetwood (now abandoned), where the troops and volunteers of Scotland, Ireland, and the northern English counties found the necessary teaching. The Hythe school is superintended by a commandant and inspector-general of musketry instruction, with subordinate instructors. The inspector-general is responsible also for the instruction throughout the regiments all over the world, and to him the musketry returns from each regiment are sent annually.

MUSKINGUM, a co. in s.e. central Ohio; drained by the Licking and Muskingum rivers and several creeks; intersected by the Baltimore and Ohio, the Pittsburg, Cincinnati, and the Muskingum Valley railroads; about 700 sq. m.; pop. 80, 49,780—46,582 of American birth. The surface is undulating, and the soil fertile; there are forests of valuable woodland; wheat, Indian corn, hay, and dairy products are the staples; copper, lead, iron, and limestone are found. The Ohio canal passes through the county; and there are numerous brickworks, carriages, sledges and harness, woolen and cotton goods, etc. Co. seat, Zanesville.

MUSKINGUM RIVER, flowing s.e. through Ohio, and emptying into the Ohio river; formed by the junction of the Tuscarawas and Walhonding rivers. The entire length from Coshocton to Marietta is 115 m., and the stream passes through Muskingum, Morgan, and Washington counties, and is navigable as far as Dresden. The river furnishes water-power for many factories at Zanesville and Marietta and elsewhere.

MUSKOKA, an electoral district in Ontario, Canada; 5,300 sq. m.; pop. '70, 6,919. Capital, Bracebridge.

MUSK OX, Bos moschatus, or Osilos moschatus, an animal of the family bovidæ, regarded as a connecting-link between oxen and sheep. It inhabits the most northern parts of America, enduring the winter even of Melville island and Banks' land; but, like many other animals, it is partially migratory, some individuals or hinds seeking more southern regions and better pastures on the approach of winter, while some remain in the utmost north. It is not found in Greenland, Spitzbergen, or Siberia. The musk ox is scarcely equal in size to the smallest of Highland cattle, but appears larger from the profusion of long matted woolen hair with which it is covered, and which hangs almost to the ground. The head is covered with long hair as well as the body, the face alone having short hair. Beneath the long hair there is a thick coat of exquisitely fine wool. The head is large and broad; the forehead convex; the extremity of the muzzle hairy. The horns are very broad at the base, and in the male meet on the forehead; they do not rise but bend down on each side of the head, and curve outwards and upwards towards the tip, which tapers to a sharp point. They are about 2 ft. long measured along the curvature; and about 2 ft. in girth at the base; a pair of them sometimes weighing 60 pounds. The limbs are short, the legs have short hair. The tail is very short, and is covered with long hair, so that it is undistinguishable to the sight. The general color is brown. The female is smaller than the male, has shorter hair on the head, and is hornless. The front of the hoof is short and partially covered with hair; the foot marks are very similar to those of the reindeer.

The musk ox feeds on grass, twigs, lichens, etc. It is fleet and active, very sure-footed on rocky ground, and ascends or descends very steep hills with great ease. It is gregarious; the herds generally number 30 or 40. The powerful horns are excellent weapons of defense against wolves and bears, which are often not only repelled but killed. When musk oxen are assailed by firearms, however, they generally huddle more and more closely together, and do not even seek safety by flight, so long as the assailants are unseen. The flesh is much prized by the Esquimaux, but retains much of the strong musky odor which characterizes the living animal. The horns are used for various purposes; particularly the wide base for vessels. The fine wool has been spun and woven into a fabric softer than silk. No attempt has yet been made to domesticate the musk ox and Wildbeest, however, seems worthy of it, and suitable for all cold regions.

MUSK PLANT, Musk Root, Musk Tree, Musk Wood. Different parts of a number of plants small musk; some are strongly of musk. Among these are the common little musk plant (see MIMULUS), the musk-tree of Van Diemen's land (see ASTER), and the musk ochro (see HIBISCUS).—The musk tree of Jamaica (moschorygium scutellii) belongs to the

U. K. X.—29
natural order meliaceae. It emits from all parts a smell of musk.—All parts of guarea grandifolia, another tree of the same order, a native of the West Indies, sometimes called musk wood, also smells strongly of musk, but particularly the bark, which is used in perfumery.—The drug called Musk Root or SAMUEL is brought from the east, and is the root of a plant supposed to be of the natural order umbelliferae; but the plant is unknown, nor is it certain whether its native country is Persia, or some more remote region of central Asia. It has a pure musky odor, and is used as a substitute for musk.

**MUSK RAT,** or Desman (mygale or gateaux), a genus of insectivorous quadrupeds of the shrew (q.v.) family (soricidae), differing from the true shrews (sorci) in having two very small teeth between the two large incisors of the lower jaw, and the upper incisors flattened and triangular. Behind these incisors are six or seven small teeth (lateral incisors or false canine teeth) and four jagged molars. The muzzle is elongated into a small flexible proboscis, which is constantly in motion. The eyes are very small; there are no external ears; the fur is long, straight, and divergent; the tail long, scaly, and flattened at the sides. All the feet have five toes, fully webbed; and the animals are entirely aquatic, inhabiting lakes and rivers, and making holes in the banks with the entrance from beneath the surface of the water. Only two species are known, one (M. or G. pyrenicus) about 8 in. long, with tail as long as the body, a native of the streams of the Pyrenees; another larger species (M. or G. moschata), very plentiful in the Volga and other rivers and lakes of the s. of Russia, nearly equal in size to the common hedgehog, with tail about three-fourths of the length of the body. The Russian desman is blackish above, whitish beneath; it has long silky hair, with a softer felt beneath, and its fur is held in some esteem. Desman skins, however, are chiefly valued on account of the musky odor which they long exhalie, and which is derived from a fatty secretion produced by small follicles under the tail of the animal. The desman feeds on leeches, aquatic larve, etc., searching for them in the mud by means of its flexible proboscis. It seldom, if ever, voluntarily leaves the water, except in the interior of its burrows, which are sometimes 20 ft. long.

**MUSK RAT,** Sorci murinus, an Indian species of shrew (q.v.), in size about equal to the common brown rat, in form and color much resembling the common shrew of Britain, but remarkable for the powerful musky odor of a secretion which proceeds from glands on its belly and flanks. This odor adheres most pertinaciously to any object with which the animal may come in contact, and provisions are often utterly spoiled by it. Even wine and beer are said to be spoiled by it, in spite of the glass and cork of the bottle, although the probability is much greater that it adheres to the outside of the bottle, and that the liquid is spoiled as it is poured out. One of the Indian names of this animal is sundeli.

**MUSLIN,** a cotton fabric of oriental origin, is said to have derived its name from the town of Musul, in Mosopotamia, where this material was at one time very largely manufactured. At present no such trade exists there; and for muslins, of the common kinds at least, the Indian market depends upon the manufactures of England and France. But no European manufacturer has ever been able to rival the wonderfully fine muslins of Dacca. This does not arise so much from the fineness of the yarn, although that too is very great, but from the marvelous fineness conjoined with a most delicate softness to the touch. The fineness of the yarn is so great that until lately no machinery could produce anything like it; a piece of Dacca muslin, shown in the international exhibition (1862), was 31 ft. in length by 3 ft. in width and contained in a square inch 101 warp threads and 100 weft threads, yet the entire piece weighed only 31 ounces. A French manufacturer, M. Thivel Michon of Tavare, has made a muslin of English yarn spun by the Messrs. Houldsworth of Manchester, which surpassed the finest Dacca in the excessive fineness of the yarn, but it wanted its delicate softness. Muslin is much less compact in its texture than calico, indeed it more nearly resembles gauze in appearance; but it is woven plain, without any twisting of the weft threads with those of the warp. The manufacture of muslins in Great Britain and France is very extensive, especially printed muslins, in which the patterns are produced by the same processes as in calico-printing. See Weaving.

**MUSNUD,** a Persian throne of state.

**MUSOPHAGIDAE.** See Plantain-eater.

**MUSPRATT, James Sheridan, Ph.D., 1821-71:** b. Ireland; when a boy made a tour on the continent, and studied chemistry with prof. Graham of Glasgow. In 1838 he possessed sufficient knowledge of chemistry to take charge of the chemical department of a large Manchester manufacturer. After an unsuccessful business experiment in America, he resolved to devote himself entirely to the study of chemistry, which he pur sued under Liebig, at Giessen, 1843-45. There he published an edition of Plattner's Treatise on the Florpipes, and took the degree of Ph.D., with a thesis tracing the resemblance between the carbonates and sulphites. In 1847 he produced a number of new substances from the sulfo-cyanides of ethyl and methyl. On his return to England in 1848 he established and became superintendent of a college of chemistry at Liverpool. From 1854 to 1860 he was engaged on a dictionary of chemistry, which was also pub-
Musk. Mussey.

Bushed in this country and translated into French and German. His *Outlines of Quantities Analysis for Students* has had a considerable circulation,

**MUSQUASH. Muskrat, or Ondatra, Fiber zibethicus**, a rodent quadruped, a native of North America. It is the only known species of the genus to which it belongs which is characterized by dentition similar to that of the voles; in some other characters more nearly agreeing with the beaver. The musquash is in shape nearly similar to the brown rat; the head and body are about 15 in. in length, the tail 10 inches. The whole body is covered with a short downy dark-brown fur, intermixed with longer and coarser hairs. It is common in almost all parts of North America, from lat. 30° to lat. 69°, except in the southern alluvial districts. It is a very aquatic animal, seldom wandering from the rivers, lakes, or marshes in which it makes its abode. The fur is in demand, and forms an article of commerce—skins in large number being still exported from America to Britain and other European countries. The musquash burrows in the banks of streams and ponds; the entrances of its burrows being always under water, so that it must dive to reach them. In marshes the musquash builds a kind of hut, collecting coarse grasses and mud, and raising the fabric from 2 to 4 ft. above the water. The flesh of the musquash, at those seasons when it is fat, is in some request among the American Indians, and is said to be not unpalatable.

**MUSSEL. Mytilus, a genus of lamellibranchiate mollusks, the type of the family mytilidae**, which, however, is much more restricted than the Linnæan genus *mytilus*. The *mytilidae* belong to the division of *lamellibranchiata*, called by Lamarck *dymgyria*, having two *adductor muscles*—muscles employed in closing the valves of the shell. The mantle has a distinct anal orifice; the foot is small; and there is a large *byssus* (q.v.), which is divided into fibers to its base. The valves of the shell are equal; the hinge is destitute of teeth. Some, but few, of the species are found in fresh water. See *Dreissenia*. Some *lithodomus* burrow in stone. How they do it is utterly unknown, but they do burrow even in the hardest stone; and some small tropical species excavate for themselves holes in the shells of great limpets. The *lithodomus* are sometimes called *date-shells*. Some of them are very beautiful, which is the case also with the true *mussels*, after the epidermis is removed. Even the common *muskel* [*Mytilus edulis*] then exhibits beautiful veins of blue. This species is very abundant on the British coasts, and is much used as bait by fishermen. It is gregarious, and is found in vast beds, closely crowded, adhering by the byssus to rocks, etc. These beds are usually uncovered at low water. The shell is oblong; at its greatest size about 3 in. long, and an inch and a half broad. *Mussels*, when young, move about by means of the foot, with which they lay hold of objects and drag themselves along, until they find some suitable spot to anchor themselves by a byssus. If detached, they soon find another anchorage. In an aquarium they readily attach their byssus threads even to the smooth glass, and the threads may be broken more easily than separated from the glass. An ingenious and important application of the strength of these threads has been made by the French, to render Cherbourg breakwater more secure by binding the loose stones together, for which purpose it was projected with tons of *mussels*. The common *muskel* is much used as an article of food, and is generally found quite wholesome; yet it sometimes proves poisonous, particularly in spring and summer, either causing blotches, swellings, and an eruption, accompanied with asthma, or a kind of paralysis, and even sometimes producing delirium and death. For the *fresh-water mussel*, see that article.

**MUSSELBURGH**, a small sea-port and royal and parliamentary burgh of Scotland, in the county of Edinburgh, is situated at the mouth of the Esk, 6 m. e. of Edinburgh. On the west side of the Esk is the fishing village of Fisherrow. Tanning, leather-dressing, and the manufacture of sail-cloth, nets, &c. are carried on. The harbor at Fisherrow is frequented by coaling craft, and by small vessels from Holland and the Baltic. Timber, oil-cake, bark, seeds, and hides are imported; coal is the chief export. On the "links," a famous golfing ground, the Edinburgh races take place annually. Musselburgh unites with Leith and Portobello in sending a member to parliament. *Pop. 71, 7517.*

**MUSET, LOUIS CHARLES ALFRED de**, one of the foremost of recent French poets, was born at Paris Nov. 11, 1810. He studied in succession medicine, law, finance, and painting; but finally, under the influence of the romantic school (q.v.), d. voted himself to poetry. The first work that attracted notice was *Les Contes d'Esquanche et d'Italie* (1830), which by their elegant but audacious sensuousness gave deep offense. *Le Spectacle dans un Bateau* (1832) is a strange medley of contrasts. *Les Nuits* (1840) admirably show his lyrical power at its best. Many of the *Comédies et Proverbes* were popular on the stage; and Musset wrote several plays. In 1841, on the death of his father, Musset and his French academy. He died at Paris May 2, 1857. The exquisite beauty, tenderness, and power of much of Musset's work is continually marred by the morbid pessimism of a man prematurely old, disillusioned, *blasé*; on this very ground Musset is often regarded as the representative poet of the modern Parisian.

**MUSSEY, REUBEN DIMOND, an American surgeon; b. N. II., 1780; d. Boston, 1866; graduated at Dartmouth, 1803; Philadelphia 1809; practiced medicine and surgery at Salem 1809-14; professor of practice of medicine at Dartmouth 1814-19, and of anatomy and surgery from the latter date to 1838, when he removed to Cincinnati and
became professor of surgery in the Cincinnati college of medicine and surgery, occupying the chair till 1852, when he was appointed professor of surgery in the Miami medical college, where he remained till 1860, when he removed to Boston. He was a bold and successful operator, and was the first to ligate both common carotid arteries, an operation which was successful in its results.

**Mussulmán, Moslem, a Mohammedián (from Arab. Salama), equivalent to Moslem, of which word it is properly speaking, the plural; used in Persian fashion for the singular.** We need hardly add that this Arabic plural termination of "án" has nothing whatever to do with our word man, and that a further English plural in men is both barbarous and absurd.

**MUSTANG. See Horse.**

**Mustard, Sinapis, a genus of plants of the natural order crucifera, having yellow flowers, and linear or oblong pods, which terminate in a sword-shaped and compressed or 4-sided pointed beak, and contain one row of their cotyledons (q.v.). The most important species is Black Mustard (S. nigra), an annual, which grows wild in fields and by waysides in the middle and south of Europe, and is not uncommon in the southern parts of Britain. Its pods are bluntly 4-angled, smooth, erect, and lie close to the stem, their valves 1-nerved; the leaves are smooth, the lower leaves lunate, the upper leave linear-lanceolate. The seeds are brownish black.—White Mustard (S. alba), also a native of most parts of Europe, and of the southern parts of Britain, is an annual, having divergent pods covered with stiff hairs, the valves 5-nerved, the seeds yellowish, the leaves pinnatifid. Both these species are cultivated in England and elsewhere, for their seeds, which are ground into powder and mixed with water, to make the well-known condiment called mustard. The powder of the seeds is also much used in medicine as a rubefacient. The use of mustard as a condiment is often found favorable to digestion. Mustard seeds depend for their pungency on a principle which, when water is added to black mustard, forms volatile oil of mustard (Caius volatile). Thus, if the seeds are ground in water, which is obtained from them by expression, and constitutes about 28 per cent of their weight. The cake which remains after the oil is expressed is too acrid to be freely used for feeding cattle. It is black mustard which is chiefly cultivated, its seeds being more pungent and powerful than that of white mustard; but there is more difficulty in removing the skin of its seed than that of white mustard, which is therefore often preferred, but more in England than on the continent of Europe. Mustard requires a very rich soil. It is cultivated on the alluvial lands of the level eastern counties of England. Wisbeach, in Cambridgeshire, is the great mustard market of England. White mustard is often sown in gardens and forced in hot-houses, to be used in the seed-leaf as a small salad, having a pleasant pungency. It is also sometimes sown for feeding sheep, when turnip or rape has failed, being of very rapid growth, although inferior in quantity of crop.—Wild Mustard, or Charlock (S. arvensis), is distinguished by turgid and knotty pods with many angles and longer than the two-edged beak, is a most troublesome annual weed in cornfields in Britain, often making them yellow with its flowers in the beginning of summer. Its seeds are said to have yielded the original Durham mustard, and are still gathered for mixing with those of the cultivated species. The bland oil of the seeds is used for lamps.—PeKin Mustard (S. Pekinensis) is an annual, very extensively cultivated in China, its leaves being used as greens. It is quite hardy in the climate of Britain.—Indian Mustard (S. rosenso) is extensively cultivated in India for its seeds, which are used as a condiment; as are those of S. dichotoma and S. glauca, also cultivated in India. The oil of the seeds is much used throughout India for lamps.—Hull Mustard is a different genus, bunifer (q.v.). The Mustard Tree of Scripture is supposed to be salutaris Persica, a small tree of the natural order salisolarnea, a small order allied to myrtiflorae. It abounds in many parts of the east. The seed has no aromatic pungency, and is used like mustard.

**Manufacture.** The manufacture of mustard as it was originally used in this country, and as it still is on the continent, consisted in simply grinding the seed into a very fine meal. A false taste, however, arose for having an improved color, and the flour of mustard was introduced, in which only the interior portion of the seed is used, the husk being separated, as the bran is from wheaten flour. This causes a great loss of flavor, as the pungent oil, on which the flavor chiefly depends, exists in greatest abundance in the husk.—Hence other materials, such as capsicum powder, and other very pungent matters, are added to bring up the flavor, and wheaten flour and other substances are added to increase the bulk and the lightness of color. Indeed, so many sophistications have been added that the mustard of the English tables can no longer be regarded in any other light than an elaborately compounded condiment, for which each manufacturer has his own particular recipe.

**Mustard, Oil of.** The seeds both of the black and the white mustard yield by expression a large quantity of a bland fixed oil, but they do not contain any essential or volatile oil readily formed. It is only the black mustard which by distillation yields the compound usually known as the oil or essence of mustard, and which is in reality sulphocyanide of allyl (see Garlic. Oil of) contaminated with a little brown resinous matter, from which it may be freed by simple re-distillation.
When first obtained, it is a colorless fluid, which gradually becomes yellowish. It has a painfully pungent odor and acrid taste; and when applied to the skin, it speedily raises a blister. It is soluble in all proportions in alcohol, but dissolves very sparingly in water. In the article already referred to, it has been shown that this oil and oil of garlic are naturally convertible into one another; in combination with ammonia it forms a compound which is termed thiosinaminine, and which combines directly with acids like a true organic base. Its mode of formation is explained by the equation:

\[ \text{Oil of Mustard} + \text{Ammonia} \rightarrow \text{Thiosinaminine} \]

\[ C_{4}H_{4}C_{5}N_{3}S_{2} + \text{NH}_{3} = C_{4}H_{4}C_{5}N_{3}S_{2} \]

By digesting oil of mustard with alkalies, or with hydrated oxide of lead, we also obtain a feeble base termed sinapoline, whose formula is \( C_{4}H_{4}C_{5}N_{3}O_{2} \).

The oil is formed in much the same way as the volatile oil of almonds (q.v.). The black mustard contains the potash salt of a compound termed myronic acid, and a peculiar coagulable nitrogenous ferment, which, when the crushed seed is moistened with water, acts upon each other, and develops the oil. It is the gradual formation of this oil, when powdered mustard and warm water are mixed, that occasioned the special action of the common mustard poultice. The pungency of mustard as a condiment, of horse-radish, etc., is mainly due to the presence of this oil.

**MUSTELIDÆ**, a family of digitigrade carnivora (q.v.), mostly forming the genus *Mustela* of Linnaeus; now divided into a number of genera, in which are ranked the weasel, ermine or stoat, marten, ferret, polecat, mink, skunk, etc. The mustelids are distinguished by the elongated form of the body and the shortness of the limbs; also by having generally four or five molars on each side in the upper jaw, and five or six in the lower. On each side of both jaws there is a single tuberculate tooth. All the feet have five toes. The skull is much elongated behind the eyes. The mustelids display great litheness and suppleness of movement. They are very carnivorous. Outers are ranked among the mustelids.

**MUSTER** (It. mostrare, from Lat. monstrare, to show) is a calling over of the names of all the men composing a regiment or a ship's company. Each man present answers to his name, those not answering being returned as absent. The muster-roll from which the names are called is the pay-master's voucher for the pay he issues, and must be signed by the commanding officer, the adjutant, and himself. The crime of signing a false muster-roll, or of personating another individual at a muster, is held most severely punishable—by imprisonment and flogging for a common soldier, by immediate cashiering in the case of an officer. In regiments of the line a muster is taken on the 24th of each month; in ships of war, weekly. The muster after a battle is a melancholy proceeding, intended to show the casualties death has wrought. In early times, before the army was a standing force, and when each captain was a sort of contractor to the crown for so many men, the muster was most important as the only security the sovereign had that he really obtained the services of the number of men for whom he paid. Accordingly, any fraud, as making a false return, or as mustering with his troop men not actually serving in it, was by the articles of war of Henry V. made punishable with death for the second offense, and by Charles I., with death "without mercy" for even the first such crime; while any personabetting in any way in the fraud shared the penalty.

**MUTE**, a small instrument used to modify the sound of the violin or violoncello. It is made of hard wood, ivory, or brass, and is attached to the bridge by means of a slit, a leg of it being interlaced between every two strings. The use of the mute both softens the tone and imparts to it a peculiar muffled and tremulous quality, which is sometimes very effective. Its application is indicated by the letters c.s., or con sordino, and its discontinuance by s.s., or senza sordino. The mute is sometimes used for the cornet, being inserted into the bell of the instrument, thereby subduing the sound and producing the effect of great distance.

**MUTINY** (Fr. mutiner, from mutin, "riotous." "Muten" is connected with the old French moter, still seen in émoute, a "sedition," and is therefore from the Latin movere, "to move" or "stir up." The supposition that the word is derived from the Latin mutare, a "muttering," is a mistake). The term is used to denote behavior either by word or deed subversive of discipline, or tending to undermine superior authority. Till lately mutiny comprised speaking disrespectfully of the sovereign, royal family, or general commanding, quarreling, and resisting arrest while quarreling; but these offenses have now been reduced to the lesser crime of "mutinous conduct." The acts now constituting mutiny proper are exciting, causing, or joining in any mutiny or sedition; when present thereat, failing to use the utmost effort to suppress it; when, knowing of a mutiny or intended mutiny, failing to give notice of it to the commanding officer; striking a superior officer, or using or offering any violence against him while in the execution of his duty; disobeying the lawful command of a superior officer. The punishment awarded by the mutiny act to these crimes is, if the culprit be an officer, death or such other punishment as a general court-martial shall award: if a soldier, death,
penal servitude for not less than four years, or such other punishment as a general court-martial shall award. As the crime of mutiny has a tendency to immediately destroy all authority and all cohesion in the naval or military body, commanding officers have strong powers to stop it summarily. A drum-head court-martial may sentence an offender, and if the case be urgent, and the spread of the mutiny apprehended, the immediate execution of the mutineer may follow within a few minutes of the detection of his crime. It, however, behooves commanding officers to exercise this extraordinary power with great caution, as the use of so absolute an authority is narrowly and jealously watched. To prevent mutiny among men the officers should be strict without harshness, kind without familiarity, attentive to all the just rights of their subordinates, and, above all things, most particular in the carrying out to the very letter of any promise they may have made.

**MUTINY ACT** was an act of the British parliament passed from year to year, investing the crown with powers to regulate the government of the army and navy, and to frame the articles of war. By the bill of rights, the maintenance of a standing army in time of peace, unless by consent of parliament, was declared illegal, and from that time the number of troops to be maintained, and the cost of the different branches of the service, have been regulated by an annual vote of the house of commons. But parliament possesses a further and very important source of control over the army. Soldiers, in time of war or rebellion, being subject to martial law, may be punished for mutiny or desertion; but the occurrence of a mutiny in certain Scotch regiments soon after the revolution, raised the question whether military discipline could be maintained in time of peace; and it was decided by the courts of law, that, in the absence of any statute to enforce discipline and punish military offenses, a soldier was only amenable to the common law of the country: if he deserted, he was only liable for breach of contract, or if he struck his officer, to an indictment for assault. The authority of the legislature thus became indispensable to the maintenance of military discipline, and parliament has, since 1689, at the beginning of every session, conferred this and other powers in an act called the mutiny act, limited in its duration to a year. Although it is greatly changed from the form in which it first passed, 155 years ago, the annual alterations in this act are now very slight, and substantially it has a fixed form which the above quoted declaration from the bill of rights, and adds that it is judged necessary by the sovereign and parliament that a force of such a number should be continued, "for the safety of the United Kingdom, the defense of the possessions of the crown;" while it gives authority to the sovereign to enact articles of war for the control and government of the force granted. The act comprises 107 clauses, of which the first five specify the persons liable to its provisions—viz., all enlisted soldiers or commissioned officers on full pay, and to those of the regular army, militia, or yeomanry, when employed on active service, and to recruits for the militia while under training. Clauses 6 to 14 relate to courts-martial, their procedure and powers. Clauses 15 to 28 relate to crimes and their punishment, the leading offenses being mutiny, desertion, cowardice, treason, insubordination, for each of which death may be the penalty; frauds, embezzlement, etc., for which penal servitude is awarded. Clauses 29 to 53 provide for the government of military prisons, and the treatment of soldiers in civil jails, under the sentences of courts-martial. Clauses 34 to 37 enact rules to guide civil magistrates in apprehending deserters or persons suspected of desertion. Clause 38 refers to furlough; 59 to 41, on the privileges of soldiers, enact that officers may not be sheriffs or mayors; that no person acquitted or convicted by a civil magistrate or jury be tried by court-martial for the same offense; and that soldiers can only be taken out of the service for debts above £50, and for felony or misdemeanour. Clauses 42 to 59 have reference to enlistment (q.v.); to stoppages, billets, carriages, and ferrys, providing for the compulsory conveyance and entertainment of troops by innkeepers. Clause 75 relates to the discharge of soldiers; and the remaining 23 clauses advert to miscellaneous matters, and the penalties under the act on civil functionaries who neglect to comply with its requirements. By clauses 105 and 106 the militia, yeomanry, and volunteers, may, on emergency, be attached to the regular forces. Clause 107 renders a soldier liable to maintain his wife and children, and his bastard children.

**MUTIUS SC^VOLA.** See MUTIUS SC^VOLA.

**MUTSUHITO or Mutsu-hito.** The present reigning emperor of Japan, and the 123rd mikado of the line. His name means the "man of peace," or "weak man." He has no family name. His is the second son of the mikado Komei Tenno (1847-67); his mother Fujiwara Asako. He was born Nov. 3, 1859, and grew up in the palace at Kioto, never seeing a foreigner until his nineteenth year. On the death of his father Jan. 30, 1867, he was declared emperor under the regency of the mikado of Iwakura and others, Jan. 3, 1868, the regent was dismissed. Mutsuhito became the active mikado, and the new government was proclaimed; the decree abolishing forever the office of "tycoon" being dated Feb. 4. On March 23 he gave the first audience ever granted by an emperor of Japan to representatives of Christian nations, the envoys of France and Holland being admitted. The British minister (see PARKER, Sir H. S.) who on the 27th attempted a similar audience, had his cortège attacked by assassins. On March 28 the imperial decree was issued by which treaty relations with foreign
nations were for the first time acknowledged by the mikado, and all fanatics who should attack foreigners were outlawed. On April 6, in the great hall of the castle of Nijie in Kioto, occurred the most momentous act of his life, and thence dates the real beginning of modern Japan. In presence of the court nobles and feudal princes (daimio) the mikado took the oath which is now the basis of the new government. The first clause of this oath is as follows: "The practice of discussion and debate shall be universally adopted, and all measures shall be adopted by public argument." Besides this he promised that the "uncivilized customs of former times" should be broken through, and intellect and learning sought for throughout the world, to assist in leading Japan into the path of modern civilization. From this oath the reforms of the past twelve years have proceeded, and the drift of Japanese politics toward constitutional government has begun. On Feb. 7, 1869, he removed the national capital to Tokio, and soon after married Ichijo Tadaka, a noble lady of the 2d degree of the 1st rank. In 1872 he adopted European dress and habits of life, and has since made many tours throughout the empire, completely revolutionizing the old traditional court and governmental etiquette.

MUTTRA, or MATHURĂ, a t. of British India, capital of a district in the n.w. provinces, 97 m. s.s.e. of Delhi, is situated on the right bank of the Jumna. The fort was built by the celebrated astronomer, Joy Singh (who became prince of Amber in 1683); and on the roof of one of the apartments is a ruinous observatory, containing a great number of astronomical instruments. Access is had to the river—which, along with the town, is considered sacred by the Hindus—by numerous gâhs, ornamented with little temples; and its banks are, every morning and evening, crowded by devotees of all ages and both sexes, to perform their religious exercises. In Hindu mythology, it is regarded as the birthplace of the divinity Krishna. In honor of the monkey-god Hanumân, monkeys are here protected and fed, being allowed to swarm everywhere. There are also great numbers of paroquets, peacocks, and sacred bulls at large, without owners. There is a very extensive military cantonment about a mile s. of the town. Muttra appears at an early period to have been of much more importance than it is at present; and its enormous wealth and splendor made it an object of attack to the first Afghan invaders. Mahmud of Ghuznâe, in 1017, gave it up to plunder, breaking down and burning all the idols, and amassing a vast quantity of gold and silver, of which the idols were made. After this calamity, it sank into comparative obscurity. In Oct., 1803, it was, without resistance, occupied by the British troops. Pop. 372,592.

MUTUAL INSTRUCTION. See Monitorial System.

MUTUL, a plain block under the crown of the cornece of the Doric style, similar in position to the medallio of the Corinthian order, and having a number of guttes or drops worked on the under side. See Entablature.

MUYSCAS, or CHIBELAS, a nation of Indians w. of the Andes, in New Granada, as far as the vicinity of Santa Fé de Bogota. They seem to have been the nearest in civilization to the Quichuans. They were quickly Christianized, and, like all these tribes, on the expulsion of the Jesuits, decreased rapidly in numbers and intelligence. It seems uncertain whether the language is really extinct, but it was simple, and is usually considered unconnected with any neighboring group.

MUZÀ IBN NOSEYR, the Arab conqueror of Spain, was born 640 A.D. He displayed great bravery and high military talents in the contests of that turbulent period, so much so that he was appointed by the caliph general of the army which was raised for the conquest of Africa in 686-99. After an insignificant expedition into the interior of Africa, he set out in 707 for Mauritania, conquering the kindred tribes of eastern Barbary, and enrolling their warriors under his standard; and by 709 the whole of northern Africa, including the Gothic strongholds on the coast, acknowledged the authority of the caliph. At this period the Gothic monarchy in Spain was in a state of complete disorganization, and Muza Ibn Noseyr, seizing the favorable opportunity thus presented, sent his lieut., Tarik Ibn Zeïd, in April, 711, to make an incursion into Spain. Tarik landed at Gibraltar, marched inland to the banks of the Guadalete, where he was met by Roderic the Gothic king. In the battle which ensued the Goths were decisively vanquished, their king perished in the waters of the Guadalete, and the whole of southern Spain lay at the mercy of the victor. Muza Ibn Noseyr, on hearing of these successes, sent orders to Tarik to halt for further instructions; but the lieutenant, flushed with success, pressed on to the very center of Spain, and on April 20, the capital of the Gothic kingdom, Muza Ibn Noseyr immediately set out for Spain at the head of 18,000 men (June, 712), took Seville, Carmona, Merida, and other towns, and then marched upon Toledo, where he joined Tarik, whom he caused to be bastinadoed and incarcerated, but afterwards reinstated in obedience to an order from the caliph. Muza Ibn Noseyr then marched first n. w. and then e., subduing the country as he went; he then crossed the Pyrenees into France, but soon after returned to Spain, where he and Tarik received messages from the caliph, commanding their immediate presence at
Damascus; Tarik immediately obeyed, but Muza Ibn Nosey delayed till a second message was sent to him. On reaching Damascus he was treated with neglect, and, on the accession of the caliph Sulaiman, was cast into prison, and mututed in 200,000 pieces of gold; his two sons were deprived of their governments of Kairwan and Tangier; and the third son, who governed Spain in his father's absence, was beheaded, and his head sent to Muza. Muza Ibn Nosey died soon after in the greatest poverty, at Hedjaz, 717 A.D.

MUZIANO, GIROLAMO. 1528-90; b. Aquafreda, near Brescia, Italy; hence his title, Bresciano. His first instructor was the painter Girolamo Rom anino. He afterwards studied at Venice and Rome, and devoted himself to the painting of landscapes. His earliest important painting, "The Resurrection of Lazarus," attracted the attention of Michael Angelo, who was so struck by its bold and accurate design that he took Mu ziano under his protection and secured for him a large number of commissions. Muziano made a study of mosaics, and vastly improved that branch of art. He founded and richly endowed the famous academy of St. Luke. The most of his pictures are in the churches and palaces of Rome, where he spent the larger part of his life. Among them may be mentioned: "St. Jerome," and a "Descent from the Cross" (Borghese palace); "St. Jerome" (Doria palace); "St. Francis" (Mattei palace); "Resurrection of Lazarus" (Vatican); "St. Matthew and St. Paul" (Ara Coeli); "Annunciation" (St. Urban's); "Nativity of Jesus Christ" (Madonna de' Monti); "St. Nicholas" (St. Louis-des-Français); "Cristo Morto" (Santa Caterina); "Jesus Christ giving the Keys to St. Peter," and a "Flagellation" (in the sacristy of St. Peter's). His frescoes are to be seen in the Vatican, at Foligno, etc. The ceilings of Bologna, Dresden, Ratisbon, and the Louvre possess specimens of Muziano's work. His designs in India ink are highly prized. He is distinguished for his excellence in design and coloring; for the nobility of his conceptions, and the characteristic expression of his faces. His frescoes are sometimes rather sharp and hard in outline and color. Died in Rome, honored as one of the greatest painters in the school of Michael Angelo.

MUZZEY, ARTEMAS BOWERS, b. Mass., 1802; educated at Harvard college and the Harvard divinity school. He was settled over the Unitarian church in Framingham in 1830, and was afterwards minister of Unitarian churches in Cambridgeport, Cambridge, and Concord, N. H. His last charge was at Newburyport, Mass., where he remained till 1865, when he retired from the pulpit. Among his numerous works, aside from sermons and tracts, may be mentioned: The Young Man's Friend, 1836; The Young Maiden, 1840, which had a great success; Moon a Soul, 1842; The Sabbath-School Hymn and Tune Book, 1855; The Blade and the Ear, 1864; and The Higher Education, 1871.

MYCITES, a genus of extinct lamellibranchiate mollusks, belonging to the family

mytilidae. They commenced their existence in the Silurian formation, and extended through the triassic and Jurassic into the cretaceous, where they became extinct. They had a gaping ventricose shell, with an external ligament.

MYCALE, the ancient name of a mountain now called Samson, in the s. of Ionia in Asia Minor. It terminates in the promontory cape Santa Maria, opposite the island of Samos. The strait between the island and the promontory is where the great nava, victory of the Greeks over the Persians took place 479 B.C.

MYCLEIUM, in botany, a development of vegetable life peculiar to fungi, but apparently common to all the species of that order. The spores of mushrooms is the mycelium. The mycelium appears to be a provision for the propagation of the plant where its spores may not reach, its extension in the soil or matrix in which it exists, and its preservation when circumstances are unfavorable to its further development. It consists of elongated filaments, simple or jointed, situated either within or upon its surface. It is often membranous or pulpy. The development of the fungus in its proper form seems to be ready to take place, in proper circumstances, from any part of the mycelium. Fungi often remain long in the state of mycelium, and many kinds of mycelium have been described as distinct species and formed into genera. Fries has rendered great service to botany in investigating these spurious species and genera, and determining their true nature. Liquors in which the flocculent mycelium of a fungus is spreading are said to be nothery.

MYCENE, a very ancient city in the north-eastern part of Argolis, in the Peloponnesus, built upon a raggy height, is said to have been founded by Perseus. It was the capital of Azanemon's kingdom, and was at that time the principal city in Greece. About 465 B.C., it was destroyed by the inhabitants of Argos, and never rose again from its ruins to anything like its former prosperity. It Strabo's time its ruins only remained; these are still visible, though in the neighborhood of Stymphal and Nemea, and are very fine examples of Greek and Cretan architecture. The most celebrated is the "Gate of Lions," the chief entrance to the ancient Acropolis. Excavations prosecuted at Mycena by Dr. Henry Schliemann brought to light in 1876 several ancient tombs, containing a large quantity of gold and silver ornaments, etc.

MYCETES, a genus of South American monkeys. See Howler, ante.

MYELI TIS (myelos, marrow), is the term employed to signify inflammation of the substance of the spinal cord. It may be either acute or chronic, but the latter is by far the
most common affection. The chronic form begins with a little unceasiness in the spine, somewhat disordered sensations in the extremities, and unusual fatigue after any slight exertion. After a short time paralytic symptoms appear, and slowly increase. The gait becomes uncertain and tottering, and at length the limbs fail to support the body. The paralysis finally attacks the bladder and rectum, and the evacuations are discharged involuntarily; and death takes place as the result of exhaustion, or occasionally of asphyxia if the paralysis involves the chest. In the acute form there is much pain (especially in the spinal region), which usually ceases when paralysis supervenes. The other symptoms are the same as those of the chronic form, but they occur more rapidly and with greater severity, and death sometimes takes place in a few days.

The most common causes of this disease are falls, blows, and strains from over-exertion; but sexual abuses and intemperate habits occasionally induce it. It may also result from other diseases of the spine (as caries), or may be propagated from inflammation of the corresponding tissue of the brain.

The treatment, which is much the same as that of inflammation elsewhere, must be confined entirely to the medical practitioner; and it is therefore unnecessary to enter into any details regarding it. When confirmed paralysis has set in, there is little to hope for, but in the early stage the disease is often checked by judicious remedies.

MYENSK, a t. of European Russia, in the government of Orel, on the Zusho. It has thirteen churches, and a pop. of nearly 13,000. It has a lively trade chiefly in spirits, soap, hemp, and dried fruits.

MYER, ALBERT J., 1828-80, b. N. Y.; son of a jeweler who established himself in that business in Buffalo, N. Y., while Albert was a child. He graduated at Hobart college, Geneva, N. Y., in 1847; and, returning to Buffalo, began the study of medicine with Dr. Frank H. Hamilton, and took his degree of m.d., at the university of Buffalo in 1851. In 1854 he was appointed assistant surgeon in the U. S. army, and assigned to Texas, where he first developed his now celebrated signal system, and which was adopted by the secretary of war for the use of the army. From 1858 to '60 Myer was a signal officer with the rank of major. On the outbreak of the war he was made signal officer on the staff of gen. Butler, and afterwards on that of gen. McClellan, and was successively brevetted lieut. col., col., and brig. gen.; his last promotion being for "distinguished services in organizing, instructing, and commanding the signal corps of the army, and for especial service on Oct. 5, 1864, at Allatoona, Ga."

MYERS, PETER HAMILTON, b. N. Y. 1812; made his first appearance as an author, in 1848, when he published The First of the Knickerbockers, a Tale of 1673. He has since written a number of novels, among which are The Young Patroon, 1848; The King of the Hurons; and The Prisoner of the Border, 1857. He has published also a book of poems called Euseneo, a Romance of Onewso Lake.

MYGALAE, a genus of spiders, the type of a family Mygalidae. They have four pulmonar y sacs and spiracles, four spinnerets, eight eyes, and hairy legs. They make silken nests in clumps of trees, rocks, etc., or in the ground, sometimes burrowing to a great depth, and very tortuously. To this genus belongs the bird-catching spider (q.v.) of Surinam; but it seems now to be ascertained that several of the larger species frequently prey on small vertebrate animals. They do not take their prey by means of webs, but hunt for it and pounce upon it by surprise. They construct a silken dwelling for themselves in some sheltered retreat. Some of them make a curious lid to their nest or burrow. They envelop their eggs, which are numerous, in a kind of cocoon.
of earth, the mother, who conceives from the sun, Bel or Baal. Mylitta and Baal together are considered the type of the "Good." Procreation thus being the basis of Mylitta's office in nature, the act itself became a kind of worship to Mylitta, and was followed through and for her. Thus it came to pass, that every Babylonian woman had once in her life to give herself up to a stranger, and thereby considered her person consecrated to the great goddess. The sacrifice itself seems, especially in the early stage of its introduction among the divine rites of the primitive Babylonians, to have had much less of the repulsiveness, which, in the eyes of highly cultivated nations, must be attached to it; and it was only in later days that it gave rise to the proverbial Babylonian lewdness. Herodotus's account of this subject must, like almost all his other stories, be received with great caution.

**MYLIOBATIDÆ.** See Ray.

**MY LODON** (Gr. grinder-teeth), a genus of huge fossil sloths, whose remains are found in the Pliocene deposits of South America, associated with the *Megatherium* and other allied genera. A complete skeleton, dug up at Buenos Ayres, measured 11 ft. from the fore part of the skull to the end of the tail. Although like the modern sloth in general structure and dentition, its immense size forbids us to suppose that it could have had the same arboreal habits, and the modifications of its structure seem to have fitted it for the uprooting and prostrating of the trees, the foliage of which supplied it with food.

**MY NIAS,** more accurately *Minyas,* was, in Greek mythology, the son of Chryses. He was king of Jokros, and gave his name to the people called *Minyces.* He built the city of Orchomenus, where rites (named after him) were selected in his honor. His three daughters, Clymene, Iris, and Alcithoe, according to Ovid, but Leucouët, Leucippe, and Alcihoë according to other authors, were changed into bats for having contemned the mysteries of Bacchus.

**MYNPURI,** or *MAINPURI,* a t. of British India, capital of a district in the n.w. provinces, is situated on the banks of a small affluent of the Ganges. 160 m. s.e. of Delhi. It lies at an elevation of 620 ft. above the sea, and is a favorite station for troops, as provisions and water are abundant and good. Mynpuri possesses a Jain temple. The rebels were driven from this place in 1857. *Pop. 71, 21,179.*

**MYOSO TIM.** See Forget-me-not.

**MYOXIDÆ.** A family of rodents commonly known as dormice. From their resemblance to many of the squirrels and marmots they have sometimes been placed in the family *Sciuridae.* The common dormouse, *myaxus avellanarius,* is a well-known hibernating British species. The family are confined to the old world, and contain about 12 species. They have 4 rooted molars on each side of the jaw, a rudimentary thumb, and are destitute of a cecum. See Rodentia.

**MYRIA CIA,** a genus of trees of the natural order *Myrtaceae,* to which belongs the Wild Clove or Wild Cinnamon of the West Indies (*myrtoces acris,* a handsome tree of 20 or 30 feet high. Its timber is very hard, red and heavy. Its leaves have an aromatic cinnamon-like smell, and an agreeable astringency, and are used in sauces. Its berries are round, and as large as peas, have an aromatic smell and taste, and are used for culinary purposes.

**MYRIAGRAM.** See Metric System.

**MYRIAM'ETER.** See Metric System.

**MYRIAPODA** (Gr. myriad-footed), a class of *Articulata,* resembling *Annelida* in their lengthened form, and in the great number of equal, or nearly equal, segments of which the body is composed; but in most of their other characters more nearly agreeing with insects, among which they were ranked by the earlier naturalists, and still are by some. They have a distinct head, but there is no distinction of the other segments, as in insects, into thorax and abdomen. They have simple or compound eyes; a few are, destitute of eyes. They have antennæ like those of insects. The mouth is furnished with a complex masticating apparatus, in some resembling that of some insects in a larval state, in others, similar to that of crustaceans. Respiration is carried on through minute pores or spiracles, placed on each side along the entire length of the body, the air being distributed by innumerable ramifying air-tubes to all parts. In most parts of their internal organization, the myriapoda resemble insects; although a decided inferiority is exhibited, particularly in the less perfect concentration of the nervous system. The resemblance is greater to insects in their larval than in their perfect state. The body of the myriapoda is protected by a hard *chitinous* covering. The number of segments is various, seldom fewer than 24; although in some of the higher genera they are consolidated together in pairs, so that each pair, unless closely examined, might be considered as one segment bearing two pairs of feet. The legs of some of the lower kinds, as *Julus* (q.v.) are very numerous, and may be regarded as intermediate between the bristle-like appendages which serve many annelids as organs of locomotion, and the distinctly articulated legs of insects. In the higher myriapoda, as *Scolopendra,* the legs are much fewer, and articulated like those of insects. None of the myriapoda have wings. Some of them feed on decaying organic matter, chiefly vegetable; those of higher organization are carnivorous. The myria, *i.e.,* do not undergo changes so great
as those of insects, but emerge from the egg more similar to what they are ultimately to become; although some of them are at first quite destitute of feet; and, contrary to what takes place in insects, the body becomes more elongated as maturity is approached, the number of segments and of feet increasing.

The myriapoda are divided into two orders: the lower, Chilopoda (Julus, etc.), having the body sub-cylindrical, the feet very numerous, the head rounded, the mandibles thick and strong; the higher Chilopoda (Scolopendra, etc.), having the body flattened, the feet comparatively few, the head broad, the mandibles sharp and curved.

The myriapoda are found in all parts of the world, in the ground, among moss, under stones, in the decaying bark of trees, in decaying roots, and in many similar situations. The largest species are tropical. They are all generally regarded with aversion. It is doubtful how far any of them are injurious to crops, although it is not improbable that they accelerate rottenness already begun; but some (Centipedes) have a venomous and painful bite.

**MYRICA.** See Candleberry.

**MYRISTICACEAE.** See Nutmeg.

**MYRISTIC ACID** \((C_6H_{11}O_5\cdot H_2O)\) is a crystalline fatty acid, found in the seeds of the common nutmeg, *Myristica moschata*. It occurs in the form of a glycercide in the fat of the nutmeg, or nutmeg butter. It has recently been found in small quantity amongst the products of the saponification of spermaceae, and of the fatty matter of milk; and hence this organic acid must be ranked amongst those which are common both to the animal and vegetable kingdoms.

**MYRMECO BIUS,** the banded ant-eater of Australia. See Marsupialia.

**MYRMECO PHAGA.** See Ant-eater.

**MYRMELEON.** See Ant Lion, ante.

**MYRMI'DONES,** an ancient people in Phthiotis, in s. Thessaly. According to the legends, they were so called from Myrmidon, a son of Jupiter, and son-in-law of Xolos. Myrmidon's son, Actor, married Ægina, daughter of Asopus. Another story says they came from Ægina, and were ants (myrmékes), changed by Jupiter into men. They settled in Thessaly with Pelens, with whose son Achilles, they went to the Trojan war. The name has come to denote, in England, a troop or great horde of ruffians devoted to a single leader.

**MYROBALANS,** the astringent fruit of certain species of *Terminalia*, of the natural order Combretaceae, natives of the mountains of India. The genus *Terminalia* has a deciduous bell-shaped calyx and no corolla; the fruit is a juicy hard drupe. *T. Belbovii*, a species with alternate elliptical entire leaves, on long stalks, produces great part of the myrobalans of commerce; but the fruits of other species often appear under the same name. Tonic properties are ascribed to myrobalans; but although once in great repute, they are now scarcely used in medicine. They are used, however, by tanners and by dyers, and have therefore become a very considerable article of importation from India. They give a durable yellow color with alum, and, with the addition of iron, an excellent black.— *Emblica myrobalans* are the fruit of *Emblica officinalis*, of the natural order Euphorbiaceae, a native of India. They are used in India as a tonic and astringent; also in tanning and in the making of ink.—There is a kind of plum called the Myrobalan Plum. See Plum.

**MYRON,** about B.C 480—430; native of Bœotia; Athenian sculptor and engraver of wood and silver; studied under Ageladas at Argos. His first great production was the statue of a cow, so wonderfully life-like that it was mistaken for the real animal by cattle. Myron, as Pliny observes, excelled not in expression but in realistic imitation of men and animals. Perhaps his most noted work was the "Discobolus," or quoit-thrower. The bronze image of the cow stood in Athens for many centuries, and was then taken to Rome, where it was known to be as late as the sixth century. Several statues were discovered in the last century, which it was claimed were the work of Myron, and one or two are almost certainly original. The British museum has an ancient marble copy of the "Discobolus."

**MYRRH** (Heb. myr), a gum produced by *balanodesmon* (q.v.) *myrrha*, a tree of the natural order Anmryridaceae, growing in Arabia, and probably also in Abyssinia. The myrrh tree is small and scrubby, spiny, with whitish-grey bark, thinly-scattered small leaves, consisting of three obovate obliquely toothed leaflets, and the fruit a smooth brown ovate drupe, somewhat larger than a pea. Myrrh exudes from the bark in oily yellowish drops, which gradually thicken and finally become hard, the color at the same time becoming darker. Myrrh has been known and valued from the most ancient times; it is mentioned as an article of commerce in Gen. xxxvii. 25, and was amongst the presents which Jacob sent to the Egyptian ruler, and amongst those which the wise men from the east brought to the infant Jesus. It was an ingredient in the "holy anointing oil" of the Jews. Myrrh appears in commerce either in tears and grains, or in pieces of irregular form and various sizes, yellow, red, or reddish brown. It is brittle, and has a waxy fracture, often exhibiting whitish veins. Its smell is balsamic, its taste aromatic and bitter. It is used in medicine as a tonic and stimulant, in disorders of the digestive
organs, excessive secretions from the mucous membranes, etc., also to cleanse foul ulcers and promote their healing, and as a dentifrice, particularly in a spongy or ulcerated condition of the gums. It was much used by the ancient Egyptians in embalming. The best myrrh is known in commerce as Turkey myrrh, being brought from Turkish ports; as the name East Indian myrrh is also given to myrrh brought to Europe from the East Indies, although it is not produced there, but comes from Abyssinia. It is not yet certainly known whether the myrrh tree of Abyssinia is the same as that of Arabia, or an allied species.

**Myrsina C.E.E.** a natural order of exogenous plants, consisting of trees and shrubs, natives of warm climates, and having simple leathery leaves, destitute of stipules; hermaphrodite or unisexual flowers, generally small, but often in umils, corymbs, or panicles; very similar in structure to the flowers of the primulaceae; the fruit generally fleshy, with 1 to 4 seeds. The flowers are very often marked with sunken dots or glangular lines.—There are more than 300 known species. Many of them are beautiful evergreen shrubs, particularly the genus *artisia*. Some have peppery fruit, as *embelia ribes*.

**Myrica C.E.E.** a natural order of exogenous plants, consisting of trees and shrubs, natives chiefly of warm, but partly also of temperate countries. The order, as defined by the greater number of botanists, includes several suborders, which are regarded by some as distinct orders, particularly Chamelaucinaceae (in which are contained about 50 known species, mostly beautiful little bushes, often with fragrant leaves, natives of New Holland), Barringtoniaceae (q.v.), and Lecythidaceae (q.v.). Even as restricted, by the separation of these, the order contains about 1300 known species. The leaves are entire, usually with pelucid dots, and a vein running parallel to them near the margin. Some are aromatic and have gigantic trees, as the *eucalyptus* or guai tree of New Holland, and different species of *metrosideros*, of which one is found as far s. as Lord Auckland's islands, in lat. 50°S. The timber is generally compact.—Astringency seems to be rather a prevalent property in the order, and the leaves or other parts of some species are used in medicine as astringents and tonics. A fragrant or pungent volatile oil is often present in considerable quantity, of which *oil of oreganum* and *oil of cloves* are examples. *Cloves* and *pimento* are amongst the best known products of this order. The berries of several species are occasionally used as spices in the same way as the true pimento. A considerable number yield pleasant edible fruits, among which are the *pomegranate*, the *guava*, species of the genus *logania*, and some species of *myrtle*.

**Myrtle, Myrtus**, a genus of *myrtaceae*, having the limb of the calyx 4 to 5 parted, 4 to 5 petals, numerous free stamens, an almost globose germen, and a 2 to 3 celled berry, crowned with the limb of the calyx, and containing kidney shaped seeds. The leaves are opposite and marked with pelucid dots; the flower-stalks are axillary, and generally one-flowered. The common myrtle (*M. communis*) is well known as a beautiful evergreen shrub, or a tree of moderate size, with white flowers. It is a native of all the countries around the Mediterranean sea, and of the temperate parts of Asia, often forming thickets, which sometimes occur even within the reach of the sea-spray. The leaves are ovate or lanceolate, varying much in breadth. They are astringent and aromatic, containing a volatile oil, and were used in medicine by the ancients as a stimulant. The berries are also aromatic, and are used in medicine in Greece and Italy. A myrtle wine, called *myrtillanum*, is made in Tuscany. Myrtle bark is used for tanning in many parts of the south of Europe. Among the ancient Greeks the myrtle was sacred to Venus, as the symbol of youth and beauty, was much used in festivals, and was, as it still is, often mentioned in poetry. The myrtle endures the winters of Britain only in the mildest situations in the south.—The small-leaved myrtle of Peru (*M. microphylla*) has red berries of the size of a pea, of a pleasant flavor and sugary sweetness. Those of the *Luma* (*M. lumina*) are also palatable, and are eaten in Chili; as are those of the Downy myrtle (*M. tomentosa*), on the Neigherry hill; and those of the Whiteribbed myrtle (*M. lanceolata*), by some regarded as a variety of the common myrtle, in Greece and Syria. The berries of this species or variety are larger than those of the common myrtle, and have a very pleasant taste and smell.—A very humble species of myrtle (*M. cumanularia*) spreads over the ground in the Falkland islands, as thyme does in Britain.

**Myrtle-wax.** See Wax.

**Mysia**, in ancient geography, a province in n.w. Asia Minor, joining Lydia on the s. and Bithynia on the e., and bounded w. by the Hellespont and n. by the Propontus; the principal rivers were the Caicus, Ægusus, and Rhynacrus; the surface is mountainous in the interior, and in part table-land. The inhabitants were thought by some ancient writers to be of Thracian, and by others of Lybian descent; probably there were immigrations from both countries. Homer mentions the Mysi, but does not define their country. Mysia was subject to the Lydian monarchy, and under the Persian dominion formed, together with Lydia, one of the satrapies created by Darius. After the death of Alexander the Great, it passed from Macedonian to Syrian rule, was then given to the kings of Pergamus by Rome, and afterwards made a Roman province. Its principal towns were Abydos, Cyzicus, and Pergamus.
MY SIS, a genus of podophthalmous (stalk-eyed) crustaceans, of the order stomatopoda, much resembling the common shrimps in form, although differing from them in the external position of the gills. They are often called opposum shrimps, because the last two fangs are furnished with an appendage, which in the female forms a large pouch, and in the male the eggs are received after they leave the ovary, and are not laid till the young acquire a form very similar to that of the parent, when the whole brood of young is set at once set free into the ocean. Species of myis are found on the British shores, but they are far more abundant in the Arctic seas, where they form no small part of the food of whales, and of many fishes, particularly of different species of salmon.

MYSORE, or MAISRUR, a raji or principality of southern India, under the protection of the British government, in lat. 11° 55' to 15° n., and in long. 74° 45' to 78° 45' east. It is bounded on the n. by the British collectorate of Dharwar, and otherwise surrounded by districts belonging to the Madras presidency. The area is 37,000 sq. m.; the population in 1871-72 was 5,055,412. Mysore is an extensive table-land, with an average elevation of about 2,000 ft., and with a slope principally towards the n. and n.e. The chief rivers are the Cauvery, flowing s.e., and the Tungabhadra, the Hugri, and the Penwar, flowing n. and n.e. The climate of the higher districts is during a great portion of the year healthy and pleasant. In 1871-72, the value of the exports, which consist of betel-nut, cotton, cardamoms, rice, silk, and sugar, amounted to £1,100,000. The imports, consisting mainly of iron, gold, pepper, salt, and pulses, were £1,070,000. Since 1859 the control of the country has been entirely in the hands of the English, and is administered by a British commissioner. Chief town, Mysore. For the history of Mysore, see articles HYDER ALI, TIPU S AHIB, and INDIA.

MYTAGOGUE (Gr. μυστής, an initiated person, and αἰγός, a lead), the name in the Greek religious system of the priest whose duty it was to direct the preparations of the candidates for initiation in the several mysteries, as well as to conduct the ceremonial of initiation. It was sometimes applied by a sort of analogy to the class of professional εὐεργεῖτε, who in ancient, as still in modern times, undertook to show strangers newly arrived in a city the noteworthy objects which it contained; but the former meaning is its primitive one, and formed the ground of the application of the same name in the Christian church, to the catechists or other clergy who prepared candidates for the Christian mysteries, or sacraments, of baptism, of confirmation, and the eucharist, especially the last. In this sense the word is constantly used by the fathers of the 4th and 5th centuries; and in the well-known lectures of St. Cyril of Jerusalem, although all were addressed to candidates for the mysteries, some for baptism, and some for the eucharist, it is only the lectures addressed to the latter that the name μυταγογή is applied. This distinction was connected with the well-known Discipline of the Secret; and it appears to have ceased with the abolition or gradual disuse of that discipline.

MYSTERIES (Gr. from μύω, to close the lips or eyes), also called Ῥεβατα, Ὀργία, or, in Latin, Initia, designate certain rites and ceremonies in ancient, chiefly Greek and Roman, religions, only known to, and practiced by, congregations of certain initiated men and women, at appointed seasons, and in strict seclusion. The origin, as well as the real purport of these mysteries, which take no unimportant place among the religious festivals of the classical period, and which, in their ever-changing nature, designate various places of religious development in the antique world, is all but unknown. It does seem, indeed, as if the vague speculations of modern times on the subject were an echo of the manifold interpretations of the various acts of the mysteries given by the priests to the inquiring disciple—according to the lights of the former or the latter. Some investigators, themselves not entirely free from certain mystic influences (like Creuzer and others), have held them to have been a kind of mystic orb around a kernel of pure light, the bright rays of which were too strong for the eyes of the multitude; that, in fact, they hid, under an outward garb of mummary, a certain portion of the real and eternal truth of religion, the knowledge of which had been derived from some primeval, or, perhaps, the Mosaic revelation; if it could not be traced to certain (or all) of the Egyptian mysteries generally, certainly to the kind of hazy rite whatever (which we only mention because it is still repeated ever now and then), the real and thorough investigations begun by Lobeck, and still pursued by many competent scholars in our own day, have, or ought to have, put an end. There cannot be anything more alien to the whole spirit of Greek and Roman antiquity than a hiding of abstract truths and occult wisdom under rights and formulas, songs and dances; and, in fact, the mysteries were anything but exclusive, either with respect to sex, age, or rank, in point of initiation. It was only the speculative tendency of later times, when Poly-
Mysteries.

350

theism was on the wane, that tried to symbolize and allegorize these obscure, and partly imported ceremonies, the bulk of which had undoubtedly sprung from the midst of the Pelasgian tribes themselves in prehistoric times, and which were intended to represent and to celebrate certain natural phenomena in the visible creation. There is certainly no reason to deny that some more refined minds may, at a very early period, have endeavored to impart a higher sense to these wondrous performances; but these can only be considered as solitary instances. The very fact of their having to be put down in later days as public nuisances in Rome herself, speaks volumes against the occult wisdom inculcated in secret assemblies of men and women.

The mysteries, as such, consisted of purifications, sacrificial offerings, processions, songs, dances, dramatic performances, and the like. The mystic formulas (Dolichenuna, Dromaena, Legomena, the latter including the Liturgies, etc.) were held deep secrets, and could only be communicated to those who had passed the last stage of preparation in the mystagogue's hand. The hold which the nightly secrecy of these meetings, together with their extraordinary worship, must naturally have taken upon minds more fresh and childlike than our advanced ages can boast of, was increased by all the mechanical contrivances of the effects of light and sound which the priests could command. Mysteries, voices, the sound of singing, whispering, and sighing all around, lights gleaming in manifold colors from above and below, figures appeared and disappeared; the mimic, the tonic, the plastic—all the arts, in fact, were taxed to their very utmost to make these performances (the nearest approach to which, in this country, is furnished by transformation-scenes, or sensation-dramas in general) as attractive and profitable (to the priests) as could be. As far as we have any knowledge of the plots of these mysteries as scenic representations, they generally brought the stories of the special gods or goddesses before the spectator—their births, sufferings, deaths, and resurrection. Many were the outward symbols used, of which such as the Phallus, the Thyrus, flower baskets, mystic boxes, in connection with special deities, told, more or less, their own tale, although the meanings supplied by later ages, from the Neo-platonists to our own day, are various, and often very amazing. The most important mysteries were, in historical times, those of Eleusis and the Thesmophorian, both representing—each from a different point of view—the rape of Persephone, and Cerer's search for her: the Thesmophorian mysteries being also in a manner connected with the Dionysian worship. There were further, those of Zeus of Crete—derived from a very remote period—of Bacchus himself, of Cybele, and Aphirodite—the two latter with reference to the mystery of propagation, but constructed in diametrically opposed ways, the former culminating in the self-mutilation of the worshipper, the latter in prostitution. Further, the mysteries of Orpheus, who, in a certain degree, was considered the founder of all mysteries. Nor were the other gods and goddesses forgotten: Hera, Minerva, Diana, Hecate, nay, foreign gods like Mithras (q.v.), and the like, had their due secret solemnities all over the classical soil, and whatsoever Greek (and partly Roman) colonists took their Lares and Penates all over the antique world. The beginning of the reaction in the minds of thinking men, against this mostly gross and degenerated kind of veneration of natural powers and instincts, is marked by the period of the Hesiodic poems; and when, toward the end of the classical period, while the preceding long age of mystery drama straggled on, and the bent of souls was still rough, and many things of this kind, their days were numbered. The most subtle metaphysicians, allegorize and symbolize as they might, failed in reviving them, and in restoring them to whatever primeval dignity there might have once been inherent in them.

MYSTERIES AND MIRACLE-PLAYS were dramas founded on the historical parts of the Old and New Testaments, and the lives of the saints, performed during the middle ages, first in churches, and afterwards in the streets on fixed or movable stages. Mysteries were properly taken from biblical and miracle-plays from legendary subjects, but this distinction in nomenclature was not always strictly adhered to. We have an extant specimen of the religious play of a date prior to the beginning of the middle ages in the Chrisiod Pseochn, assigned, somewhat questionably, to Gregory Nazianzen, and written in 4th c. Greek. Next comes six Latin plays on subjects connected with the lives of the saints, by Roswitha, a nun of Gandersheim, in Saxony, who, along with her brother, was educated at Mount Hildesheim and had some education and interest; they have been lately published at Paris, with a French translation. The performers were at first the clergy and choristers, afterwards any layman might participate. The earliest recorded performance of a miracle-play took place in England, Matthew Paris relates that Geoffrey, afterwards abbot of St. Albans, while a secular, exhibited at Dunstable the miracle play of St. Catherine, and borrowed copies from St. Albans to dress his characters. This must have been at the end of the 11th or beginning of the 12th century. Fitzstephen, in his Life of Thomas à Becket, 1183 A.D., describes with approval the representation in London of the sufferings of the saints and miracles of the confessors. On the establishment of the Corpus Christi festival by Pope Urban IV, in 1264, miracle-plays became one of its adjuncts, and every considerable town had a fraternity for their performance. Throughout the 15th and following centuries, they continued in full flower in England, and are mentioned, sometimes reprovingly, sometimes approvingly, by contemporary writers. Designed at first as a means of religious instruction for the people, they had long before the reformation so far departed from their original character, as to
be mixed up in many instances with buffoonery and irreverence, intentional or unintentional, and to be the means of inducing contempt rather than respect for the church and religion. Remarkable collections exist of English mysteries and miracles of the 15th c., known as the Chester, the Coventry, and the Townley plays. The first two have been published by the Shakespeare Society, and the other by the Surtees Society. The Townley mysteries are full of the burlesque element, and contain many curious illustrations of contemporary manners.

Mysteries, Moralities, and miracle-plays sprang a third class of religious plays called dramatis personae. These personages at first only took part in the play along with the scriptural or legendary characters, but afterwards entirely superseded them. The oldest known English compositions of this kind are of the time of Henry VI.; they are more elaborate and less interesting than the miracle-plays. Moralities continued in fashion till the time of Elizabeth, and were the immediate precursors of the regular drama.

Mysteries and miracles were as popular in France, Germany, Spain, and Italy as in England. A piece of the kind yet extant, composed in France in the 11th c., is entitled the Mystery of the Wise and Foolish Virgins, and written partly in the Provencal dialect and partly in Latin. A celebrated fraternity, called the Confrerie de la Passion, founded in Paris in 1550, had a monopoly for the performance of mysteries and miracle-plays, which were of such a length, that the exhibition of each occupied several days. A large number of French mysteries of the 14th c. are extant. In the alpine districts of Germany, miracle-plays were composed and acted by the peasants; these peasant-plays had less regularity in their dramatic form, were often interspersed with songs and processions; and in their union of simplicity with high-wrought feeling were most characteristic of a people in whom the religious and dramatic element are both so largely developed. In the early part of the last century, they began to partake to a limited extent of the burlesque, which had brought the miracle-plays into disrepute elsewhere.

It is a mistake to suppose that the hostility of the reformers was what suppressed these exhibitions. The fathers of the reformation showed no unfeelingly feeling towards them. Luther is reported to have said that they often did more good and produced more impression than sermons. The most direct encouragement was given to them by the founders of the Swedish Protestant Church, and by the earlier Lutherans, bishops, Swedish and Danish. The authorship of one demand of the kind is ascribed to Grotius. In England the greatest check they received was from the rise of the secular drama; yet they continued to be occasionally performed in the times of James I. and Charles I., and it is well known that the first sketch of Milton's Paradise Lost was a sacred drama, where the opening speech was Satan's Address to the Sun. A degenerate relic of the miracle-play may yet be traced in some remote districts of England, where the story of St. George, the dragon, and Beelzebub, is rudely represented by the peasantry. Strange to say, it was in the Catholic south of Germany, where these miracle-plays and mysteries had preserved most of their old religious character, that the severest blow was levelled against them. Even there, they had begun to be tinctured to a limited extent with the burlesque element, which had brought them into disrepute elsewhere. In 1779 a manifesto was issued by the prince-archbishop of Salzburg, condemning them, and prohibiting their performance, on the ground of their licentious mixture of the sacred and the profane, the frequent bad acting in the serious parts, the distraction of the lower orders from more edifying modes of instruction, and the scandal arising from the exposure of sacred subjects to the ridicule of freethinkers. This ecclesiastical denunciation was followed by vigorous measures on the part of the civil authorities in Austria and Bavaria. One exception was made to the general suppression. In 1653 the villagers of Oberammergau, in the Bavarian highlands, on the cessation of a plague which desolated the surrounding country, had vowed to perform every tenth year the Passion of Our Savior, out of gratitude, and as a means of religious instruction; a vow which had ever since been regularly observed. The piousness of a deputation of Ammergau peasants with Max. Joseph of Bavaria saved their mystery from the general condemnation, on condition of everything that could offend good taste being expunged. It was then and afterwards somewhat remodelled, and is perhaps the only mystery or miracle-play which has survived to the present day. The last performance took place in 1870. The inhabitants of this secluded village, long noted for their skill in carving in wood and ivory, have a rare union of artistic cultivation with perfect simplicity. Their familiarity with sacred subjects is even beyond what is usual in the alpine part of Germany, and the spectacle seems still to be looked on with feelings much like those with which it was originally conceived. What would elsewhere appear impious, is to the alpine peasants devout and edifying. The personage of Christ considers his part an act of religious worship; he and the other principal performers are said to be selected for their holy life, and consecrated to their work with prayer. The players, about 500 in number, are exclusively the villagers, who, though they have no artistic instruction, except from the parish priest, act their parts with no little dramatic power, and a delicate appreciation of character. The New Testament of narrative plays strictly adhered to, the only addition, to it being the St. Veronica handkerchief. The acts alternate with tableau from the Old Testament and choral odes. Many thousands of the peasantry are attracted by the spectacle from all parts of the Tyrol and Bavaria, among whom the same earnest and devout demeanor
prevalts among as the performers. Plays of a humbler description, from subjects in legendary or sacred history, are not unfrequently got up by the villagers around Insbruck, which show a certain rude dramatic talent, though not comparable to what is exhibited at Ammergau. Girls very generally represent both the male and female characters.

MYSTICETE, a name of the whalebone whale, a cetacean of the family balanidse, or toothless whales, see WHALE and CETACEA, ante.

MYSTICISM (Gr. mystikos, mystical), a term used with considerable vagueness, but implying that general tendency in religion to higher and more intimate communication with the divine, to which, in most religions, ancient and modern, certain individuals or classes have had claim. In the Platonic philosophy, and in the eastern systems, from which that philosophy is derived, the human soul being regarded as a portion of the divine nature, it is held to be the great end of life to free the soul from the embarrassment and mental darkness in which it is held by the material trammels of the body in which it is imprisoned. In the pursuit of this end, two very opposite courses were adopted: the first, that of spiritual purification, partly by representing the natural appetites and weakening the sensual impulses by corporeal austerities, partly by elevating the soul through intense contemplation and withdrawal from the outward objects of sense; the other, that of regarding the soul as superior to the body, independent of its animal impulses, incapable, from its higher origin, of being affected by its outward actions, or sufficed by contact with the corruption in which its lower nature might love to wallow. A similar element of mysticism, which, in truth, must form in some sense a constituent of every religious system, is traceable in the early doctrinal history of Christianity, and the career of Christian mysticism also divides itself into the same twofold course. Among the early sects external to the church, we trace the first in the system of Tatian and of the Eunomites, while the second finds its parallel in the Syrian gnostics, in Carpocrates, Bardisanes, and in one form at least of the Nicolaitic heresy. Within the Christian church there never has been wanting a continuous manifestation of the mystical element. The language of St. Paul in Gal. ii. 20, and in 2d Cor. xii. 2, and many expressions in the Apocalypse, may be taken as the exponents of Christian mysticism, the highest aspiration of which has ever been toward that state in which the Christian "no longer liveth, but Christ liveth in him." And although no regular scheme of mysticism can be found in the early fathers, yet the writings of Hermas the shepherd, the epistles of St. Ignatius, the works of St. Clement of Alexandria, the expositions of Origens, and above all, the confessions of St. Augustine, abound with outpourings of the true spirit of Christian mysticism. It is curious that the first systematic exposition of its principles is said to be in the works of pseudo-Dionysius the Areopagite; but it was not till the days of the Scholastics that it received its first development, when the mystic life was resolved into its three stages, viz., of purification, of illumination, and of ecstatic union with God and absorption in divine contemplation. It was upon the explanation of this third stage that the great division of the medieval mystic schools mainly turned; some of them explaining the union with God in a pantheistic or semipantheistic sense, and thereby annihilating the individual will, and almost the personal action in man in the state of ecstasy; others, with St. Bernard, fully preserving both the individual liberty and the freedom of man, even in the highest spiritual communication with his Creator. Of the former, many, as the Ileschists (q.v.) in the Greek church, and the brethren of the free spirit (q.v.) and the Beghards in the Latin, drew from these mystical doctrines the most revolting moral consequences; in others, as Taunier, Ruysbroek, Ekkart, the error does not seem to have gone beyond the sphere of speculation. The writings of Thomas a Kempis (q.v.), of St. Catherine of Siena, of St. John of the cross, and of St. Teresa, may perhaps be taken as the most characteristic representations of the more modern form of the traditional mysticism which has come down from the mystics of the middle ages.

The later history of mysticism in the Roman Catholic church will be found under the heads of PENELOX, MADAME GUYON, MOLINOS, and QUIETISM. The most remarkable followers of the same or kindred doctrines in the Protestant communions are Jacob Boéme (q.v. of Gorliith, Emmanuel Swedenborg (q.v.), and the celebrated William Law (q.v.).

MYTH and MYTHOLOGY. The word myth (Gr. mythos) originally signified speech or discourse, and was identical with the word logos. After the age of Pindar and Herodotus, however, it came to be synonymous with the Latin word fabula, fable or legend. According to the present use of our language, a myth is an idea or fancy presented in the historical form; and though, of course, any fiction at any time in this shape might be called a myth, yet by usage the word is confined to those fictions made in the early periods of a people's existence, for the purpose of presenting their religious belief, and generally their oldest traditions, in an attractive form. The tendency to create myths in this way seems inherent in every people; certainly there is no people so sunk into the brute as to be without them. A myth is not to be confounded with an allegory; the one being an unconscion act of the public mind at an early stage of society, the other a conscious act of the individual mind at any stage of social progress. The parables of the New Testament are allegorical; so are .Esop's fables; no one mistakes them for realities;
they are known to have been invented for a special didactic purpose, and so received. But the peculiarity of myths is, that they are not only conceived in the narrative form, but generally taken for real narrations by the people to whom they belong, so long as they do not pass a certain stage of intellectual culture. Even myths of which the allegorical significance is pretty plain, such as the well-known Greek myth of Prometheus and Epimetheus, were received as facts of early tradition by the Greeks. Myths may be divided into several classes, of which the first and most important is the theological and moral. The oldest theology of all nations is in the form of myths; hence the great importance of mythological study, now universally recognized; for it is not occupied merely or mainly with strange fancies and marvelous fictions, invented for the sake of amusement, but contains the fundamental ideas belonging to the moral and religious nature of man as they have been embodied by the imaginative faculty of most favored races. It is this dominance of the imagination, so characteristic of the early stages of society, which gives to myth its peculiar dramatic expression, and stamps the popular creed of all nations with the character of a poetry of nature, of man, and of God. From the very nature of the case, the myth-producing faculty exercises itself with exclusiveness only under the polytheistic form of religion; for there only do a sufficient number of celestial personages exist, whose attributes and actions may be exhibited in a narrative form; there is nothing, however, to prevent even a monotheistic people from exhibiting certain great ideas of their faith in a narrative form, so as by prosaic minds to be taken for literal historical facts. But besides strictly theological myths, there are physical myths, that is, fictions representing the most striking appearances and changes of external nature in the form of political history; in which view, the connection of legends about giants, chimeras, etc., with regions marked by peculiar volcanic phenomena, has been often remarked. It is difficult indeed, in polytheistic religion, to draw any strict line between physical and theological myths; as the divinity of all the operations of nature is the first postulate of polytheism, and every physical phenomenon becomes the manifestation of a god. Again, though it may appear a contradiction, there are historical myths; that is, marvelous legends about persons, who may with probability be supposed to have actually existed. So intermingled, indeed, is fact with fable in early times, that there must always be a kind of debatable land between plain theological myth and recognized historical fact. This land is occupied by what are called the heroic myths; that is, legends about heroes, concerning whom it may often be doubtful whether they are merely a sort of inferior, and more human-like gods, or only men of more ordinary powers whom the popular imagination has elevated into demi-gods. Thus a remarkable feature of mythology commenced with the most ancient nation who produced it, specially with the acute and speculative Greeks. The great mass of the Greek people, indeed—of whom we have a characteristic type in the traveler Pausanias—accepted their oldest legends, in the mass, as divine and human facts; but so early as the time of Euripides, or even before his day in the case of the Sicilians, Epicharmus and Empedocles, we find that philosophers and poets had begun to identify Jove with the upper sky, Apollo with the sun, Juno with the nether atmosphere, and so forth; that is, they interpreted their mythology as a theology and poetry of nature. This, indeed, may be regarded as the prevalent view among all the more reflective and philosophical heathens (who were not, like Xenophon, orthodox believers) up from the age of Pericles, 450 B.C., to the establishment of Christianity. But there was an altogether opposite view, which arose at a later period, under less genial circumstances, and exercised no small influence both on Greek and Roman writers. This view was first prominently put forth by Euhemerus, Messene, in the time of the first Ptolemies, and consisted in the flat prosaic assertion, that the gods, equally with the heroes, were originally men, and all the tales about them only human facts sublimed and elevated by the imagination of pious devotees. This view seemed to derive strong support from the known stories about the birth and death of the gods, specially of Jove in Crete; and the growing skeptical tendencies of the scientific school at Alexandria, were of course favorable to the propagation of such views. The work of Euhemerus accordingly obtained a wide circulation; and having been translated into Latin, went to nourish that current form of religious skepticism which was one of the most notable symptoms of the decline of Roman genius at the time of the emperors. Historians, like Diochares, gladly adopted an interpretation of the popular mythology which promised to swell their stores of reliable material; the myths accordingly were coolly emplotted of the poetic soul which inspired them, and the early traditions of the heroic ages were set forth as plain history, with a grave sobriety equally opposed to sound criticism, natural piety, and good taste.

In modern times, the Greek mythology has again formed the basis of much speculation on the character of myths and the general laws of mythical interpretation. The first tendency of modern Christian scholars, following the track long before taken by the fathers, was to refer all Greek mythology to a corruption of Old Testament doctrine and history. Of this system of interpreting myths, we have examples in Vossius, in the learned and fanciful works of Bryant and Faber, and very recently, though with more pious and poetic feeling, in Gladstone. But the Germans, who have taken the lead here, as in other regions of combined research and speculation, have long ago given up this ground as untenable, and have introduced the rational method of interpreting every system of myths, in the first place, according to the peculiar laws traceable in its own.
genius and growth. Ground was broken in this department by Heyne, whose views have been tested, corrected, and enlarged by a great number of learned, ingenious, and philosophical writers among his own countrymen, specially by Buttmann, Voss, Creuzer, Muller, Welcker, Gerhard, and Pfeiffer. The general tendency of the Germans is to start—as Wordsworth does in his Excursion, book iv.—from the position of a devout imaginative contemplation of nature, in which the myths originated, and to trace the working out of these ideas, in different phases and at different times, with the most critical care, and the most vivid reconstruction. If in this work they have given birth to a large mass of ingenious nonsense and brilliant guess-work, there has not been wanting among them abundance of sober judgment and sound sense to counteract such extravagances. It may be noticed, however, as characteristic of their over speculative intellect, that they have a tendency to bring the sway of theological and physical symbols down into a region of what appears to be plain historical fact; so that Achilles becomes a water-god, Pelcus a mud-god, and the whole of the Iliad, according to Forchhammer, a poetical geology of Thessaly and the Troad! Going to the opposite extreme from Euhemerus, they have denied the existence even of defined heroes: all the heroes of Greek tradition, according to Uschold, are only degraded gods; and generally in German writers, a preference of transcendental to simple and obvious explanations of myths is noticeable. Creuzer, some of whose views had been anticipated by Blackwell, in Scotland, is especially remarkable for the high ground of religious and philosophical conception on which he has placed the interpretation of myths; and he was also the first who directed attention to the oriental element in Greek mythology—not, indeed, with sufficient discrimination in many cases, but to the great enrichment of mythological material, and the enlargement of philosophical survey. In the most recent times, by uniting the exclusive method of Creuzer with the correction supplied by the more critical method of O. Muller and his successors, the science of comparative mythology has been launched into existence; and specially the comparison of the earliest Greek mythology with the sacred legends of the Hindus, has been ably advocated by Max Muller in the Oxford Essays (1856). In France, the views of Euhemerus were propounded by Banier (1739). By the British scholars, mythology is a field that has been very scantily cultivated. Besides those already named, Payne Knight, Mackay, Grote in the first volumes of his history, and Keightley are the only names of any note, and their works can in no wise compete in originality, extent of research, in discriminating criticism, or in largeness of view, with the productions of the German school. The best for common purposes is Keightley; the most original, Payne Knight. Recently, G. W. Cox, in a work on Aryan mythology, has pushed the sanguine tendencies of Max Muller to an extreme which to most minds seems absurd. On the special mythologies of India, Rome, Greece, etc., information will be found under the heads of the respective countries to which they belong. The more important mythological personages are noticed under their own names; see Bacchus, Jupiter, Hercules, etc.

MYTLENE, or MYTILENE, CITY. See CASTRO, ante.
MYTLENE, or MYTILENE, ISLAND. See Lesbos, ante.

MYTHIDAE. See Mussel, ante.

MYYXINE, a genus of cartilaginous fishes, synonymous with the gastro-branchia of Bloch, of which the myxine glutinosa or glutinous hog is the type. See Hae, ante.

MYZONTS. See Myxinoids.

N

N, the fourteenth letter of the English alphabet is one of the nasal liquids of the lingual class. See Letters. Its Hebrew (and Phenician) name, N, is signified a fish, which its original form was probably meant to represent. N is interchangeable with l, (q.v.) and M, as in collect, communicle, confer; and in Ger. bluten, compared with Eng. button. In Latin, this letter had a faint, uncertain sound at the end of words and in some other positions, especially before s. This accounts for words on having lost the n in the nominative case, though retaining it in the oblique cases, as homo, hominis; and for Greek names like Platon being written without the final n in Latin. The dull, muffled pronunciation of n, which is indicated by such words as consul, censor, testamento, being frequently spelled consul, censors, testament, was the first stage of the modern French nasal n. Before a guttural letter, n naturally assumes the sound of ng, as bank.

NABIS, d. 192 B.C., b. Sparta; usurped the throne of Lacedaemon on the death of king Machanidus, in 207. He put to death the son of the late king Lycurgus, and by threats or torture exacted large sums of money from the rich. He was thus able to raise a considerable army, with which he endeavored to capture the city of Messene. Philopoemen, the commander of the forces of Megalopolis, repulsed him, but the next year Nabis gained the advantage over the Megalopolitans. It seems to have been the design of Nabis to restore the Spartan hegemony in the Peloponnesus, but in 195, he was forced
to make peace with the Romans, whose army under Plaminius had besieged Sparta. In 192, being at war with the Achilians, he asked and from the Etolians, who furnished him with a small contingent, really for the purpose of destroying him; and their general Alexander speedily assassinated him.

NAAS, a market and assize t. of Kildare co., Ireland, 20½ m. s.w. of Dublin, and, next to Athy, the largest town in the county. The population in 1871 was 3,660. The principal street is about half a mile in length; the county court-house is in the main street. Having been anciently the seat of the kings of Leinster, Naas was early occupied by the English. A parliament was held in it in 1149, and it obtained charters successively from Henry V., Elizabeth and James I. At present, Naas is a place of little trade, and is almost entirely without manufactories. It returned two members to the Irish parliament, but was disfranchised at the Union. It is the seat of a diocesan school, and of three national schools, one of which is attached to the Roman Catholic convent. A newspaper, printed at Maryborough, is also published here.

NABUS. See NA'BULUS, ante.

NABOB, or NA'BA, a corruption of the word nabíb (deputy), was the title belonging to the administrators, under the Mogul empire, of the separate provinces into which the district of a subahdár (q.v.) was divided. The title was continued under the British rule, but it gradually came to be applied generally to natives who were men of wealth and consideration. In England, and especially in Britain, it is applied derisively to those who, having made great fortunes in the Ladies, return to their native county, where they live in oriental splendor.

NA'BULUS. See NABULUS, ERAS or, was the starting-point of Babylonian chronology, and was adopted by the Arabs as the place of Alexandria Berenice and others. It began with the accession of Nabonassar to the throne—an event calculated (from certain astronomical phenomena recorded by Ptolemy) to have taken place Feb. 26, 747 B.c.

NABULUS, or Nabulus (a corruption of the Gr. Ναυπόλης, New City, the name given to it in the reign of Vespasian), anciently called SUCHEM or SUHEN, in the New Testament (John iv. 5). SYCHAR; is a t. of Palestine, possessing, it is said, "the only beautiful site from Dan to Beersheba." It lies between mount Ebal and mount Gerizim, on the s. side of the valley of Erd-Mkham, and has a population variously estimated at from 8,000 to 14,000 of whom about 500 are Christians, 150 Samaritans, 50 Jews; the rest are Mohammedans, fierce, turbulent, and fanatic. The houses are pretty good, but the streets (as usual in the East) are narrow, gloomy, and filthy. The chief productions are soap, cotton, and oil—the soap manufactories are large, and the oil is considered the best in Syria.—See Porter's Handbook for Syria and Palestine, and Stanley's Palestine.

NACHITIGAL, Gustav, b. Germany, 1834; studied medicine, which he practiced in Algeria, 1853-63. He then became a physician in the military service of the bey of Tunis, who soon made him his private medical adviser. In 1869 he started for Kuka, joining a caravan which was dispatched to carry from the king of Prussia to the sheikh of Borada, some gifts in recognition of his services to various German explorers. After a stay in the Tibo country, he set out for Kuka, where he arrived in 1876. He made a thorough exploration of Bornoo, from which he went on several exploring expeditions. He went to lake Tchad, and collected a large store of materials in regard to the geography of the s. districts of Sahara. Making his way to Baghiruni, he followed up the Shari river and its tributaries. In the spring of 1878, he set out for Egypt, going s. of lake Tchad, through Waday which he was the first European to penetrate. He visited Abeshr, the capital of Waday, passed through the kingdom of Darfoor, and arrived at Cairo, Nov. 1874. An account of his explorations is given in his Die Tributäre von Heidenkinder Baghirunis, published in 1874.

NACOGDOCHES; a co. in s. Texas, bounded on the e. by Attoyac river, and on the s.w. by the Angelina river; 900 sq. m.; pop. '80, 11,592-11,511 American birth, 3,040 colored. The surface is undulating and hilly, and much of it covered with a thick growth of forests. The soil is generally fertile, and particularly adapted to raising corn and cotton. Other productions are sweet potatoes, barley, and sorghum molasses. Co. seat, Nacogdoches.

NACRE. See Mother of Pearl.

NADAL, Bernhard H., D.D., LL.D., 1813-79; b. Maryland; admitted as a preacher in the Methodist Episcopal church by the old Baltimore conference in 1835. He was the pastor of 15 churches in different states n. and south. While a pastor he was a diligent student, and when stationed at Carlisle in 1848 he graduated at Dickinson college, pursuing his studies in connection with his pastoral work. He also taught classics in college. In 1849 he supplied the pulpit of an Independent church in Baltimore. In 1854-57 he was professor at the Indiana Asbury university. In 1857, returning to the Baltimore conference, he was made presiding elder of the Roanoke district in Virginia. During the slavery agitation at this time he vigorously defended his church and conference. In sermons and addresses he earnestly espoused and aided the cause of the national government in the war of the rebellion, and enjoyed the friendship of President Lincoln. In 1869 he became professor of historical theology in Drew seminar at Madison.
Nadir, Nagasaki.

son, N. J., and after the death of Dr. McClintock was acting president, but was soon removed by death. He was an able preacher, a vigorous and polished writer, and contributed largely to periodicals. He was one of the editors of the Methodist, of whom Dr. Crooks said that “in writing he was almost without a peer in the American Methodist church.” He was a thorough scholar and highly esteemed as an instructor.

NADIR, an Arabic word signifying that point in the heavens which is diametrically opposite to the zenith, so that the zenith, nadir, and center of the earth are in one straight line. The zenith and nadir form the poles of the horizon (q.v.). See ZENITH.

NADIR SHAH, of Persia, belonged to the Afshars, a Turkish tribe, and was born near Kelat, in the center of Khorassan, Persia, in 1688. When 17 years old, he was taken prisoner by the Usbecks, but escaped after four years of captivity; entered the service of the governor of Khorassan, and soon obtained high promotion. Having, however, been degraded and punished for some real or supposed offense, he betook himself to a lawless life, and for several years was the daring leader of a band of 3,000 robbers, who levied contributions from almost the whole of Khorassan. An opportunity having occurred, Nadir seized the town of Kelat, and gradually extended his territorial power. Persia was at this time ruled by Melek Ashraf, an Afghan of the tribe of Ghiljë, whose grinding tyranny and cruelty produced in the mind of every Persian a deadly hatred of the very name Afghan, which exists to this present day. Nadir having avowed his intention of expelling the hated race from the country, and restoring the Saffawean dynasty, numbers flocked to his standard, and Meshed, Herat, and all Khorassan were speedily reduced. Ashraf, signally defeated in several engagements, fled before the avenger, who, with a celerity only equaled by its thoroughness, purged the provinces of Irak, Fars, and Kerman of even the semblance of Afghan domination. The assassination of Ashraf, during his retreat, terminated the war. The rightful heir, Tamasp, then ascended the throne, and Nadir received for his services the government of the provinces of Khorassan, Mazanderan, Selstan, and Kerman, assuming at the same time the title of Tamasp-khâl (the slave of Tamasp), the title of khân being subsequently added. He was sent against the Turks in 1731, and defeated them at Hamadan, regaining the Armenian provinces which had been seized by the Turks in the preceding reign; but his sovraign lord, the Sâssanid rebels engaged with the Turkish envoys. Nadir caused him to be put in prison, and elevated his infant son, Abbas III., to the throne in 1732. The death of this puppet, in 1736, opened the way for the elevation of Nadir himself, who was crowned as Nadir shah, Feb. 26, 1736. He resumed the war with the Turks; and though totally defeated in the first two battles by the grand vizier Asman, turned the tide of fortune in the subsequent campaign, and granted peace to the Turks on condition of receiving Georgia. He also conquered Afghanistan, and drove back the invading Usbecks. His ambassador to the Great Mogul having been murdered along with his suite at Jelalabad, and satisfaction having been refused, Nadir, in revenge, ravaged the Northwest Provinces, and took Delhi, which he was, by the insane behavior of the inhabitants, reduced to the necessity of pillaging. With booty to the amount of £20,000,000, including the Koh-i-nûr (q.v.) diamond, he returned to the w. bank of the Indus. He next reduced Bokhara and Khouzmouz, restoring to Persia her limits under her sovereignty. He then ascended the throne, and having undergone a sudden change, he was formerly open-hearted, liberal, and tolerant; he now became suspicious, avaricious, and tyrannical. The empire groaned under his extortions, and he was finally assassinated on June 20, 1747. His only surviving son was carried to Constantinople, and thence to Vienna, where he was brought up as a Catholic under the surveillance of the empress Maria Theresa, and died a maj. in the Austrian service, under the title of baron Semlin. Nadir's tyranny has now been forgotten; and at the present day he is regarded with pride and gratitude as the "Wallace" of Persia.

NÉVUS, Cn., one of the earliest Latin poets, was born, probably in Campania, in the first half of the 3d c. B.C. In his youth, he served in the first Punic war; but about the year 255 B.C., he made his appearance at Rome as a dramatic writer. Of his life, we know little; but of his character, rather more. He was very decidedly attached to the plebeian party; and in his plays, satirized and lampooned the Roman nobles with all the virulence and indiscretion of a hot-blooded impetuous Campanian—that Gascon of ancient Italy! His rashness ultimately caused his banishment to Utica in Africa, where he died, 260 or 250 B.C. Besides his dramatic writings, comprising both tragedies and comedies, he wrote an epic poem, De Bella Punicâ, in the old Saturnian meter. Of these, only a few very unimportant fragments are extant, which may be found in Bothe's Ptolemaei Latinorum Sceniorum Fragmenta (Heidelberg, 1824), or Klunmann's collection of the same (Jena, 1843), enriched by a life of Névius, and an essay on his poetry. See also Selias's Poets of the Roman Republic (Edin. 1863).

NÉVUS (known popularly as mother-spot or mole) is a congenital mark or growth on a part of the skin. Sometimes it is merely a dark discoloration of the surface as described in the article Macule, in which case it is termed a mole and is perfectly harmless; but often it consists of a dense net-work of dilated blood-vessels, forming a redish or livid tumor, more or less elevated above the surface of the surrounding skin. The most frequent situations of these vascular moles are the skin and subcutaneous cellular tissue of the head; but they may occur elsewhere. The popular belief is, that they are caused by
the longing of the mother during her pregnancy for a lobster, or strawberry, or raspberry, or some other red-colored article of food, and that the influence of her mind has impressed upon the fetus a more or less vivid image of the thing she longed for; and hence the name of mother-spot. Sometimes these tumors waste away spontaneously, and give no trouble; but frequently they increase rapidly, invade the adjacent tissues, and ulcerate or slough, and thus become dangerous to life by hemorrhage. When these tumors do not show a tendency to increase, no treatment is necessary. When they are obviously increasing in size, the continual application of cold (by means of freezing mixtures), with moderately firm pressure, is sometimes of service; but a more certain method is to employ means to produce such an amount of inflammation as to obliterate the vessels; for this purpose, the seton, the application of nitric acid, and vaccination of the tumor, have been successfully applied. The injection of strong astringents, with the view of coagulating the blood, has sometimes effected a cure. If all these means fail, extirpation, either with the ligature or knife, must be resorted to; the ligature being regarded as the safest and best method. For the various methods of applying the ligature, the reader is referred to any standard work on operative surgery. If the tumor is in an inaccessible spot, as in the orbit of the eye, and is increasing rapidly, the only course is to tie the large vascular trunk supplying it. The common carotid artery has in several instances been tied with success for vascular tumors in the orbit.

NAGARJUNA, a village of Switzerland, in the canton of Glarus, and 5 m. n. of the town of that name, in a deep valley, is one of the most famous battle-fields in the country. Pop. 70, 2,490. Here, in 1888, 1500 men of Glarus, under Matthias am Bulh, overthrew an Austrian force of over 6000 to 8,000 men. The event is still celebrated yearly.

NAGATA, Lago, a curious small lake in Sicily, about two miles from Mineo, in Catania. It is situated in a plain, amidst craggy hills, and is of a circular form, commonly sixty or seventy yards in diameter, and about fifteen feet deep, but in dry weather shrinks to half its size; during occasionally it dries up. In most of it are three small craters, two of which perpetually send up water in jets to the height of two or three feet; the third is more intermittent. The water is greenish, or turbid, and has an odor of bitumen. The whole lake resembles a boiling caldron, from the escape of carbonic acid gas, rushing upwards with great force. The atmosphere is consequently fatal to birds attempting to fly across the surface of the lake, and to small animals which approach it to satisfy their thirst; and an approach to it is attended with headache and other painful circumstances to man himself. The ancients regarded these phenomena with great dread. They supposed that Pluto, when carrying off Proserpine, drove his fiery steeds through this lake, ere his descent to the lower regions. A temple was erected here to the gods of the two craters, the Dii Palici, who were supposed to be twin sons of Jupiter by the nymph Thalia. Pilgrims flocked to this shrine; and it afforded an inviolable asylum to slaves who had fled from their masters. An oath by the Dii Palici was never broken by the master, who found himself compelled here to come to terms with his runaway slave. No remains of the temple of the Dii Palici are left, as it is described as having been magnificent.

NAGA is, in Hindu Mythology, the name of deified serpents, which are represented as the sons of the Muni Kas'ya and his wife Kadru, whom they are also called Kadryayas. Their king is Sesa, the sacred serpent of Vishnu.

NAGAPATAM, a seaport of British India, on the Coromandel coast, in the province of Tanjor, 15 m. south of Kaurikul. It was taken by the Dutch in 1600, but fell into the hands of the English in 1781. Its site is an open sandy plain, elevated only three or four feet above sea-level. The port is visited by small vessels, and carries on some trade with Ceylon. Pop. at the census of 1871, 48,525.

NAGARJUNA, or NAGASENA, is the name of one of the most celebrated Buddhist teachers or patriarchs—the thirteenth—who, according to some, lived about 400 years, according to others, about 500 years, after the death of the Buddha Sakyamuni (i.e., 143 or 43 b.c.). He was the founder of the Mādhayamika school, and his principal disciples were Aryadeva and Buddhapālita. According to the tradition of the Buddhasthe, he was born in the south of India, in a Brahmanical family. Even as a child, he studied all the four Vedas; later, he traveled through various countries, and became proficient in astronomy, geography, and magical arts. By means of the last, he had several marvellous adventures, which ended in the death of three companions of his, but in his own escape. And, in the course of a Buddhist mendicant, in his conversion to Buddhism. Many miracles are, of course, attributed to his career as propagator of this doctrine, especially in the south of India, and his life is said to have lasted 300 years —See E. Burnouf, Introduction à l'Histoire du Bouddhisme Indien (Paris, 1844); Spence Harvy, A Manual of Buddhism (Lond. 1853); W. Washijew, Der Buddhismus, seine Dogmen, Geschichte und Literatur (St. Petersburg, 1860).

NAGASA, or NAGASAKI, a city and port of Japan, opened to foreign commerce by the treaty of 1858, on July 1, 1859, is situated in 32° 44'n. lat. and 129° 51' e. long., on the western side of a peninsula in the n. w. of the island of Kiues. Previously to 1859, it was the only port in Japan open to foreigners. The harbor, which is one of the most beautiful in the world, is about six miles in width, and three or four in length. To
a person inside, it appears completely land-locked, and it is surrounded by hills of about 1500 ft. in height. These are broken into long ridges and deep valleys; while the more fertile spots are terraced and under cultivation. The town of Nagasaki, which is about a mile in length, and three-quarters of a mile in width, lies on the n. side of the bay; its pop. is estimated at 70,000. The streets in general are clean and well-paved, but the houses are not particularly good, except those possessed by courtesans, and known as "ten-houses." On the hills behind the town are various temples, those dedicated to "Siufo," or the worship of the sun goddess, which is the old national religion of Japan, and those in which the Buddhistic worship, imported from China, is followed. The foreign settlement lies to the s. of the native town, the British, French, German, Prus-
ian, and Portuguese establish occupying the hilly ground back from the bay. On the opposite side of the bay, the Japanese have a steam-factory, under the direction of Dutch officers, and close by is the Russian settlement. The climate of Nagasaki is genial but variable. The trade of Nagasaki is inferior to that of Kanagawa. Sea-weed, salt-fish, and other articles are exported to China. The exports to Europe are mainly tea, tobacco, coal, ginseng, vegetable wax, and copper. The chief imports are cotton piece-goods, woolen goods, sugar, oils. The total value of imports in 1875 amounted to $1,617,000, and of the exports to close on $2,000,000. The import trade suffers from the absence of wealthy native merchants and of banking facilities. In 1879 the great new dock of Nagasaki, the largest in Japan, was in use. It is 460 ft. long by 89 broad, and 28 deep, and is expected to promote trade.

**NAGELFLUE**, the provincial name for a bed of conglomerate belonging to the Molhase (q. v.), which forms a considerable portion of the strata in the central region of Switzerland, between the Alps and the Jura. It is said to attain the enormous thickness of 6,000 and 8,000 ft. in the Rhigi near Lucerne, and in the Speer near Wesen.

**NAGESVAR**, the name under which the blossoms of the *Mesua ferrea* are sold in the bazaars of India. See GuTTIFERAE.

**NAGOA-YA**, a city in Japan, in the province of Owari, a few miles n. of the head of Owari bay, the seat of the Aichi ken, or prefecture, pop. 150,000. The city is regularly laid out, and the castle, built in 1610, is one of the finest among the feudal strongholds still standing intact. Two of its towers were long ornamented by huge images of rampant fish made of copper, covered with plates of solid gold. The great high road called the Tokkido, passes through the city, which has a bustling trade carried on with pack-horses and long narrow carts. Junks and steamers enter and clear at Miya, the sea port, a few miles through the forest to the southern coast. The way from the capital is lined with temples, cloison-ware, fans, carvings, and lacque work, are made chiefly for export. The art of enameling on porcelain in cloisons of metal threads originated here in 1872.

**NAGPUR**, an extensive inland province of British India, is under the chief commissioner of the Central Provinces. Its area is 22,242 sq. m., and its pop. in 1872 was 2,250,081; but this designation has been used to include a much greater area. The n. part of the province is mountainous in character, being traversed by spurs of the great Vindhyah range; the general slope of the surface is from n. w. to s. e., and the bay of Bengal receives the drainage of the country chiefly through the rivers Mahandi and Wain Gangi—the latter a tributary of the Godavari. The climate is not healthy, and is especially insalubrious in the extensive tracts of low marshy land which abound in the province. The Gonds (see INDA), supposed to be the aborigines, are the most remarkable class of the inhabitants. They rear fowls, swine, and buffaloes; but their country, forming the south-eastern tracts—about one-third of the whole—is covered with a dense jungle, swarming with tigers. In the more favored districts, where the inhabitants are more industrious, rice, maize, oil, and other seeds, and vegetables are extensively culti-
vated. In the capital of Nagpur, sometimes called the nababs of Berar, ruled over a state formed out of a part of the great Mahratta kingdom. The dynasty, however, died out in 1878, and the territory came into possession of the British. The province has five divisions—cap., Nagpur.
